C **T**Hus far forth haue we discoursed of all fortine and strange trees in a manner, such I meane as know not how to liue in any other places but where they naturally first did grow, and which wil- lingly go not into other countries, nor can abide their soile or aire. Goodleane may I now haue to write of Plants and Trees common to all lands, and namely, to ours of Italy, which may seeme to be the very Hort-yard and naturall garden that bare them all. This onely would I advertise the Readers and Learners to remember, that for this present we purpose to describe their natures and vertues onely, lea- ving out the manner of husbandrie that belongeth vnto them; albeit in their tending and keeping appea- reth the greatest part of their properties, and of Natures workes. And verily, I cannot chuse but marvelle still and neuer giue ouer, how it comes to passe, that the remembrance, yea, and the verie names of some trees which ancient Writers haue deliuered in their bookes, should be quite gone and abolished. For who would D not thinke, that our life should ere this haue gained much by the Maiesie of the Romane Empire, haue dis- covered all things by the meanes of the commerce we haue had with the vniuersall world, by the traffick, ne- gotiation, and societie I say that we haue entered into during the blessed time of peace which we haue enjoyed? considering that by such trade and entercourse, all things heretofore unknowne, might haue come to light. And yet for all this, few or none (beleeue me) there are who haue attained to the knowledge of many ma- ters which the old writers in times past haue taught and put in writing. Whereby wee may easily see, that our ancestours were either far more carefull and industrious, or in their industrie more happie and fortu- nate. Considering withall, that about two hundred yeares past Hesiodus (who liued in the very infancie of Learning and good letters) began his worke of Agriculture, and set downe rules and precepts for husban- E me to follow. After whose good example, many others hauing trauelled and taken like paines, yet haue put vs now to greater labour. For by this means we are not onely to search into the last inventions of later wri- ters, but also to those of ancient time which are forgotten and couered with oblivion, through the supine ne- gligence and generall idlenesse of all mankind. And what reasons may a man alledge of this drowsinesse, but that which hath lulled the world asleepe? the cause in good faith of all, is this and no other, Wee are readie to forgoe all good customes of old, and to embrace nouelties and change of fashions: mens minds now a daies are enuised and occupied about new fangles, and their thoughts be rolling; they wander and roue at random, their heads be euer running; and no arts and professions are now set by and in request, but such as bring F penence into our purses. Heretofore whilst Kings and Potentates contained themselves within the Domi- nion of their owne Nations, and were not so ambitious as now they bee, no marvelle if their wits and spirits kept still at home: and so for want of wealth and riches of Fortune, were forced to employ and exercise the gifts of their minde: in such sort as an infinite number of Princes were honoured and renowned for their singular knowledge and learning. Yea, they were more braue in port, and carried a goodlier shew in the World for their skill in Liberall Sciences, than others with all their pomp or riches: being fully persuaded and assured, that the way to attaine vnto immortalitie and euerlasting Fame, was by literature and not

by great possessions and large seignories. And therefore as learning was much honoured and rewarded in those daies, so arts & sciences tending to the common good of this life daily increased. But afterwards when the way was once made to enlarge their territories farther in the world, when princes and states began to make conquests and grow rich and mighty, the posterity felt the smart and losse thereby. Then began men to chuse a Senator for his wealth; to make a judge for his riches, and the election of a ciuill magistrate and martiall captain, to haue an eye and regard only to goods and substance, to land and lining: when rents and revenues were the chiefe and onely ornaments that made men seeme wise, just, politicke, and valiant. Since time that childlesse estate was a point looked into, and aduanced men into high place of authoritie and power, procuring them many fauorites in hope of succession, since time I say that euery man aimed and reached at the readiest meanes of greatest lūcre and gaine, setting their whole mind, and reposing their full content and ioy in laying land to land, and heaping together possessions; downe went the most precious things of this life, and lost their reputation: all those liberall arts which tooke their name of liberty and freedome (the soueraigne good in this world which were meet for princes, nobles, gentlemen and persons of great state) forwent that prerogative, and fell a contrarie way, yea, and ran quite to wracke and ruine: so as in stead thereof, base flatterie and scrutude be the only waies to arise and thriue by: whiles some practise it one way, some another, by flattering, admiring, courting, crouching, and adoring: and all, to gather good and get money. This is the onely marke they shoot at, this is the end and accomplishment of all their vices, prayers and desires. Inasmuch, as we may perceiue euery where, how men of high spirit and great conceit are giuen rather to honor the vices and imperfections of others, than to make the best of their owne vertues and commendable parts. And therefore we may full truly say, that life indeed is dead; Voluptuousnesse and Pleasure alone is almeys, and I to search into those things, that be perished and utterly forgotten, how small and base seuer some of them be, no more than I was affrighted in that regard, from the treatise and discourse of liuing creatures. Notwithstanding that I see Virgil (a most excellent Poet) for that cause only forbore to write of gardens and hort-yards, because he would not enter into such petty matters: and of those so important things that he handled, he gathered only the principall flowers, and put them downe in writing. Who albeit that he hath made mention of no more than 15 sorts of grapes, three kinds of Oliues, and as many of Peares, and sitting aside the Citrons and Limons, hath not said a word of any apples; yet in this one thing happy and fortunate hee was, For that his worke is highly esteemed, and no imputation of negligence charged upon him. But where now shall we begin this treatise of ours? What deserueth the chiefe and principall place, but the vine? in which respect Italy hath the name for the very souerainety of Vine-yards: inasmuch, that therein alone, if there were nothing els, it may well seeme to surpass all other lands, euen those that bring forth odoriferous spices and aromaticall drugs. And yet to say a truth, there is no smell so pleasant whatseuer, that out-goeth Vines when they be in their fresh and flourishing time.

CHAP. I.

¶ Of Vines, their nature and manner of bearing.

Vines in old time were by good reason for their bignesse reckoned among trees. For in Populonia, a citie of Tuscan, we see a statue of Iupiter made of the wood of one entire Vine, and yet continued it hath a world of yeares vncorrupt, and without worrne. Likewise at Massiles there is a great standing cup or boll to be seene of Vine-wood. At Metapontum there stood a temple of Iuno, bearing upon pillars of Vine wood. And euen at this day there is a ladder or paire of staires vp to the temple of Diana in Ephesus, framed of one Vine-tree, brought (by report) out of the Island Cypres, for there indeed vines grow to an exceeding bignesse. And to speake a truth, there is no wood more dureable and lasting than is the vine. Howbeit, for my part I would thinke that these singular pieces of worke before-named, were made of wild and sauage Vines: for that these our tame and gentle vines here planted among vs, are by cutting and pruning euery yere kept downe: so as all their whole strength is either drawne without-forth into branches, or els downward into the root for to put out new shoots euer fresh out of the ground: and regard is only had of the fruit and iuice that they do yeeld diuers waies, according to the temperature of the aire & climat, or the nature of the soile wherein they be planted. In the country of Campaine about Capua, they be fet at the roots of Poplars, and (as it were) wedded

vnite

A vnto them: and so being suffered to wind and claspe about them as their husbands, yea, & with their wanton armes or tendrils to climbe aloft, and with their ioints to run vp their boughes, they reach vp to their head, yea, and ouertop them: insomuch as the grape-gatherer in time of Vintage, puts in a clause in the couenants of his bargain when he is hired, that in case his foot should faile him, and he breake his neck, his master who sets him a worke should giue order for his funerall fire and tombe at his owne proper cost and charges. And in truth Vines will grow infinitely: and vnpossible it is to part them, or rather to pluck them from the trees which they be ioined and coupled vnto. Valerianus Cornelius making mention of many properties and singularities of a vine, thought this among the rest worthie of speciall note and remembrance, that one onely stocke of a vine was sufficient to compass and inuiron round about a good ferme-house or country messuage, with the branches & pliable shoots that it did put forth. At Rome there is one vine growing within the cloisturs of the Portches and galleries built by the Emperesse Livia, which running and trailing vpon an open frame of railes, couereth and shadoweth the ouert allies made for to walke in: and the same Vine yeeldeth one yere with another a dozen Amphores of good new wine yearly. An ordinarie thing it is, that Vines will surmount any Elms wherefoeuer, be they neuer so tall and lofty. It is reported, that Cynes the embassador of K. Pyrrhus, wondring at the vines of Aricia, for that they grew and mounted so high; would needs taste of the wine that came of their grapes: & finding it to be hard and tart, merrily scoffed and said, That by good right and justice they had done well, to hang the mother that bare such vnpleasant wine vpon so high a gibbet. Beyond the riuer Po in Italy, there is a tree growing which the peasants there call Rumbotinus, & by another name * Opulus; it puts forth great armes and boughs, and those spread abroad and beare a round compass; howbeit, the vines that be planted at the root of these trees, do fill and couer the said boughes: for yee shall haue the very old crooked branches of the Vine (bare as they be and naked of leaues) to wind about the armes, and cawle in manner of a serpent or dragon along the broader and flatter bafe of the boughes, and then the new shoots, top-twigs, and tendrils, wil diuide themselves to the utmost branches and shoots of the tree, that they will lode and clog her withal. These vines again grow sometime no taller than the ordinary height of a man of middle stature, and beeing supported and vnderpropped with stakes and forks, cleaue and cling thick together, and in this order fill whole vineyards. Others also there be, which with their excessive creeping vpon frames, with D their ouergrowne branches, and some artificiall help of the masters hand, spread so far euery way, that they take vp wide and large courts, ouerspreading not only the sides, but the very middest thereof. See what sundry sorts of vines euen Italy alone is able to afford! But in some prouinces without Italy, yee shall see a vine stand of it selfe without any prop or stay at all, gathering and drawing in her boughs and branches together: thus indeed the groweth but short, howbeit so close couched and trussed round, that the thickenesse makes amends for all. And yet other-whiles in some coasts the winds are so big and boisterous, that they wil not suffer them thus to grow vpright; as namely in Affricke, and Languedoc, the prouince of Narbon Vines being thus debarred to run vp in height, resting vpon their owne ioints and branches, and euer like to those that be laid along whiles they are a trimming, by deluing about their roots, and pruning their superfluous branches, traile and creepe too and fro along the ground, as weeds and herbes; and all the way as they spread, suck the humor of the earth into their grapes: by which meanes, no maruell it is, if in the inland parts of Affricke there be found some of those grapes bigger than pretty babes. And in no countrie are the grapes of a thicker skin than those of Affricke, wherupon it may well be, that they tooke the name * Duracina (i. hauing hard skins.) For infinite sorts there be of grapes, according to the difference obserued in their quantity and bignesse, in their colour, taste, stones, or kernels: and yet more stil, in regard of the diuers wines made of them. In one place they are of a fresh and bright purple, in another, of a glittering, incarnate, and rolate colour: and we shall haue them of a faire and liuely Greene. As for the white and black grapes, they be common euery where. The grapes Bumafti haue their name, for that they be so swelling and round, like strutting paps or dugs. The Date-grapes Dactyli, are long, both grape and kernel, fashioned in manner of fingers. Moreover, Nature seems to take her pleasure and make good sport in some kind of them; where yee shall find among them some that be exceeding great, others again that be as small, howbeit pleasant they are, and as sweet as the rest: and such be called Leptorrhag vs. Some last al winter long, being knit in bunches together, & so hangd aloft arch:

arch-wise in manner of a vault: with others they make no more adoe, but put them vp presently as they come from the Vine, into earthen pots, whiles they be fresh & in their vigor, and afterwards they are bestowed, well lapped ouer with their leaues, in other greater vessels ouer them, and for to keep them better, they be stoppt close with kernels heaped and piled vpon, sweating round about, to condite and preserve them in their naturall heat. Others they suffer to be dried in the smoke of smiths forges, whereby they get the very tast of infused wine, so ordered in the smoke. And in truth, *Tiberius Caesar* the Emperor gaue especial credit & name by his example to such grapes dried in the furnaces of Africk. For before his time, the Rhetian grapes & those that came out of the territory of Verona, were ordinarily serued vp to the table first, for the very best. As for the Raisins called *Passæ*, they took that name in Latine of their patience to endure their drying & confiture. Some grapes there be that are condite in Must or new wine, and so they drinke their owne liquor wherein they lie soking, without any other seething. Others againe are boiled in Must aboute said, vntill they lose their owne verdure, and become sweet and pleasant. Moreouer, yee shall see old grapes hang still vpon the Vine their mother, vntill new come: but within glasses, that a man may see them easily through: howbeit, to make them to last and continue in their full strength, as well those which be preserved in barrells, tuns, and such like vessels aforesaid, they vse the helpe of pitch or tarre, which they poure vpon the stalks that the cluster hangs to, and wherewith they stop close the mouth of the said glasse. It is not long since that there was a deuise found, that wine of it selfe (as it came naturally from the grape growing vpon the vine) should haue a smack and sent of pitch. And surely this kind of Pitch wine, brought the territory about Vienna into great name reputation: & before that this vine was known, those of Auern, Burgundy, and the Heluij, were in no request at all. But these deuises as touching vines & wines, were not in the daies of the Poet *Virgil*, who died about 90 yeres past. But behold what I haue to say more of the Vine tree: the vine wand is now entred into the camp, and by it our armies are ranged into battalions: nay, vpon the direction thereof depends the main estate of our soueraigne Empire: for the Centurion hath the honour to carry in his hand a Vine-rod: the good guidance and ordering whereof aduanceth after long time the centeniers (for a good reward of their valorous and faithfull seruice) from the leading of inferior bands, to the captainship of that regiment and chiefe place in the army, vnto which the maine standard of the Eagle is committed: yea, and more than that, the Vine wand chastiseth the trespasses and lighter offences of the souldiers, who take it for no dishonor nor disgrace to be thus punished at their Centurions hand. Ouer and besides, the planting of Vineyards hath taught martiall men how to approach the wals of their enemies, to giue an assault vnder a frame deuised for the purpose, which therupon took the name of Vine. Lastly, for medicinal vertues in phisick, the Vine is so profitable to mans health, that the vse of it alone is a sufficient remedy for the distemperature of mans body, caused by wine it selfe.

CHAP. II.

¶ Of the diuers kinds of wines.

D*emocritus* was the onely Philosopher euer known, who made profession to reduce all the sorts and kinds of vines to a certaine number, and indeed he vaunted and made his boast that he had the knowledge of all things that were in Greece. All others besides himselfe and those coming neerer to the truth (as that appeare more euidently by the variety of wines) resolutely haue set downe, that there be infinit sorts of Vine-trees. Looke not therefore at my hands, that I should write of them all, but onely of the principall: for that in truth there bee in manner as many and as sundry kinds of them, as are of grounds. Wherefore I will content my selfe, and thinke it sufficient to shew those that be singular and most renowned among them, or such as haue some secret propriety worth admiration. And first to begin with the Aminean Vines, all the world giueth them the chiefe praise and greatest name, as wel for their grapes, of so lasting and durable a nature, as for the wine made thereof, which in all places continues long in vigor, & is euer the better for the age. And hereof there be fise sundry sorts. Of which, the kindly Vines named Germanæ, haue both lesse grapes and grains within, but they burgen and bloom better than others: and after the floure is gon, they can abide both rain and tempest: but the second kind (which is the greater) is not so hardy: howbeit, lesse subiect to wind and weather

Ather when they be planted to run vp a tree, rather than to creepe vpon a frame. A third sort are called *Gemellæ*, for that their grapes grow double like twins. & they be very harsh and in taste vntoothsome, howbeit their vertue and strength is singular. The smaller sort of these take harm by the South wind: but all other winds nourish them, as we may see in the mount *Veluvius*, and the little hills of *Surrentum*: for in all other parts of Italy, ye shal neuer finde them but wedded to trees, and growing vpon them. As for the fift kind of these Amminean vines, they be called *Lanata*, so freezed they are with a kind of down or cotton, inso much as we need not wonder any more at the *Seres* or *Indians* for their cotton and silken trees. The first kind of these Amminean grapes come soonest to their ripenesse and perfection, and most quickly do they rot & putrifie. Next to these Amminean vines, those of *Nomentum* are in most account: and for that their wood is red, some haue called them *Rubellæ*. These grapes yeeld no great plenty of wine, but in stead thereof their stones and kernels, and other refuse remaining, grow to an exceeding big cake: howbeit, this property they haue. The frost they will endure passing well, lesse harme they take also by raine than drought, and thriue better in cold than heat: and therefore in cold and moist grounds they excell and haue no fellow. Of these vines, they are more plentifull which beare grapes with smaller stones, and leaues with lesse cuts and iags indented. As touching the *Muscadell* vines, *Apiana*, they tooke that name of bees, which are so much delighted in them, and desirous to settle and feed of them. Of two sorts they are: and both carry cotton & down. Howbeit, this difference is between them, that the grapes of the one will be sooner ripe than the other, and yet there is neither of them both but vchastly enough. These *Muscadell* grapes like wel and loue cold countries: and yet none sooner rot than they, if showers take them. The *Muscadell* wines are at the first sweet: but with age become harsh and hard, yea, and red withal. And to conclude, there is not a grape that ioies more to hang vpon the vine, than it doth. Thus much of the very floure of Vines, and the principall grapes that be familiar and proper vnto our countrey of Italy, as their natiue soile.

The rest be strangers come out of *Chios* or *Thasos*. As for the Greeke grapes of *Corinth*, they be not in goodnes inferior to the Aminean aforesaid. They haue a very tender stone within: and the grape it selfe is so small, that vnlesse the soile be exceeding fat and battle, there is no profit in planting and tending such vines. The quick-fets of the vine *Eugenia* were sent vnto vs from the *Taurominitane* hills in *Sicily*, together with their syname pretending anoble & gentle race. Howbeit, they are neuer in their kind with vs, but only in the Alban country: for if you transplant them, they proue very bastards and changelings presently. And in faith, some vines there be that take such an affection and loue to a place, that all their goodnesse and excellency they will leaue there behind them, and neuer passe into another quarter whole and entire as they be in their own nature. Which euidently is to be seen in the Rhetian vine, & that of *Savoy* and *Daulphnie*, of which in the chapter before wee said, that it gaue the taste of pitch to the wine made thereof: for, these Vines at home in those countries are much renowned for the said tast: but elswhere if they be transplanted, they loose it whole, and no such thing may a man acknowledge in them. Howbeit, plentifull such are, and for default of goodnesse, they make amends & recompence in abundance of wine that they yeeld. As for the vine *Eugenia*, it takes well in hot grounds. The Rhetian likes better in a temperat soile. The *Allobrogian* Vine of *Savoy*, and *Daulphine* delights most in cold quarters: the frost it is that ripens her grapes, and commonly they are of colour black. Of all the grapes aboue rehearsed, the wines that be made, the longer they be kept, the more they change colour, and in the end become white, yea, though they came of blacke grapes, and were of a deep colour at first. Now for all other grapes whatsoeuer, they are reckoned but base in comparison of the former. And yet this is to be noted and obserued, in that the temperature of the aire may be such, and the soile so good, that both the grapes will endure long, and the wine beare the age very well. As for example, the Vine *Fecenia*, and likewise *Biturica*, that bloometh with it, which beare grapes with few stones within: their floures neuer miscarry, for they euer preuent and come so timely, that they be able to withstand both winde and weather. Howbeit, they do better in cold places than in hot: in moist also, than in dry. And to say a truth, there is not a vine more fruitfull, & yeelding such store of grapes growing so thick together in clusters: but of all things it may not away with variable and inconstant weather: let the season be staied and settled, it matters not then whether it be hot or cold, for wel it will abide the one & the other alone, hold it neuer so long. The lesser of this kind is held for the better.

Howbeit

Howbeit, in chusing of a fit soile for this vine, it is much ado to please and content it: in a fat ground it soone rots; in a light and lean, it will not grow at all: very choise it is: therefore, dainty, and nice, in seeking a middle temper betwene, and therefore it taketh a great liking to the Sabine hills, and there it loues to be. The grapes that it bears, be not so beautiful to the eye, but pleasant to the tooth: if you make not the more hast to take them presently when they be ripe, they will fall off, although they be not rotten. This vine puts forth large and hard leaues, which defend the grapes well against haile-stones.

Now there are besides certain notable grapes of a middle colour between black and purple, and they alter their hue oftentimes; whereupon some haue named them *Varianæ*: and yet the blacker they be, the more they are set by: they beare grapes but each other yeare, that is to say, this yeere in great plenty, the next yeere very little: howbeit, their wine is the better when they yeeld fewer grapes. Also there be 2 kinds of vines called *Pretianæ*, differing one from the other in the bignesse of the stones within the grape: full of wood and branches they are both: their grapes are very good to be preserved in earthen pots: and leaved they be like to *Smallach*: they of *Dyrhachium* do highly praise the Roial vine *Basilica*, which the Spaniards call *Cocolobis*. The grapes grow but thin vpon this plant: they can well abide all South winds, and hot weather: they trouble and hurt the head, if a man eat much of them. In Spaine they make 2 kinds of them; the one hauing a long stone or grain within, the other a round: these be the last grapes that are gathered in time of vintage. The sweeter grape that the *Cocolobis* bears, the better is it thought: howbeit that which was hard and tart at the first, will turne to be pleasant with keeping; and that which was sweet, will become harsh with age: and then they resemble in tast, the *Albane* wine; and men say, there is an excellent drinke made thereof, to help diseases and infirmities of the bladder. As touching the wine *Albuelis*, it bears most grapes in the tops of trees, but *Vistula* is more fruitfull beneath toward the root: and therefore if they be set both vnder one and the same tree, a man shall see the diuersitie of their nature, and how they will furnish and enrich that tree from the head to the foot. There is a kind of blacke grape named *Inerticula*, as a man would say, dull and harmlesse; but they that so called it, might more iustly haue named it *The sober grape*: the wine made thereof is very commendable when it is old, howbeit nothing hurtfull: for neuer makes it any man drunke; and this property hath it alone by it selfe. As for other vines, their fruitfulness doth commend them; and namely aboute all, that which is called *Heluenaca*, whereof be two kinds, the greater, which some name *The long*; and the smaller called *Arca*: not so plentifull it is as the former, but surely the wine thereof goes downe the throat more merrily. It differs from the other in the perfect and exquisite roundnesse of the leafe, as it were drawn by compasse: but both the one and the other is very slender, and therefore of necessity they must be underpropped with forkes, for otherwise they will not beare their owne burden, so fruitfull they be. They delight greatly to grow neare the sea-side, where they may haue the vapors of the sea to breath vpon them: and indeed their very grapes haue a sent and smell of a brackish dew. There is not a vine can worse brooke Italy. Her grapes are small, they hang thin and rot euen vpon her: and the wine made thereof, will not last aboute one Summer: and yet on the other side there is not a vine that liketh better in an hungry and lean ground. *Gracinus* (who otherwise compiled his worke out of *Cornelius Celsus* in manner word for word) is of this opinion, That this Vine could loue Italy well enough, and that of the owne Nature it mislikes not the Countrey: but the cause why it thriueh no better there, is the want of skil and knowledge to order and husband it as it ought to be; for that men strue to overcharge it with wood, and load it with too many branches: and were it not that the goodnesse of a fat and rich soile maintained it still, beginning to faint and decay, the fruitfulness thereof were enough to kill it. This vine (by report) is never blasted: a singular gift verily of Nature, if it be true, That any plant or tree should be so exempt from the iurisdiction (as it were) of the Heauens, that they had no power to doe it harme. The Vine *Spionia*, which some call *Spinca*, feareth no extremities of heat: her grapes prosper well in Autumne and much abundance of rain: This is the only grape that is nourished with foggie mists, and therefore it likes no place well but the territorie of *Ravenna*. The vine *Venacula* (which is counted one of the best for kindly blooming & shedding the flowers, and for grapes most meet to be preserved and kept in pots) the *Campaines* rather name *Sirculus*; others *Stacula*: and they of *Tarracina* call it *Numisiana*: and as they say, the grape thereof hath no singularity nor vertue in it self, but only according to the soile where

A it groweth: howbeit those that grow about *Surrentum*, haue the most strength, and are excellent to be preserved in vessels; I mean, as far as vp to the hill *Vesuvius*: for there also is the vine *Murgentina*, the best of all those that come out of *Sicily*, which some call *Pompeiana*, of *Pompeii*, a town within the kingdome of *Naples*: & being got once into *Latium*, it beares grapes abundantly: like as the vine *Horconia* in *Campaine*, yeeldeth plenty of grapes with the best, but good they are for nothing saue onely to be eaten at the table. As for the grape *Marica*, it will last and indure a long time; it feareth neither winde nor tempest, nor any blast of planet: blacke it is, and hath black stones: howbeit the wine that it maketh, waxes red with age, namely, if it be long kept.

B

CHAP. III.

¶ Of the diuers kinds likewise of Vines, according to the properties of the places and regions where they grow.

Hitherto we haue treated of the sundry sorts of vines in general: now wil we write of them according to the nature of the places and regions, which are proper and familiar vnto them; or, as they be mingled one with another, by transplanting or grafting. And first and formost, the vine *Tudernis*, also *Florentia* (bearing the name of the city *Florence*) are peculiar to the *Tuscans*: but about *Aretium*, there is no talke both for plenty and goodnesse, but of the *Talpana*, *Etesia*, and *Consennia*. The *Talpana* grape is blacke as the *Mouldwarpe*, whereof it taketh the name, but yet doth it yeeld a white wine. The *Etesia* vine (so called of the wines *Etesia*) is a deceitfull plant, and often misleth and faulteth; but the more grapes it beareth, the better wine it yeeldeth and more commendable: may this is strange and wonderful in it, In the mids of this fruitfulness of hers, she giueth ouer suddenly and dieth. The vine *Consennia*, bringeth blacke grapes: the wine will not last, but the grapes will keepe and continue passing long: the vintage thereof is fiftene daies after all other: it beareth ordinarily her full burden, but the fruit is onely good for meat to be eaten, and not for wine to be drunke. The leaues of this vine (in manner of the wilde vine *Labrusca*) before they fall, become as red as blood. This property happeneth to some others besides; but take it for a certaine token of the worst vines. The vine and grape *Irtiola*, is proper vnto *Vmbria*, to the territorie of the *Meuenates*, and the *Picene* countrey: like as that which they call *Pumula*, to the *Amiternine* region. They haue among them also another kinde, named *Bannanica*: and although it oftentimes doth not take, yet they loue the plant and cherish it. There is a grape which they call the *Borough* or *Burgois* grape, after the name of the burrough town *Pompeii*; and yet there is more plenty of them about the city *Clusium*: the *Tiburtins* also, named their grapes after their town *Tybur*: yet of late daies they haue found another sort, which of the resemblance of oliues, is called the *Oliue* grape: and in truth, this is the last grape of any account, to this day known to haue bin found out. The *Sabins* and *Laurentines* only are acquainted with the grape *Vinaciola*: for wel I wot, that the vines *Gauranæ* came first out of the territory of *Falerij*, and thereupon were named *Falernæ*: but transplant them from thence whithersoever you will, they wil very quickly degenerat in all places, and proue bastard. Moreover, some haue made a seuerall kind by it self of the *Tarentine* vine, which brings forth an exceeding sweet grape. As for the grapes called *Capnias*, *Bucconiatas*, & *Tarrupia*, there is no vintage of them in the vineyards of the hills about *Thurinum*, before the cold frost. As for the citizens of *Pisa*, they set great store by the grapes *Pharicæ*: like as *Modenna* by those called *Prusiniæ*, which are very black stone & al yet the wine thereof with 4 yeeres will turn to a paller and whitish colour. A strange thing it is which men report of a certaine grape, that euermore will turne with the Sunne: and thereupon it is called *Streptos*: as also that we in Italy are delighted with the French grapes: and they in France beyond the Alpes, are as much in loue with ours in the *Picene* countrey. *Virgil* hath made mention of other grapes, namely, *Thasie*, *Mareotides*, and *Lageræ*, besides many other outlandish plants, not at this day to be found throughout all Italy: howbeit there be yet many vines of good mark & wel accepted of, not for any wine that they yeeld, but only for their grapes which they carry to wir, *Ambrosiaca*, and *Duracina*, which may be kept hanging still vpon the vine, without any vessel to inclose them: so durable be they and hardy, against cold, heat, wind, and raine, or any weather whatsoeuer. As for the vine *Orthampelos*, it needs neither tree to climb on, nor

N n

forkes

forkes to support it, but is able to maintain and vphold it selfe vpright. But the Dasty lides (so called for that they beare not wood aboue a finger thicke) cannot so do: for they must be shored and vnderpropped. Of all vines, the Columbine yeeld most gleaning, for that the gatherers leaue behind them greatest store of small grapes: and so do the purple grapes, named also Bimammia (as one would say, with two teats or bigs) more than the rest; seeing that they beare not small grapes, but put forth new great ones indeed, after the other be gathered and gone. In like manner, the vine Tripedanea, which took that name of the measure of 3 foot. Semblably the vine Scirpula, the grapes whereof seem as if they were Raisins of the sun, dried already. Moreover in the maritime Alps toward the sea-side, there is a kind of Rhetian vine, but far inferior to that other aboue-mentioned and so much commended for the relish of pitch that it giueth to the wine made of her grapes: for these about the Alps be little and small, and albeit they beare grapes thicke, yet the wine thereof comes far short of the other, and is more degenerate: howbeit the skin of the grapes is of all other the thinnest, hauing but one kernel within, which they call Gigarton, and the same very small; and a man shall not find a bunch, without one or two passing great grapes aboue the rest: there is also a kind of black Aminean grape, which some name Syriaca: likewise the grape of Spain, which of the base and common kinds carries the greatest credit, and is most commended. As touching both vines and grapes that run and traile vpon frames; there be those which are called Efcaria, good only for to eat, and namely those which haue grains or stones like to Ivie berries, as well white as black. Grapes resembling great dugs, named therupon Bumasti, both black and white, are carried vpon frames in like sort. But all this while we haue not spoken of the Egyptian and Rhodian grapes, ne yet of the Ounce-grapes, whereof every one weighs a good ounce, and thereupon took that name. Item, the grape Pucina, the blackest of all others: the Stephanitis also, wherein Nature hath seemed to disport her selfe, for the leaues run among the grapes in manner of a garland plaited with them. Moreover, the market-grapes called Forenses, they grow and are ripe with the soonest; vendible at the very first sight, and sold with the best, and most easie to be carried from market to market. But contrariwise, the ash-coloured grape Cinerea, the silk-russet grape Ravuscula, the ashe-hued grape Afnisca, please not the eye, but are presently reiecte: and yet the Fox-tailed grape Alopecis, (for that it resembles Rainards taile) is not so displeasing nor so much discommended as the former. About a cape or crest of the hill Ida, which they call Phalacra, there is a vine named Alexandrina, small of growth, and puts forth branches of a cubit in length: the grapes be black, as big as beans; the pepin or kernell within, soft, tender, and exceeding small; the bunches are crooked, full of grapes, passing sweet; and finally the leaues little, round, and not cut or jagged at all. Within these seuen yeres last past, about Alba Eluia, a city in Languedock or the prouince of Narbon, there was found a vine, which in one day both floured and shed her floures: by which meanes most secured it was from all dangers of the weather. They call it Narbonica, or the vine of Languedock: and now it is commonly planted all that prouince ouer, and every man desireth to store his vineyard therewith.

CHAP. IIII.

¶ Notable considerations about the husbandrie and ordering of Vineyards.

That noble and worthy Cato, the first of that name, renowned among other dignities for his honorable triumph, and the incorrupt administration of his Censorship, and yet more famous and renowned to posterity for his singular knowledge and learning: and namely for the good precepts and ordinances tending to all vertues and commendable parts, which he left in memory for the people of Rome: & principally touching agriculture [as he was by the common voice and generall accord of that age wherein he liued reputed for an excellent husbandman, and one who in that profession had neither peere nor second that came neere vnto him.] This Cato (I say) hath in his workes made mention but of a few kinds of vines: and yet some of them already be growne out of knowledge, so as their verie names are quite forgotten. Yet neuertheless his opinion and judgement would be set downe in particular, as it may be gathered out of his whole treatise: to the end that we might both know in euery kind of vine which were of most account in his daies (to wit, in the 600 yere after the foundation of Rome, about the

A the time that Carthage and Corinth were forced and woon, when he departed this life:) and also learn how much we haue profited and proceeded in good husbandry and agriculture, from his death vnto this present day, namely for the space of 230 yeres. As concerning vines and grapes therefore, thus much hath Cato deliuered in writing, and in this manner following. All places or grounds (quoth he) exposed to the Sun-shine, and which in other regards shall be found good for to plant vineyards in, (yet they be employed for the lesse Aminean, for both the Eugeniai vines, and the smaller Heluine: Vine; In euery tract that is more grosse, thicke, and mistie, looke that you see the greater Aminean, or the Marigentine: the Apician also, and the Lucane Vine. All other vines, and the common mingled sort especially, will agree well enough with any ground. The right keeping of grapes, is in a small binne wine of the second running. The grapes Duracina, and the greater Amineans, are good to be hanged, or else dried before a blacke-smithes forge, and so they may be well preserved and good for Raisins of the Sun. Note what the precepts of Cato be; neither are there any of this argument more ancient, left vnto vs written in the Latine tongue. Whereby we may see, that we liue not long after the very first rudiments and beginnings of knowledge in these matters. [But by the way, the Amineans, last named, Varro calleth Scantians.] And in very truth, few there be euen in this our age, who haue left any rules in forme of Art, as touching the absolute skill in this behalfe. Yet such as they be, and how few foeuer, we must not leaue them behinde, but so much the rather take them with vs; to the end it may be knowne, what reward & profit they met with, who travelled in this point of husbandry: reward, I say, and profit, which in euery thing is all in all.

C To begin therefore with Acilius Sthenelus [or Stelenus,] (a mean commoner of Rome, descended from the race of Libertines or Slaues newly enfranchised) he attained to the highest glory and greatest name of all others: for hauing in the whole world not aboue 60 acres of land lying all in vineyards within the territory of Nomentum, he plaied the good husband and so well therein, that he sold them again at the price of 400000 Sesterces. There went a great bruit and fame likewise of one Veruleus Aegialus, in his time a man but of base condition by birth, and no better than the former, (namely, come of the stocke of freed-men) who by his labor & husbandry, greatly enriched a domain or siting at Liternum in Campaine: and the more renowned he was by occasion of the fauour of so many men affectionate vnto Africanus, whose very place of exile he held in his hands and occupied so well: for vnto Scipio, the aboue-said Liternum, appertained. But the greatest voice and speech of men was of Rheimnius Palamon (who otherwise by profession was a famous and renowned Grammarian) for that he by the means and helpe of the foresaid Sthenelus, bought a ferme within these twenty yeres for 600000 Sesterces in the same territorie of Nomentum, about ten miles distant from Rome, lying somewhat out of the high way. Now is it well knowne farre and neare, of what price and account all such fermes are, and how cheape such ware is lying so neere to the city side: but amongst the rest, this of Palamons in that place was esteemed most cheap and lowest prised, in this regard especially, That he had purchased those lands, which through the carelesnesse & bad husbandry of the former owners, lay neglected and fore-let, & were not of themselves thought to be of the best soile, chosen and piked from among the worst. But being entred once vpon those grounds as his owne iucode and possession, he set in hand to husband and manure them, not so much of any good mind and affection that he had to improve and better any thing that he held, but vpon a vaine glory of his own at the first, whereunto he was wonderously giuen: for he makes fallows of his vine-plots anew, and delueth them all ouer again, as he had seen Sthenelus to do with his before: but what with digging, stirring, and medling therewith, following the good example and husbandry of Sthenelus, hee brought his vineyards to so good a passe within one eight yeres, that the fruit of one yeres vintage was held at 400000 Sesterces, and yeelded so much rent to the lord: a wonderfull and miraculous thing, that a ground should be so much improved, in so small a time! And in very truth, it was strange to see what numbers of people would run thither, onely to see the huge and mighty heaps of grapes gathered in those vineyards of his: and all idle neighbors about him, whose grounds yeelded no such increase, attributed all to his deepe learning, and that he went to it by his book, & had some hidden speculation aboue other men; objecting against him, that he practised Art Magicke, and the blacke Science. But last of all, Annas Seneca, esteemed in those daies a singular clerke, and a mighty great man (whose ouermuch Learning and exceeding power cost him his ouerthrowing in the end) one who had good skill and

judgement in the world, and vsed least of all others to esteeme toies and vanities, brought this ferm into a greater name and credit: for so far in loue was he of this possession, that hee bought out *Palamon*, and was not ashamed to let him go away with the pricke and praise for good husbandry, and to remoue him into other parts where he might shew the like cunning: and in one word, paid for these foresaid vineyards of his fourfold as much as they cost, not about ten yeres before this good husbandry was bestowed vpon them. Certes, great pity it is, that the like industry was not shewed and imploied in the territories about the hills *Cecubus*, & *Setinus*, where (no doubt) it would haue well quit all the cost, considering that many a time afterwards, euery acre of vineyard there, yeelded seuen Culei, that is to say, 140 Amphores of new wine one yere with another. But lest any man should thinke, that wee in these daies haue surpassed our ancestors in diligence, as touching good husbandrie; know he, that the aboue named *Cato* hath left in writing, How of an acre of vineyard there hath arisen ordinarily * ten Culei of wine by the yere. Certainly these be effectual examples and pregnant proofes, that the hardy and aduenturous voiajes by sea, are not more aduantageous; ne yet the commodities and merchandise, and namely Pearls, which be fet as far as the red sea and the Indian Ocean, are more gainefull to the merchant, than a good ferm and homestead in the countrey, well tilled and carefully husbanded.

As touching the wines in old time, *Homer* writes, that the Maronean wine made of the grapes growing vpon the sea coasts of Africk, was the best, & most excellent in his daies. But my meaning is not to ground vpon fabulous tales & variable reports, as touching the excellency or antiquitie of wine. True it is, that *Aristeus* was the first, who in that very nation mingled honey with wine, which must needs be a passing sweet and pleasant liquor, made of two natures so singular as they be of themselves. And yet to come againe to the foresaid Maronean wine, the same *Homer* saith, That to one part thereof, there would be but 20 parts of water: and euen at this day, that kind of wine continues in the said land of the same force, and the strength thereof will not be conquered nor allaid. For *Mutianus* who had bin thrice consul of Rome, & one of those that latest wrote of this matter, found by experience (being himselfe personally in that tract) that euery sextar or quart of that wine, would beare 8 of water: who reports moreouer, that the wine is of colour blacke, of a fragrant sweet smell, and by age comes to be fat and vnctious. Moreouer, the Pramian wine (which the same *Homer* hath so highly commended) continueth yet in credit and holds the name still: it comes from a vineyard in the countrey about *Smyrna*, neere to the temple of *Cybele* the mother of the gods. As for other wines, no one kind apart excelled other.

One yere therewas, when all wines proued passing good; to wit, when *L. Opimus* was Consul, at what time as *C. Gracchus* a Tribune of the Commons (praefising to sow sedition within the city among the common people) was slaine: for then such seasonable weather happened, and so favorable for ill fruit, that they called it (*Coctura*) as a man would say, the ripening time; so beneficiall was the Sun to the earth: and this fell out in the yere after the natiuity and foundation of the city of Rome, 634.

Moreouer, there be some wines so durable, that they haue beene knowne to last two hundred yeaes; and are come now by this time to the qualitie and consistence of a rough, sharpe, and austere kind of hony: and this is the nature of all when they bee old: neither are they potable alone by themselves, vnlesse the water be predominant; so tart they are of the lees, and so musty withall, that they are bitter againe. Howbeit a certaine mixture there is of them in a very small quantity with other wines, that giues a pretie commendable tast vnto them. Suppose now that according to the price of wine in those daies of *Opimus*, euery Amphore were fet but at an hundred Sesterces, yet after the vsurie of six in the hundred yearly (which is the ordinary proportion and a reasonable interest among citizens, for the principall that lieth dead and dormant in stock) by the hundred and sixtieth yere after the said Amphor was bought (which fell out in the time that *C. Caligula Caesar* the son of *Germanicus* was Emperor) no maruell if an ounce in measure of the same wine (to wit, the twelfth part of a Sextarius) cost * so many Sesterces: for as we haue shewed by a notable example, when we did set downe the life of *Pomponius Secundus* the Poet, and the feast that he made to the sayd Prince *Caligula*, there was not a * Cythus of that wine drawne, but so much was paid for it. Loe what a deale of money lieth in these wine-cellar, for keeping of wine! And in very truth, there is nothing more gainfull nor groweth to a better

A better reckoning than it, for twenty yeres space after it is laid vp: neither is there greater losse againe by any thing, if ye passe that terme, by reason that the price will not grow and arise accordingly: for seldom hath it bin knowne to this day (and neuer but at some excessiue riot and superfluous expence of wine) that an Amphore hath beene sold for a thousand Sesterces. True it is indeed, that they of Vienna only haue made better reckoning of their wines, and sold them deerer; I meane those that giue a taste of pitch (the feuerall kinds whereof wee haue deliuered before;) but they are thought so to do among themselves only, and for the loue of their countrey, that it might haue the names of wines, so deerer and costly. To conclude, this wine of Vienna, is reputed colder than the rest; when the question is of cold drinke, and that the body is to be cooled.

CHAP. V.

¶ Of the Nature of Wine.

THE nature and property of wine, is to heat the bowels within, if it be drunke; and to coole the exterior parts, if it be applied outwardly. And here it shall not be amisse to rehearse in this very place, that which *Androcydes* (the noble, sage, and wise Philosopher) wrote vnto *K. Alexander* the Great, for to correct and reforme his intemperate drinking of wine, whereto he was very prone and ouermuch giuen. My good Lord (saith he) remember when you take your wine, that you drinke the very blood of the earth: Hemlock (you know sir) is poison to man, euen so is wine to Hemlock. Now if that Prince had bin so wise as to haue obeyed these precepts of his, certes, he could neuer haue killed his best friends as he did, in his fits of drunkennesse. In sum, this may be truly said of wine, that being taken soberly and in measure, nothing is more profitable to the strength of the body; but contrariwise, there is not a thing more dangerous and pernicious, than the immoderate drinking thereof.

CHAP. VI.

¶ Of kindly Wines made of the best Grapes.

WHo doubteth, that some Wines be made more pleasant and acceptable than others? nay out of the very same vat ye shall haue wines not alike in goodnesse, but that some go before their brethren, pressed though they be at one time, and from the same kinde of grape: which may be long either of the vessell whereinto they be filled, or of some accidental occasion: and therefore as touching the excellency of wine, let euery man be his own taster and judge. The Emperesse *Julia Augusta* would commonly say, That she was beholden to the Pucine wine for liuing as she did 82 yeaes: for the neuer vsed to drink any other. This wine came of the grape that grew along the Adriaticke sea, or Venice gulfe, vpon a stony and raggy hill, not far from the source or spring of the riuer *Timavus*, nourished with the vapors breathed from the sea; and many Amphores there were not drawne thereof at a vintage: and by the iudgement of all men, there is not a wine more medicinable than it is. I would thinke verily therefore, that the wine *Pyctanon* (which the Greekes so highly praise) is the very same; for it cometh from the coasts of the Adriaticke sea. The Emperor *Augustus Caesar* preferred the *Setine* wine before all others: and after him in manner, all the Emperors his successors, for the ordinary experience they found thereby, That lightly the liquor of that wine would not hinder digestion nor breed raw humors in the stomach: and this wine cometh of the grape about the towne *Forum Appij*. Before that time, the wine *Cæcubum* was in best account; and the vines which yeelded it, grew to the Poplars in the marsh grounds within the tract of *Amyclæ*. But now is that Wine cleane gone, as well through the negligence of the peasants of that countrey, as the streights of the place: and so much the rather, by reason of the ditch or trench which *Nero* caused to be made nauigable, beginning at the lake or gulfe *Baïanus*, and reaching as far as to *Ostia*. In the second degree of excellency, are ranged the wines of the *Falerne* territorie, and principally that which came from the vineyards *Fauſtian*: and this excellency it grew vnto, by passing good order and careful husbandry. Howbeit this wine also in these daies beginneth to grow out of name and request, whiles men loue rather to haue plenty from their vines, than otherwise lay for the goodnesse thereof. Now these *Falerne* vineyards, begin at the Campanie bridge on the left hand as men go to the city colony erected by *Sylla*, and lately laid to *Capua*, & vnder the iurisdiction thereof.

* 15 according to Ful. Præstant.

* Bud. 22. Scit.

* Jan ounce and a halfe.

therof. But the Fauſtian vineyards lie about 4 miles from a village neere Cedia, which village is from Sinueſſa ſix miles diſtant. And to ſay a truth, this Fauſtian wine is inferiour to none in reputation: ſo piercing and quicke it is, that it will burne of a light flame; a propertie that you ſhall not ſee in any other wine. Three forts there be of theſe Falerne wines: the firſt be hard and harſh; the ſecond ſweet and pleaſant; the third, thin and ſmall. But ſome haue diſtinguiſhed them in this wiſe: thoſe that come from the top of the hills, be called Gaurane wines; from the mids, Fauſtian; and laſt of all from the bottom and foot thereof, the Falerne. But by the way this would not be forgotten, That the grapes whereof be made theſe wines of excellent excellēt, are nothing pleaſant to the taſt for to be eaten. As touching the Albane wines from about Alba neere the city of Rome, they reach to the third ranke in goodneſſe, for a certain varietie they haue in their taſt: ſweetiſh they be, and yet otherwhiles they haue an vnripe & harſh relliſh of the wood, & taſt like the hedge-wine. In like maner the wines of Surrentum, & namely thoſe of grapes growing only in vineyards, are excellent good for weak perſons that be newly recouered of ſickneſſe; ſo ſmall they are, and wholeſome withal. And in truth, *Tyberius Caſar* was wont to ſay, That the Phyſitians had laid their heads together, and agreed to giue the Surrentine wine ſo great a name; for otherwiſe it was no better than a very mild and pleaſant vine-gér, and *C. Caligula* (his ſucceſſor in the Empire) vſed to ſay of it, That for a wine that had loſt the heart and was a going, it was very good. The Maſſike wines, which come from the Gaurane hills looking toward Puteoli and Bajæ, come nothing behind the reſt, but ſtrive to match them euery way. For as touching the Statane vineyards, that confine and border vpon the Falerne, their wines doubtleſſe are now come to be the principall and chiefe of all the reſt: whereby it is evidently ſeen, that euery territory and vine-plot hath their times and ſeaſons, like as all other things in the world, one while riſe and another while fall. For in times paſt the Calene wines made of the grapes growing hard by Rome, were wont to go before all others: as alſo the Fungane vines had their time, as well thoſe that are planted in vineyards, as they which runne vpon trees: like as thoſe of the other ſide, neere alſo to the city of Rome, & namely from Veliternum and Priuernum. For as touching the wine of Signia, it is held for a medicine only; and by reaſon of an aſtringent verdure that it hath, it is excellent good to ſtay the flux of the belly. In the fourth place of this race of vines, *Julius Caſar* (late Emperor of famous memory) hath raunged, (for to ſerue the publick and ſolemne feaſts of the city) the Mamertine wines, from about Meſſana in Sicily: for he was the firſt (as appears by his letters miſſiue) that gaue credit and authority vnto them. And of thoſe, the Potulane wines (ſo called of them who firſt planted the vines whereof they came) are moſt commended, and namely thoſe that are vpon the next coaſt of Italy. Within the ſame Sicily, the Taurominitane vines are highly eſteemed, inſomuch, as many times they go for Meſſana wine, and are ſo ſold by whole potles. Now for all other wines from about the coaſt of the Tuſcane ſea Northward, good reckoning is made of the Prætutian and ſuch as come from Ancone: alſo of the Palmefian wines, which haply tooke that name, for that the firſt plant of that vine came from a palme or Date tree. But in the midland parts of Italie within the firme land, good regard there is of the Ceſenatian and Mecænian wines. Within the territory of Verona, the Rhetian wine carrieth the price: which *Virgil* ranged next after the Falerne wines. Anon you come to the wines Adriane, and thoſe that grow far within the tract of the Venice gulfe. Now from the nether ſea about Lions, ye haue the Latinienſian, the Grauiſcane, and the Statonian wines. Throughout all Tuſcane, the wines about Luna beare the name: like as thoſe of Genes, for Liguria. Betweene the Pyrenean hills and the Alpes, Maſſiles hath the commendation for wines of a double taſt: for the vines there, do yeeld a certain thick and groſſe wine, which they call Succoſum, [i. full of iuice and liquor] good to ſeaſon other wines, and to giue them a prety taſt. When ye are paſſed once into France or Gaule, the wine of Beterre is in chiefe requeſt. As for the reſt within Languedoc and the Prouince of Narbon, I am not able to auouch any thing for certainty, ſuch a brewing and ſophiſtication of them they make, what with ſuming, perfuming, and colouring them: and would God they put not in ſome herbes and drugs among, that be not good for mans body. For certaine it is that they commonly buy Aloe to giue the wine both another taſt and alſo a counterfeit color. Moreover in the farther and more remote coaſts of Italy toward the Auſonian ſea, there be wines which are not without their praiſe and commendation, and namely thoſe of Tarentum, Seruitium, and Conſentia: likewiſe of Tempſa, Bauia, and Lucania: howbeit the Thurine wine goeth before

G

I

K

L

M

for

A for them all. As for the wines of Lagaria, which be made of the grapes not farre from Grimenitum, there goes a right great name of them, by reaſon that *Meſſala* vſed ordinarily to drinke thereof, and thereby was ſuppoſed to preferue his health ſo well. Of late daies there be certain wines in Campaine growne into credit (like as they haue gotten new names) by good ordering and husbandrie, or by chance, I know not whether; namely, thoſe of Tribellia, foure miles from Naples, of Caulium neare to Capua: and laſt of all, the Trebulaine wines within their own territory: for before time they were euer counted no better than common wines for euery man to drinke, no more than the Trifolines, from whence they vaunt of their deſcent. As for the wine of Pompeij, a towne in the kingdome of Naples, neither it nor the vine whereof it commeth, will laſt about ten yerres at the moſt: after which tearme, the elder they both be, the worſe they are. Beſides, they are found by experience to cauſe the head-ach, inſomuch, as if a man drinke thereof ouer-night, he ſhall be ſure not to haue his head in good time vntill noone the morrow after. By which examples aboue rehearſed, it is plaine in my conceit, that the goodneſſe of the wine ſtandeth much vpon the ſoile and the climate, and not in the grape: ſo as a needleſſe and endleſſe matter it is to reduce all kind of wines to a certaine number, conſidering that one and the ſelfe ſame Vine planted in diuerſe places, hath ſundrie operations, and maketh varietie of wines. Now as concerning the wines of Spaine, the Lakatane vineyards are much ſpoken of for the plenty and abundance of wine that they yeeld: but thoſe of Tarracon, Arragon, and Laurone, are much praiſed and renowned for the fine and neat wines which they make. As for the wines that come out of the Iſlands, and namely, the Balears, they are comparable to the very beſt in Italie.

C

I am not ignorant, that moſt men who ſhall read this Treatiſe, will thinke that I haue omitted and ouerpaſſed many wines: for euery man likes his own, and as ones fancie leadeth, ſo goes the voice and the cry, and there runs the Hare away. It is reported, that one of *Augustus Caſars* freed men (reputed for the fineſt taſter that he had about his court, and who knew beſt what would content his palat, and pleaſe his tooth) vpon a time when he taſted the wine that was for the Emperors board, at what time as he made a feaſt, ſaid to one of the gueſts at the table, That the ſaid new wine indeed had a new and ſtrange taſt, and was none of the beſt, and thoſe that were innathe, howbeit (quoth he) this is for the Emperors cup, and willingly will he drinke of no other, notwithstanding it be but a homely wine made hereby in the country, and not far ſerched. And now for a ſmall concluſion of this matter, I cannot denie but that there be other wines which deſerue to be numbred among thoſe that are right good and commendable; howbeit, ſuffice it ſhall to haue written of theſe, which by the common opinion and conſent of the world are held for the better.

CHAP. VII.

Of Wines beyond ſea.

IT remaineth now to ſpeake of outlandiſh Wines beyond the ſea. Firſt and formoſt therefore next to thoſe wines renowned by the Poet *Homer*, and whereof we haue written before, beſt eſteemed alwaies were the wines of the Iſlands Thafos and Chios: and namely that of Chios which they call Aruium or Aruiſium. *Eraſſtratus* the moſt famous Phyſician of his time, matched with theſe the Lesbian wine; and his authoritie gaue credite vnto it: and this was much about the ſix hundred yeare after the foundation of Rome. But in theſe daies there is now iſe to that of Clazomene, euer ſince that they began to put therto leſſe ſea-water for to ſeaſon it, than their cuſtome was. As for the wine of Lesbos, it hath a ſent and relliſh of the ſalt water naturally of it ſelfe. Neither is the wine that comes from the hil Tmolus in any regard, as a wine to be drunke alone, but it ſerues as a ſweet cuit to mingle with other wines that be hard: for thereby their Greene verdure will ſeeme more mild and pleaſant, yea, and withall to haue their ripe age: for no ſooner is it tempered therewith, but they taſt preſently elder than they be. Next to theſe in goodnes, follow in their courſe the wines of Sycione, Cypres, Telmeſſus, Tripolis, Berytus, Tyrus, and Sebennys. As for this wine laſt rehearſed, it is made in Egypt, a country much renowned for three kinds of grapes there, to wit, Thafia, Ethalos, and Peuce. Next in price & account be theſe following, the Hippodomantian, the Myſtick, Cantharite, & the Gnidian wine of the firſt running and vnpreſſed, alſo that of Caraccaumene, a region ſo called, for that it ſeemeth

meth

meith all burnt; of Petra, and Mycones. As for the wine Mefogarus, it is knowe to make head-ach: neither is the wine of Ephesus wholesome and healthfull, because it is sophisticated with a kind of cuithall fadden, called Desfrutum, and sea-water. As for the wine of Apamea, by report it comes very neare to a kind of Mede, and will very well agree withall, like as Pratutium in Italy. For otherwise, this is the property in generall of all sweet wines, that they will not well fort together, & be good still. Touching the wine Protagium, it is now grown out of remembrance: and yet the Physicians of Asclepiades his sect and schoole, gaue praise vnto it next the Italian wines. The learned Physician Apollodorus, in his treatise that he compiled of good wines, which he recommended vnto King Ptolemaeus for to drinke, as meet for the health of his person, (for default of Italian wines then vnknew) highly praised the wines in Pontus, & principally that which is called Naspercenites next to it the Oræotik; the Oeneates, that of Leucadia, of Ambracia; and (which he prefereth aboue all the rest) the wine of Peparethus: and yet he said, that there went the lesse name and opinion of it, because after sixe yeares it loseth the strength and pleasant tast that it had.

CHAP. VIII.

¶ Seven kinds of salt wine.

Thus far forth haue we discoursed of the very floure of good wines, according to the regions where naturally they come of the grape. Now are we to treat of wines compounded. And first, among such wines is that, which they call Biazon (an inuention of the Greeks) which aboue all others is most esteemed, and great reason, for deuised it was for the cure of many maladies, as we shall shew hereafter in our treatise of Physick. The making wherof is in this manner: Take grapes gathered somewhat before they be ripe: let them lie to drie and parch in the hot Sunne for three daies, and be turned duly thrice a day: vpon the fourth day presse them forth for wine, put the liquor vp in barrels, and so let it worke in the Sun. Howbeit, hereto they put a good quantity of salt sea-water. But this deuise was learn'd first of a false theeuish knaue who hauing robbed his maister and drunk vp a good deale of his wine, filled vp the vessel again and made just measure with sea-water. Whiter wine if it be ordered in this sort, is called Leucochrum by the Greeks: but in other nations, the like wine so made is named Tethalassomenon. As for Thalassites, it is a kind of wine so called, for that the vessels, when the wine is new tunned, be cast into the sea, and there let to remaine for a time, by which means the wine will soon seeme old and readie to be drunke. Furthermore, we also here among vs hath shewed the way how to make the Greekeish Wine Coum, of our owne Italian Wine: but aboue all he hath set down an expresse rule, to let it first take the maturitie and perfection 4 yeres in the Sun. As for the wine of Rhodes, it is much like to that of Coos, But the Phorinean wine is more salt than the wine of the Isle Coos. Finally, all transmarine or beyond-sea wines are thought in seuen or six yeares at the least, to come vnto their middle age.

CHAP. IX.

¶ Fourteen sorts of sweet wines.

Alwaies the sweeter that they be in tast, the lesse fragrant & odoriferous they be: the thinner and smaller that they be, the more euer they smell to the nose. Of wines there be four principall colours, white, yellow, red, and blacke. As for Psythium and Melampsythium, they be certaine kinds of quins, hauing a generall tast apart by themselves, not resembling wine indeed. And for Cicibelites made in Galatia, it tastes alwaies like new wine: so doth Halantium in Sicily. For as touching Syraem, which some call Hepsema, & we in Latine Sapa, [i. Cuit] it is a meer artificiall thing, the deuise of mans wit, and no worke of Nature: namely, when new wine is foddren away a third part: for when it boiles to the halfe, we then call it Desfrutum. And in very deed, all these be inuentions to sophisticate and counterfeit honie. But those before named retain the naturall tast of the grape and the soyle whereof they doe consist. Next to these cuit-wines of Candie, those of Cilicia, Affrick, Italy, and the prouinces confronting therupon, are held for the best. Certain, it is, That they be made of one grape, which the Greekes call Strica, and we Apiana, [i. the Muscadell] and of another named Scirpula: the which haue been suffered

fered a long time to hang in the Sunne vpon the Vine vntill they be scorched and parched: or else ouer the vapor of scalding oile. Some there be that make them of any sweet grapes whatsoeuer, so that they be let to concoct before in the Sun, vntill they be white and drie, so farre forth, as little lesse than half of their weight be consumed: which done, they stamp them and so gently presse them. Then looke how much liquor they haue pressed forth, so much pit water they put to the cake that is pressed; that thereof they may haue a cuit of a second running. But they that be more curious & take vpon them to make a daintier cuit, dry the grapes in maner aforesaid; but they take forth the stones and graines within: they strip them also from the steeles and railes that they hung by, and so after they be well drenched and infused in some excellent wine vntill they be swelled and plumpe, they presse them. And certainly this fashion is simply the best of all others. Put to the cake thereof, water as before, and after the same manner yee shall haue a cuit of a second sort. Now there is a kind of wine which the Greeks call Aigleuces, that is to say, alwaies sweet like new wine, of a middle nature between the common simple wine and the sweet: and this commeth not vnto it by kind, but by heed taken in the boiling; for it is not suffered to seeth and work: and this is the term, whereby is signified the alteration of new Must into wine. To hinder therefore that it work not, (as naturally it will) they haue no sooner tunned or filled it out of the Vat, but immediatly they dousse the vessels full of new Must in the water, and let them there continue till mid-December be past, and that the weather be settled to frost and cold, and likewise the time expired of the working within the said vessels. Moreouer, there is another kind of wine naturally sweet, which in Prouance and Langue doc is called Dulce [i. sweet] & namely, in the territorie of the Vocontians. For this purpose they let the grapes hang a long while vpon the Vine, but first they wryth the Steele that the bunch hangs to. Some make incision into the very Vine branch, as far as to the pith and marrow within (to diuert the moisture that feeds the grape); others lay the clusters a drying vpon tile-houses: and all this is done with the grapes of the Vine Heluenaca. There be that range in a ranke of these sweet wines, that which they call Diacyton. For which effect, they drie the grapes against the Sun (howbeit in a place well enclosed) for 7 daies together, vpon hardles, 7 foot likewise from the ground: in the night season they saue them from all dewes, and so on the eighth day they tread them in the wine presse: and thus they draw forth a wine of an excellent sauer and tast both. A kind of these sweet wines, is that which they name Melitites, [in manner of a Brager, Meade, or Metheglin.] Howbeit, different it is from the mead or honied wine which the Latines call Mulsium, made of old wine that is hard, and a little honie: whereas the foresaid Melitites consists of 5 gallons of new tart wine still in the verdure, whereto is added one gallon of honie, and a * cyath of salt, and so boiled all together. But I must not forget to place among these sundry kinds of drinke, the liquor Protropum, for so some call new wine running it self from the grapes, before they be troden and pressed. But to haue this good, and so to serue the turne, so soon as it is put vp into proper vessels for the purpose, it must be suffered to work: and afterwards to reboile and work againe for fortie daies space the Summer following, euen from the very beginning of the dog daies, and so forwards

CHAP. X.

¶ Of weak and second Wines, three kinds.

The second wines, which the Greeks call Deuteria, Cato and we Romans name Lora) cannot properly and truly be called Wines, being made of the skins and seeds of grapes steeped in water: howbeit, reckoned they are among course household wines for the hines and meinie to drinke. And three kinds there be of them. For sometime to the tenth part of the new wine that hath bene pressed out, they put the like quantity of water, and suffer the foresaid residue of the grapes to soke therein a day and a night: which done, they presse it forth againe. A second sort there is, which the Greeks were wont to make in this manner: They take a third part of water in proportion of the wine that was pressed forth, and after a second pressing, they seeth it to the waisting of the third part. The third is that which is pressed out of the wine lees, and this Cato calls Phœcatum, [i. Vine of lees.] But none of these wines or drinks will endure aboue one yeare.

CHAP.

CHAP. XI.

¶ *What neat wines began of late to be in request in Italie.*

IN this treatise of wines I cannot omit this obseruation: That whereas all the good wines properly so called and known in the whole world, may be reduced in four score kinds or thereabouts, two parts of three in this number, may well be counted wines of Italie: which in this regard farre surpasseth all other nations. And hereupon ariseth another thing more deeply to be noted, That these good wines were not so ripe nor in such credit from the beginning, as now they be.

CHAP. XII.

¶ *Observations touching wine.*

TO say a truth, Wines began to grow in reputation at Rome, about fixe hundred yeares after the foundation thereof, and not before. For king *Romulus* vsed milk when he sacrificed to the gods, and not wine: as may appear by the cerimonial constitutions by him ordained, as touching religion; which euen at this day be in force, and are obserued. And king *Numa* his successor made this law *Posthumia* in his later daies, *Let no man besprinkle the funerall fire with wine.* Which edict no man doubteth, but he published and enacted in regard of the great want and scarcitie of wine in those daies. Also by the same Act he expressly did prohibite to offer in sacrifice to the gods, any wine comming of a Vine-plant that had not bene cut and pruned: intending by this deuise and pretence of religion, to enforce men to prune their Vines, who otherwise would set their minds on husbandrie only and plowing ground for corne, and be slow enough in hazarding themselves for to climbe trees, whereunto Vines were planted. *M. Varro* writeth, That *Alcegius* the king of Tuscane aided the *Rutilians* of Ardea in their warres against the Latines, for no other hire and wage but the wine and the vines which then were in the territorie of Latium.

CHAP. XIII.

¶ *Of the ancient vsage of wine: and the wines in old time.*

IN ancient time, women at Rome were not permitted to drink any wine. We read moreover in the Chronicles, That *Egnatius Maccennius* killed his owne wife with a cudgell, for that hee tooke her drinking wine out of a tun; and yet he was cleared by *Romulus*, and acquit of the murder. *Fabius Pictor* in his *Annales* reports, That a certaine Romane dame, a woman of good worship, was by her owne kinsfolke famished and pined to death, for opening a cupbord, wherein the keis of the wine-sellar lay. And *Cato* doth record, that hereupon arose the manner and custome, That kinsfolke should kisse women when they met them, to know by their breath whether they smelled of Temetum: for so they vsed in those daies to tearme Wine: and thereof drunkenesse was called in Latine Temulentia. *Cn. Domitius* (a iudge in Rome) in the like case pronounced sentence judicially against a woman defendant, in this forme, *That it seemed she had drunke more wine without her husbands knowledge, than was needfull for the preservation of her health,* and therefore afterward definitiue, *That she should lose the benefit of her dowrie.* Certes, the Romanes for a long time made great spare of wine. *L. Papyrius* lord Generall of the Romane armie, when he was at the point to joyne battell with the Samnites, made no other vow, but this, *That he would offer vnto Iupiter a little cup or goblet of wine, in case he atchieued the victorie and wooon the field.*ouer and besides, we find in histories, that among donatiues and presents, certaine sextars or quarts of milke haue bene many times giuen, but neuer any of wine. The same *Cato* abouenamed, after his voiage into Spain (from whence he returned with a notable victorie, and in a triumphant manner) in a solemne speech that hee made vnto the people, protested in these words and said, *No other wine I haue drunke since I went, than the very mariners haue.* How farre vnlike was he to men in these daies, who sitting at the table, haue their cup of strong wine by themselves, and giue vnto their guests, for the most part, other small wines to drinke: or if they suffer them to drinke all one and of the best at the beginning of the feast, they will

A will be sure to change and to serue them with worse soon after. In old time, the best wines vsed at feasts were aromatised and spiced with sweet Myrrh, as appears in the Comedie of *Plautus*, entituled *Perfa*. And yet it should seeme there, that sweet Calamus was to be added besides. And hereupon it commeth, that some haue thought, how our forefathers in times past tooke most delight in such spiced cups and Ippocras wines. But *Fabius Dorsetus* the Poet sufficiently declareth and decideth this point in these verses, when he saith,

Mittebam vinum pulchrum, Murrhinum.

I sent neat wine,
Which hight Myrrhine.

B And againe in his Comedie *Acharistio*:

Panem & Polentam, vinum Murrhinam.

Both bread and grewell I did present,
And Myrrhine wine of pleasant sent.

I see moreover, that *Scavola*, *Lalius*, and *Atteius Capito* were of the same mind. For in the Comedie of *Plautus* entituled *Pseudolus*, thus it is written:

*Quod si opus est ut dulce promat
Indidem, ecquid habet? (Char.) Rogas?
Murrhinam, passum, Defrutum, mella.*

Of dulcet wine if there be need,
What hope is there from thence to speed?
Char. Why aske you that? he furnish'd is
With Murrhin, Cuits, and Meade ywis.

By which a man may see evidently, that Murrhina was not onely counted a wine, but reckoned also among the sweet and delicate wines.

CHAP. XIII.

¶ *Of wine store-houses: and of Opimian wine.*

That there were wine sellars at Rome, and that they vsed there to tun vp Wine in the 633 yeare after the foundation thereof, appeareth plaine by a good prooffe of the Opimian wine: and euen in those daies Italy knew her owne good, and what it was to maintaine vineyards. Howbeit, as yet were not those wines in credit, which now are so ripe and in so great account. And therefore it is, that all the wines of that time bear the only name of that one Consul, and be called Opimian. And thus afterwards also in proceffe of time, the wines that came from beyond the seas for a long space, were in much request, euen vntil our grandfathers daies: yea, and after that, the Falern wines were in name and called for, as may appear by that Verse of the Comical Poet;

Quinque Thasi vini inde depromam, Falerni bina.

To measures fise of Thasian wine,
I will draw twain of Falerne fise.

In the 675 yeare after the foundation of Rome, *Pub. Licinius Crassus*, and *L. Iulius Caesar*, Censors for the time being, published an Edict, and proclaimed, *That no man should sell any Greek wine, or Aminean, but after eight Asles the Amphor or Quadrantum.* For these be the verie expresse words of the said Edict. Now was Greeke Wine of so great price and estimation, that a man was but allowed one draught thereof at a meale, were the cheare neuer so great, and the feast right sumptuous. But what wines were in request ordinarily at the board, *M. Varro* doth shew in these words: *L. Lucullus* (quoth hee) while he was a boy, neuer saw at his fathers bord

Greeke

Greekewine serued vp but once at a meale, how good foeuer the fare was otherwise. Howbeit, G himselfe when he returned out of Asia, in a congiarie or largesse that he gaue vnto the people, made a dole and distribution of more than an hundred thousand measures of gallons apiece. C. *Sentius*, whom of late daies we saw Pretor of Rome, testified, that he neuer saw any wine of Chios brought into his house, before the Physition prescribed and set it down for the *Cardiaca passio*, or the trembling of the heart, whereto he was subiect. But contrariwise *Hortensius* when hee died left about ten thousand barrels full of that Wine vnto his heire. And thus much out of *M. Varro*.

CHAP. XV.

¶ Of *Cæsars* bountie and liberalitie in Wine.

B Vt what should we say of *C. Iulius Cæsar* Dictator? In that solemne feast of his which hee made at his triumph, did not he distribute among his guests Falerne wines by whole barrels, and Greek wine of Chios by the rundlets? After his returne out of Spain with victorie and triumph, he likewise gaue away a largesse of wine as well Chian as Falern. But at the royall dinner which he made when he entred vpon his third Consulship, he caused all the Hall to be serued thorowout with Falern, Chian, Lesbian, and Mamertine wines: which was the first time that euer any man saw the seruice of 4 feuerall wines at one feast. Now in farther proces of time, and namely about 700 yeares after Rome cities foundation, all other Wines began to beare a name and come in request.

CHAP. XVI.

¶ Of Artificiall or made Wines.

C Onsidering all that hath bin written, I nothing maruel at such an infinite number of compound and artificiall wines deuised in old time, all for the vse of Physick, wherof we will now treat in more ample maner. To begin therefore with wine-Verjuice, called *Omphacium*, how it should be made, for perfumes and odoriferous ointments, we haue shewed in the former booke. As for the wine named *Oenanthinum*, it is made of *Labrusca*, that is to say, the wild Vine, in this wise: Take two pound of the floures of the wild vine aforesaid, let the same be steeped in a measure of new wine containing about 12 * gallons, for the space of 30 dayes, and then be changed out of that vessell into another. Moreover, the root and grapes of the sayd wild Vine are good for curriers to dresse their leather. The same grapes a little after they haue done blooming are taken to be a singular remedie for to coole those that be troubled with hot and ardent diseases, for naturally they be, as men thinke, exceeding cold: and indeed many of these grapes die in the hot time of Summer before the rest which are called *Solstitiales*: but all of them neuer come to full and perfect ripenesse. Now if you would keep *Pullein* from pecking grapes, take these of the wild Vine before they be throughly ripe, mingle and seeth them with their meat: for this will take away all their appetite that way, and breed a loathing after all grapes.

To come now vnto the artificiall wines before named: the first of them, namely that which they call *Adynamon* [i. without strength] is made of very wine in this sort: Take of new white wine 20 Sextars [i. quarts:] of water halfe as much: let them boile together vntill the measure of water before said be consumed. Some take of sea water ten Sextares, of raine water as much: and when they be mingled together, suffer them to worke in the hot Sun for the space of fortie daies. This drinke they vse to giue vnto patients, for such maladies as they feare wine would be hurtfull to. A second made wine there is called *Miller Wine*, after this sort: Take of *Miller* seed that is ripe, huske, head, and all, a pound and a quarter, put it into two gallons of Must, or new wine: after that it hath lien there infused seuen moneths, let the liquor run from it into another vessell, and keepe it for your vse. As touching the wines of *Lotus*, as well the tree and shrub, as the herbe, we haue shewed sufficiently how they ought to be made. Moreover, there be many wines made of sundry fruits, which we will write of hereafter more at large: with a supplement and addition of such interpretations only as be necessarie. And in the first place commeth the date wine, which the *Parthians*, *Indians*, and all the Nations of the East in general

A nerall do ordinarily vse. A *Modius* or pecke of ripe and sweet dates, which they call *Chideæ*, they let lie to steep in 3 gallons of water, and so presse for a liquor for the Date wine. Also the Fig-wine *Sycites*, of the fig which some call *Palmiprium* (as a man would say, Dates fellows, or next to Dates) others *Catorchites*, is made after the same fashion. But if a man list not to haue it so sweet, in stead of water they vse to put so much of the stones, skins, & seeds of grapes. Of the Fig of Cyprus there is an excellent Vinegre made, yea and a better than it of the *Alexandrine* Figs, to wit, growing vpon the *Sycamore*. Likewise a wine is made of the fruit in Syria called *Silique*; as also of peares and all kind of apples. As for the wine of *Pomegranates*, the Greeks name it *Rhoites*: besides the fruit of the *Corneil* or wild Cherry tree, *Medlars*, *Seruices*, dry *Mulberries*, and *Pine-nuts*, doe yeeld feuerall sorts of wine. As for those pine nuts, they must lie steeped in new wines, before the wine be pressed out of them. The rest all be pleasant enough of themselves, and will serue alone for to make wines. The maner of making *Myrtle* wine, according to the receipt and prescription of *Cato*, we will declare soon hereafter. For the Greeks haue another way of their owne, to wit, when they haue sodden in white Must or new wine the tender branches of the *Myrtle*, together with the leaues, and then stamped the same, they put a pound thereof in three gallons more of Must, and cause it to boile vntill such time as a third part of the wine be consumed. Now that which is made after the same maner of the wild *Myrtle* berries, they call *Myrtidanum*; and this will colour and staine ones hands blacke.

Furthermore, the herbs of the garden do afford vs many wines, namely *Radish*, *Sperage*, *Savory*, & *Majoran*, *Origan*, *Smallach* seed, *Southernwood*, wild *Mints*, *Rue*, *Nep*, or *Calamint*, running *Thyme*, or *Horehound*. To make these wines, take of the herbs abovesaid two handfulls, and when they be stamped, put them into a little barrell of new Wine containing twelue or thirteene gallons, together with a wine quart of Cuit sodden to the thirds, and a pint of seawater. But for the wine of *Navews*, you must take eleuen drams of them, and two quarts of new wine, and so put them together in maner aforesaid. In like sort also the wine *Squilliticum* is made of the root of *Scilla*, or the sea Onion.

To proceed vnto wine made of floures, you haue first and formost wine *Rosat*, after this maner: Take the weight of 40 deniers [i. six ounces] of Rose leaues well stamped, put them into a linnen cloth, together with a little weight, that they may settle downward, & not flote aloft; let them hang thus in 20 Sextars [i. three gallons] and two wine quarts of Must; keep the vessel close stopp'd in any case for 3 moneths, then open it and strain the said floures vnto the liquor. In like maner is there a wine made of the Celtick *Spikenard*, as also of the *Nard* sauage. I find also, that they vse to make a kind of spiced wine or *Ipocras*, not for sweet perfumes and ointments only, but also for to drinke. At first (as I haue shewed) they made these aromaticall wines with myrrh only, but soone after they added thereto *Nard* Celtricke, sweet *Calamus*, and *Aspalathus*, either slicing these drugs, or putting them by gobbets into new Must or some dulcet wine. Some aromatise their wine with *Calamus*, *Squinanth*, *Costus*, *Spikenard*, *Amomum*, *Casia*, *Cinamon*, *Saffron*, *Dates*, and *Azara-bacca*, put therto in like maner by gobbets. Others take *Spikenard* and *Malabathrum*, of each halfe a pound to two gallons of new wine. Much after the same maner we spice our wines now adaies also, but that we adde pepper and hony thereto: which some call *Condite*, others *Pepper* wines. Moreover, there is denised a Wine called *Nectarites*, made of *Elecampane*, named by some *Helenium*, of others *Medica*, *Symphiton*, *Idaea*, *Orestion*: and there be also that term this herb *Nectaræa*. Now the order of it is to take of the root forty drams, to six Sextars of Must or new wine, and hang it in a cloth together with a weight in maner aboue said. Moreover, there be wines made of other herbs, to wit, of wormwood, in this sort: Take of *Ponticke* Wormwood one pound, seeth it in forty Sextars [about six gallons and a halfe] of new Wine, vntill a third part be consumed: or without boiling, put certain handfulls or bunches thereof into a vessell of Wine, and so let it lie infused. After the same sort is *Hyssop* wine made, to wit of three ounces (which is a quarter of a pound) of *Cilician* *Hyssop* cast whole as it is into two gallons of Must, and so let them worke together: or else stampe the *Hyssop*, and so put it into wine. But both these wines are made another maner of way, namely by sowing or setting wormwood & *Hyssop* at the very root of the Vine-plant: for so *Cato* teacheth vs to make *Ellebowe* wine, of blacke *Ellebowe* or Beare-foot growing at the Vine root. And in like maner also is made the *Scammonite* wine. A wonderfull nature and

propertie these vines haue, to draw and sucke into them the very taste of other herbs and plants that are set neere vnto them: for euen so all the grapes about Padua haue a rellish of the Willows and Others that grow there in the marish grounds. Thus the men of Thafos do plant and sowe either Ellebore, or wild Cucumbe, or els Scammonia, about their Vines, to make thereof their diuelliſh wine Pthorium, so called, because it causes a sleep, and procures vntimely birth. Of more herbs besides there be other wines made, the vertues of which herbs we wil set downe elsewhere in place conuenient: and namely of Stoechos, the root of Gentian, of Tragoriganum, of Dictamnus, of Arabacca, of Daucus, or yellow Carot, Sauge, Panace, Acorus, or Galan- gal, Conyza, or Cunilago, Thyme, Mandragoras, and Squinanth. More such wines were yet, which the Greeks called Scyzinum, Itæmelis, and Lectisapagites; but as they be growne now out of vse, so the manner of making is vnknown.

As touching wines made of trees & shrubs, their maner was to seeth the berries of the green wood of both the Cedars, the Cypres, the Bay, Iuniper, Terebinth, Pine, Calamus, and Lentisk, in new wine. In like maner, the very substance of Chamelæa, Chamæpithys, and Germander. Last of all, the floures also of the said plants serue to make wines, namely, by putting into a gal- lon of new wine in the vat, the weight of ten deniers or drams of the floures.

CHAP. XVII.

¶ Of Hydromel and Oxymel, [i. Honied water, and Honied vineger.]

There is a wine called Hydromel, made of water and hony onely: but to haue it the better, some do prescribe rain water, and the same kept fve yeares for that purpose. Others who are more wise and skilfull herein, do take raine water newly fallen, and presently seethe it vntill a third part be boiled away: then they put therto a third part also of old hony in propor- tion to it: and so let them stand together in the Sun for forty daies together, from the rising of the Dog- star. Others, after they haue remained thus mingled and incorporate together ten daies, put it vp & reserue it close stopp'd, for their vse; and this is called Hydromel, which be- ing come to some age hath the very tast of wine, & no place affords better than Phrygia.

Moreover, Vineger was wont to be tempered with hony, [See how curious men haue bin to try conclusions in euery thing!] which they called Oxymel; and that in this manner: *Recipe*, of hony ten pounds or pints: of old vineger fve pints; of sea salt one pound; of rain water fve Sextares [i. a gallon within one quart:] boile them al together at a soft fire, vntil they haue had ten plawes or walmes: which done, poure them out of one vessell into another, and so let the li- quor stand and settle a long time vntil it be stale. All these wines & compositions thus brued, *Themison* (an Author highly renowned) hath condemned and forbidden expressely to be vsed. And to say a very truth, it seems that the vse of them was neuer but in case of necessity: vnlesse a man would beleue and say, that Ipcras, spiced wines, & those that be compounded of oint- ments, are Natures work; or that she brought forth plants and trees to no other end, but that men should drink them down the throat. Howbeit, the knowledge surely of such experiments be pleasant and delectable vnto men of great wit and high conceit, whose noble spirits cannot be at rest, but euer inuentiue and searching into all secrets. Now to conclude this point, certain it is and past all question, that none of all these compositions, vnles it be those which come to their perfection by age and long time, will last one yeare full out, nay most of them will not keep good one moneth to an end.

CHAP. XVIII.

¶ Certaine strange and wonderfull sorts of wine.

Wine also hath prodigious and miraculous effects: for, by report, in Arabia there is a wine made, which being drunk will cause barren women to beare children; and con- trariwise driue men into madnes. But in Achaia principally about Carynia, the wine makes women fall into vntimely trauell: nay if a woman great with childe do eat but the verie grapes, they will slip the fruit of their wombe before their time: and yet both grape and wine differ not in tast from others. They that drinke the wine comming from the cape Tæzen, ate thought vnable for generation. It is reported, that the Thasiens do make two kinds of wine of contrarie

A contrarie operations; the one procures sleep, the other causeth watching. Among them there is a vine called Theriace, the grape whereof, as also the wine, cureth the stings and biting of ser- pents, as it were a most especiall Treacle. As for the vine Libanios, it carrieth the odour and smell of Frankincense, and therefore is vsed in sacrifices to the gods. But contrariwise another named Apendios is vtterly condemned for that purpose, and no wine thereof is imployed at the altar: they say also that no fowle will touch the grapes thereof. There is a kind of grape in Egypt which they call Thasia, exceeding sweet it is, and looseth the belly. But contrariwise there be in Lycia that binde as much and cause costiueneſſe. The grapes Ecbolides in Egypt if they be eaten, cause women with child to be deliuered before their time. Some wines there be that as they lie in the very cellar will turn and proue soure about the rising of the Dog- star; but afterward wil recouer their verdure and become quick and fresh again. In like maner there be wines which vpon the sea will change: howbeit the agitation thereof causeth those Wines which endure it to the end to seem twice as old as they be indeed.

CHAP. XIX.

¶ What Wines they be that may not be vsed in sacrifices: and what waies there are to sophisticate new wines.

Forasmuch as our life stands much vpon religion and diuine seruice, wee are to vnderstand, That it is held vnlawfull to offer vnto the gods before sacrifice, the Wine of any vine that hath not bin cut and pruned; or that hath bin smitten or blasted with lightening, or stan- ding neere to a jebbit or tree whereon a man hath hanged dead; or the grapes whereof haue bin troden by men whose legs or feet haue been wounded; neither is that wine allowable for this purpose, which hath bin pressed and run from the refuse of grape stones and skins once bruised and crushed in the presse; or last of all, if the grapes haue bin filed by any ordure or dung fal- len from about thereupon. Moreover, Greeke Wines are reiected from this holy vse because they haue water in them. Furthermore, the vine it self is holden good to be eaten, namely, when the burgens and tendrils be first sodden, and afterwards preserued and kept in vineger, brine, or pickle.ouer and besides, it were very meet and conuenient to speake also concerning the man- ner of preparing and ordering of wine, seeing that the Greeks haue trauailed in that point seue- rally, and reduced the rules belonging therto, into the form of an Art; and namely, *Euphronius*, *Aristomachus*, *Coniades*, & *Hicesius*, are therein great professors. The Africans vse to mitigate and allay the tartneſſe of their wines with plaſtre, yea and in some parts of their country with lime. The Greeks contrariwise do fortifie and quicken them with clay, with powder of marble, with salt or sea water: and in some places of Italy they vse to the same effect, the shauings and sca- rings of stone-pitch. Also it is an ordinary thing in Italy and the prouinces thereto conſining, for to condite their new wines & to season them with roſin: yea and in some places they min- gle therewith the lees of other old wine or vinegre. Oftentimes also they make sliber-sauces of it selfe without any other mixture; namely, when they boile new wine sufficiently to the pro- portion of the strength, vntill the hardneſſe do euaporate, and that it wax mild and sweet: but being thus ordered, it will not last, they say, about one yere. In some countries they vse to seeth their new wine to the consumption of a third part, and make it Cuit, with which they are wont to delay the sharpnes and strength of other wines, & make them pleasant. But both in this kind of wine and in all other, the vessels ought to be prepared for the purpose, & seasoned with pitch: the treatise of which we will put off vnto the next booke, where we purpose to treat thereof, and the manner of making it.

CHAP. XX.

¶ Of diuers kinds of Pitch and Rosins: the manner of the seasoning and conſecture of new Wines. Also of Vineger and salt.

Among trees that yeeld from them a liquid substance, some there be in the East countries, and others in Europ, which ingender Pitch and Rosin. Asia likewise between both, hath of either side it some such trees. As for the East, the Terebinths put out Turpentine, the best and cleereſt Rosin of all others: next to them, the Lentiskes also haue their Rosin, which

they call Mastick. After which, the Cipres brings forth a third rosin, but it is of a most sharpe and biting taste. All these trees (I say) carry rosin only, and the same thin and liquid; but the Cedar sendeth forth a thick substance, and good to make pitch & tar. As for the rosin or gum Arabick, it is white in colour, strong of smell, vntoward and troublefom to him that shall boile it. That of Iury is harder, yea, and of a stronger sauer than Turpentine. The Siriack gum resembleth the hony of Athens. The Cyprian excelleth all others: of a fleshy substance it is, & like in colour to hony. The Colophonian is deeper of colour, and reddish: beat it to powder in a mortar it proueth white: but it carieth a strong smel with it, which is the reason that the perfumers and makers of ointments haue no vse thereof. As for that which the pitch trees of Asia do yeeld, it is passing white, and the Greeks call it Spagas. All rosins generally will dissolve in oile. Some think verily, that Potters clay will likewise do the same. But I am abashed & ashamed to report, how in these daies the same pitch whereof we speake, should be in so great account as it is, for making of pitch plaisters, to fetch off the haire of mens bodies, & all to make them more smooth and effeminate. Howbeit, the maner of seasoning new Must therewith (that when it is perfect wine, it may smell of pitch, and bite at the tongues end) is to bestrew it with the powder of pitch at the first working, the heate whereof is commonly past and gone in nine daies. And some think that the wine will be the stronger, if the raw and green floure of the Rosin, as it issueth fresh out of the tree, be put therein, for it will quicken a small and weak wine. Now this mixture and medicine of wine [called Crapula] made thus of rosin, hath contrary effects: for if the wine be ouer-heady and strong, it allaieth & mortifieth the hurtful force thereof: but if it be too weak, or drink dead & flat, it reuiueth againe, and giueth it a strong taste. In Liguria, and principally along the Po, they vse to season their wines, and bring them al to their feuerall perfections in this maner. If the wine when it is new be mighty and strong, they put in the more of this medicine or confection called Crapula: if it be mild and small, then the lesse goes into it: and keeping this gage with their hand, they make both good. Some would haue one wine brued with another, the weaker with the stronger, and so (forsooth) there must needs arise a good temperature of both together: and verily there is not a thing in the world againe which hath in the nature thereof so great varietie.

In some countries, if new wine worke of it selfe a second time, it is thought to be a fault and means to corrupt it: and indeed vpon such a chance & vnhappy accident, it loseth the verdure and quick tast: whereupon it gets the name of Vappa, and is clean turned to be dead or soure: in which regard alfo we giue a man that name by way of scorne and reproch, calling him Vappa, when he is heartlesse, void of reason and vnderstanding. If it were vineger indeed it were another matter: for surely though wine degenerate into it by way of corruption and putrefaction, yet a vertue and force it hath good for many speciall vses, and without which it were not possible to liue so delicatly at our table as we do. Moreouer, the world is so much giuen to keepe a bruising, tempering, and medicining of wines, that in some places they sophisticate them with ashes, as it were with plaister: in other, they fortifie, recouer, and make them againe by such deuises as are before specified. But to this purpose they take the ashes to chuse, of vine cuttings, or of the oke wood, before any other. And forsooth if there be occasion to occupie sea water for this purpose, they prescribe them to fetch it far from land in the deep sea; & kept also from mid-March or the Spring Equinox, or at leastwise from mid-Iune, or summer Sunne-lead, and drawn in the night, & when the North wind blowes: but if it be got neere the time of vintage, then it ought to be wel boiled before it wil serue the turn. As for the pitch in Italy, that of Brutium or Calabria is reputed for the best, to trim those vessels which are to keepe wine. There is made of the rosin of the tree Picca (as also in Spain there comes from the wild Pines) a certain pitch which is the very worst, for the rosin of those trees is bitter, dry, & of a strong sauer. The difference and sundry kinds of pitch, as also the maner of making the same, we will declare in the book next following, in the treatise of wild and sauage trees. The faults and imperfections of pitch, ouer and besides those euen now rehearsed (to wit, bitterness, drynes, & strong sent) are known by the founnesse, stinking smoke, and the very adustion thereof. But ye shall know good pitch by these experiments, if the pieces broken from it do shine, if between the teeth it relent and be clammy like glew, and haue a pleasant sharpnes and soure tast withall of the vineger. In Asia the pitch is thought best which comes of the trees in mount Ida. The Greeks esteeme the trees of the hil Pieria chief for this purpose: and *Virgil* commends that of Narycia before all.

But

A But to retorne againe to our brewing and sophistication of wines, they that would seeme to be cunninger, or at leastwise more curious than their fellowes, do mingle therewith blacke Masticke, which is engendred in Pontus, and is like to Bitumen, and thereto adde the root of Iris or the floure de luce, and oile. For this is found by experience. That if the vessels be sered with wax, the wines therein will not hold, but turne soure quickly. Moreouer, we daily see, that better it is to put vp wine into those vessels, wherein vinegre hath been kept afore, than into such as had dulcet or honied wine. *Cato* sets downe a receit to trim and concinnate wine (for that is the very tearme which he vses) in this manner: Take of lie ashes sodden with cuit boiled to the halfe, one fortieth part, temper it with a pound and a half of penniroyall, or salt: and otherwhiles with marble braied & beaten into powder among. He makes mention also of brimstone, but rosin he names with the last. But about al he wills to refresh and renew the wine when it now begins to come to maturity and perfection, with new wine which he calls Tortivum, and I take it, that he means that which ran last out of the wine-presse: which he prescribeth also to be put vnto new wines for to get them a fresher color, as the very tincture of wine: and so it will be also of a more fattie substance, and goe down more glib and merrily. See, see, how many deuises of medicines and slobber sauces the poore wine is forced to endure, and all to please our pallat, our eye, and other senses: and yet ywis we marue that it is so hurtfull to our bodies. Well, would you haue an experiment to know when wine is going, or enclining to be dead and soure; dip therein a thin plate of lead; if it change color, take it for a signe, that it is in the way of decaying. Of all liquors, wine hath this propertie to vinegre, to pal, & into change in vinegre. But a thousand medicines it doth afford, and books of Physick are full thereof. Moreouer, wine lees being dried, will serue as a match to keep fire: and without any other fewell to feed it, ye shall haue it burne and flame of it selfe. The ashes thereof is of the nature of Nitre, and hath the same vertues: and in this regard somewhat more, for that it is found to be more fattie and vntuous.

CHAP. XXI.

Of wine-cellar.

NOW when wine is made and tunned vp in maner afore said, there is as great difference and diuerfitee in the bestowing of it in cellars. They of Piemont about the Alpes, doe put vp their wines in wooden barrels, bound well with hoops, for warmth; and moreouer, if the winter be very cold, they make fires in their cellars or butteries, to keep them for being frozen. I will tell you a strange wonder, yet true and to be verified, not by hearefay but plain sight. There were seen vpon a time whole heaps & huge lumps of wine congealed into ice, by occasion that the hoops of the hogheads burst that contained the wine: and this was held for a prodigious token. For indeed wine of it owne nature will not congeale and freeze, only it will lose the strength, and become apalled in extremitie of cold. In warmer climats and more temperat, they fill their wines into great stands and steanes of earth, which they set into the ground, either ouer the head all whole, or else by halfe, deeper or shallower, according to the situation & temperature of the region. Likewise they giue the wine open aire in some places: whereas in other they keep it close within house in rauenies and cellars. And thereto belong these and such like rules. First, that one side of the wine-cellar, or at leastwise the windows, ought to stand open to the North, or to the East in any wise, where the Sunne riseth at the time of the Equinoctiall. *Item*, that there be no muckhills nor priuies neer: no roots of trees, nor any thing of a strong and stinking sauer: for that wine is of this nature, to draw any smell very quickly into it: and about all, Fig. trees (as well the wild as the tame) be hurtfull to wine-cellar. *Item*, as touching the order of placing the wine-vessels, they ought to stand a pretty distance one from another: for fear of contagion, for that wine is alwaies most apt to catch infection very soon. Moreouer, it matters much of what proportion and fashion the pipes, tubs, and such vessels be made. Those with great bellies and wide mouths, are not so good. Also they must be nealed with pitch, presently vpon the rising of the dog-star: afterwards doused and washed all ouer either in the sea or else salt water, then to bee seasoned and strewed with vine ashes or cley, and being scoured, they ought to sweeten them with a perfume of Myrrhe, which were good to be done also to the very cellars oftentimes. Furthermore, if the wines be weak and smal, they had need to be kept in tubs and hogheads, let downe within the ground: but the strong and mighty wines may lie about

ground in the open aire. Provided alway, that wine vessels be neuer filled top full: but the void part that is left, and stands aboue the wine, would be thoroughly dight with thicke wine made of withered grapes, or sodden wine to the halfe, and saffron mingled withall, yea, and old pitch, together with cuit. Thus also ought the lids and bungs of the vessels to be ordered, with an addition besides of mastick and pitch. In the deep of Winter they must not be vnstoppd and opened in any case, vnlesse the weather be faire and cleare: Neither when the wind is Southerly, or the Moon in the full. This also is to be noted, that the floure or mantle which the wine casts vp to the top, is good when it is white, if it be red, it is a very bad signe, vnlesse the wine it selfe be of that color. Moreouer, if the vessels be hote, or the lids do sweat, it is no good signe. Note also, that the wine which soone begins to mantle and cast vp a floure incontinently, or to veeld another smell than the own, wil not continue long good. As for the cuits, whether they be sodden to the half or the thirds, they ought to be boiled & made when the skie is without a Moon, that is to say, in the change, and vpon no day else. Moreouer, the decoction must be in leads, and not in coppers; with walnuts, among to receiue al the smoke, which otherwise might infect the cuit. In Campaine they let their best wines lie abroad in vessells, euen in the open aire, to take the Sun, the Moone, raine, and wind, and all weathers that come: and this is thought to bee best for them.

CHAP. XXII.

¶ Of auoiding Drunkenesse.

If a man marke and consider well the course of our life, we are in nothing more busie and curious, nor take greater paines, than about wine: as if Nature had not giuen to man the liquor of water, which of all others is the most wholsom drink, and wherewith all other creatures are wel contented, but we thinking it not sufficient to take wine our selues, giue it also to our Horses, Mules, and labouring beasts, and force them against Nature to drink it. Besides, such pains, so much labor, so great cost and charges we are at, to haue it, such delight and pleasure we take in it; that many of vs think, they are borne to nothing else, & can skill of no other contentment in this life: notwithstanding, when all is don, it transports & carries away the right wit & mind of man, it causes fury and rage, and induces, nay, it casts headlong as many as are giuen thereto, into a thousand vices and misdemeanors. And yet forsooth, to the end that we might take the more cups, and poure it downe the throat more lustily, we let it run thorough a strainer, for to abate and gield (as it were) the force thereof: yea, and other deuises there be to whet our appetite thereto, and cause vs to quaffe more freely. Nay, to draw on their drinke, men are not afraid to make poisons, whiles some take hemlocke before they sit downe, because they must drinke perforce then, or els die for it; others, the powder of the * pumish stone, & such like stuff, which I am abashed to rehearse and teach those that be ignorant of such leaudnesse. And yet wee see these that be stoutest and most redoubted drinkers, euen those that take themselves most secured of danger, to lie sweating so long in the baines and brothel-houses for to concoct their surfet of wine, that otherwhiles they are carried forth dead for their labour. Ye shall haue some of them again when they haue been in the hot house, not to stay so long as they may recouer their beds, no not so much as to put on their shirts: but presently in the place, all naked as they are, puffing & laboring still for wind, catch vp great cans and huge tankards of wine (to shew what lustie and valiant champions they be) set them one after another to their mouth, pour the wine downe the throat without more adoe, that they might cast it vp againe, and so take more in the place, vomiting or reuomiting twice or thrice together that which they haue drunke, and still make quarrell to the pot: as if they had been borne into this world for no other end but to spill and make good wine: or, as if there were no way els to spend and wast the same, but thorow mans body. And to this purpose, were taken vp at Rome these forreine exercises, of vaulting and dancing the Morisk; from hence came the tumbling of wraisters in the dust and mire together; for this, they shew their broad breasts, beare vp their heads, and carrie their neckes far backe. In all which gestikulacions, what do they else but profess that they seek means to procure thirst and take occasion to drink? But come now to their pots that they vse to quaffe and drink out of: are there not grauen in them faire pourtrais think you of adulteries? as if drunkenesse it selfe were not sufficient to kindle the heart of lust, to pricke the flesh, and to teach them wantonnes. Thus is wine drunke out of libidinous cups: and more than that, he that can quaffe best and play the drun-

A drunkard most, shall haue the greatest reward. But what shall we say to those (would a man think it?) that hire one to eat also as much as he can drink, and vpon that condition couenant to yeeld him the price for his wine drinking, and not otherwise. Ye shall haue another that will inioine himselfe to drinke euery denier that he hath won at dice. Now when they are come to that once and be thoroughly whittled, then shall yee haue them cast their wanton eies vpon mens wiues; then fall they to court faire dames and ladies, and openly bewray their folly euen before their jealous and sterne husbands; then (I say) the secrets of the heart are opened and layed abroad. Some ye shall haue in the mids of their cups, make their wils, euen at the very board as they sit: others againe cast out bloudy and deadly speeches at randon, and cannot hold but blurt out those words which afterwards they eat againe with the sword point: for thus many a man by a lauish tongue in his wine, hath come by his death and had his throat cut. And verily the world is now growne to this passe, That whatsoeuer a man saith in his cups, it is held for sooth; as if Truth were the daughter of Wine. But say they escape these dangers: certes speed they neuer so well, the best of them all neuer seeth the Sun-rising, so drowsie and sleepey they are in bed euery morning, neither liue they to bee old men, but die in the strength of their youth. Hence comes it, that some of them looke pale, with a paire of flaggie blab-cheekes; others haue bleared and fore eies; and there be of them that shake so with their hands, that they cannot hold a full cup, but shed and poure it downe the floore. Generally they all dreame fearfully (which is the very beginning of their hell in this life) or els haue restless nights: & finally, if they chance to sleep (for a due guerdon and reward of their drunkenesse) they are deluded with imaginary conceits of *Venus* delights, defiled with filthy and abominable pollutions: and thus both sleeping and waking they sin with pleasure. Well, what becomes of them the morrow after? they belch foure, their breath stinketh of the barrell, and telleth them what they did ouer night; otherwife they forget what either they did or said, they remember no more, than if their memory were vtterly extinct and dead. And yet our iolly drunkards giue out and say, That they alone inioy this life, and rob other men of it. But who seeth not, that ordinarily they lose not onely the yesterday past, but the morrow to come? In the time of *Tiberius Claudius* the Emperor, about 40 years since, certaine out-landish Physitians and Monte-banks, who would seem to set themselves out by some strange nouelties of their own, & so get a name, brought vp at Rome a new deuise and order, to drinke fasting, and prescribed folk to take a good hearty draught of wine before meat, and to lay that foundation of their dinner. Of all nations, the Parthians would haue the glory for this goodly vertue of wine-bibbing: and among the Greeks, *Alcibiades* indeed deserved the best game for this worthy feat. But here with vs at Rome *Nouellius Torquatus* a Milanais, wan the name from all Romans & Italians both. This Lombard had gone through all honourable degrees of dignity in Rome, he had bin Pretor, and attained to the place of a Proconsull. In all these offices of state he wooon no great name: but for drinking in the presence of *Tiberius*, three gallons of wine at one draught and before heooke his breath againe, he was dubbed knight by the syname of *Tricongius*, as one would say, * The three gallon knight: and the Emperor, sterne, seuer, and cruell otherwise though he was, now in his old age (for in his youthfull daies he was giuen ouermuch to drinking of wine) would delight to behold this renowned and worthy knight, with great wonder and admiration. For the like rare gift and commendable qualitie, men think verily that *C. Piso* first rise; and afterwards was aduanced to the Prouost ship of the city of Rome, by the said *Tiberius*, & namely, for that in his court being now emperor, he sat 2 daies and 7 nights drinking continually, and neuer stirred foot from the boord. And verily *Drusus Caesar* (by report) in nothing more resembled his father *Tiberius*, than in taking his drink. But to return again to noble *Torquatus*, herein consisted his excellency, That he did it according to art (for this you must take withall, there is an art of Drinking, grounded vpon certain rules and precepts.) *Torquatus* (I say) drank he neuer so much, was not known at any time to falter in his tongue, neuer eased himself by vomiting, neuer let it goe the other way vnder boord: how late soeuer he sat vp at the wine ouer night, he would be sure to relieue the morning watch & sentinel. He drank most of any man at one entire draught before the pot went from his head: and for smaller draughts besides, he went before all other in number; his winde he neuer tooke while the cup was at his mouth, but iustly obserued the rule of drinking with one breath; he was not known to spit for all this: & to conclude, he would not leaue in the cup, so much as would dash against the paucement, & make the least sound to bee heard: a special point and precise law

* not the thrice gallant knight
* Whereupon he was called
Tiberius Nero, for *Tiberius Nero*.

to prevent the deceit of those that drinke for a wager. A singular glory no doubt in him, and a rare felicity. *Tergilla* challenged *M. Cicero* the younger, son to that *M. Cicero* the famous Orator, and reproched him to his face, that ordinarily he drunk 2 gallons at once: and that one time above the rest when he was drunke, he flung a pot at *M. Agrippa* his head. And truly this is one of the fruits and feats of drunkenness. But blame not young *Cicero*, if in this point yet he desired to surmount him that slew his father, *M. Antonius* I mean; for he before that time strained himselfe, and strove to win the best game in this feat, making profession thereof, as may appear by a booke that he compiled and set forth with this title, *Of his owne drunkenness*: wherein hee was not ashamed to avow and justifie his excess and enormities that way: and thereby approoved (as I take it) vnder pretence and colour of his drunkenness, all those outrages of his, all those miseries and calamities that he brought vpon the whole world. This treatise he vomited and spued out a little before the battell of *Actium*, wherein he was defeated: whereby it may appear very plainly, that as he was drunken before with the blood of citizens, so still hee was the more blood-thirsty. For this is a property that necessarily followeth this vice, That the more a man drinketh, the more he may, and is alwaies dry. And herein spake to good purpose a certain Embassadour of the Scythians, saying, That the Parthians the more they drunke, the thirstier they were.

As touching the nations in the West part of the world, they haue their drinks also by themselves made of *corn steeped in water, whereof they will drinke to the utterance, and be drunk: and namely in Spaine and France, where the manner of making the same is all one, howsoever they haue* diuers names: and in Spain they haue devised means that these drinks (Ale or Beer) will abide age, & continue stale. In Egypt likewise they haue inuented such kind of drinks made of corn: so that no part or corner of the world there is, but drunkenness reigneth. And verily these liquors howsoever they be named, they vse to drinke entire as they bee, and made of the very strength of Malt: neuer delaying the same with water, as we do wines. But it may be sayd, That Nature hath endowed & enriched those countries with abundance of corn, and therefore they may wel do it. Oh how industrious we are to maintain our vices! There is a deuise found, (would euer any man haue thought it?) how water also should make men drunke. Two liquors there be, most pleasing and acceptable to mens bodies, wine within, & oile without. Both proceed from two speciall trees, howbeit, of the twaine, Oile is necessary, and Wine may be better spared. And verily, men haue not bin idle in the making of good oile: howbeit, they haue bene more addicted and giuen to make Wines for drink; as may appear by this, that reckoning but the generall kinds thereof, a man may find 195 sorts of wine: but if a man would subdiuide and distribute those heads into their branches, he should meet almost with twice as many: but of Oyles there been not so many kinds by farre. Whereof we purpose to treat in the booke next following.

THE

THE FIFTEENTH BOOK OF
THE HISTORIE OF NATURE,
WRITTEN BY C. PLINIUS
SECVNDVS.

CHAP. I.

¶ The natures of trees that beare Fruit.

Here were no Olie trees grew in Italy, but vpon the coast side, and that within 40 miles of the sea, about the 440 yere after the foundation of the city of Rome; if it be true that *Theophrastus* saith, who was one of the most famous and renowned Authors among the Greeks. *Fenestella* writeth moreover, and affirmeth, that during the raigne of *Tarquinius Priscus* (which was much about the 183 yere from the foundation of the city of Rome) there were no Olie trees at all to be found, either in Italy, Spaine, or Africke: whereas now at this day they are seene all Italy ouer, yea and be come as far as the regions beyond the Alps, euen into the mids and very heart of France and Spaine. Indeed, in the yere after the foundation of Rome 505 (which was when *Appius Claudius*, the nephew of that great *Appius Claudius* surnamed the Blind, and *L. Iunius* were Consuls together) a pound of the oile was sold for twelue Asles: and not long after (namely, in the 680 yere) *M. Seius* the son of *Lucius* (one of the *Aediles Curule* for the time being) brought downe the market so well, that a man might haue bought ten pound for one As; and at that price he serued the people of Rome throughout all that yere. Lesse cause therefore a man hath to maruell hereat, who knoweth how not past 22 yeres after that (namely when *C. Pompeius* was the fourth time Consul) Italy was able to furnish other nations and prouinces with oile of Oliues. *Hesiodus* also (who was especially addicted to the study of husbandry, and of all things thought it most necessarie to be taught and published for the good of mankind) wrote thus much concerning the Oliue, That neuer a man was knowne to that day for to haue gathered the fruit of that Oliue tree, which himselfe had planted: so late of growth were those trees in his time, and so slowly came they forward. But now adaies they come vp of kernels and stones set in plots of ground for the purpose: and being transplanted againe, they beare Oliues the second yere after. *Fabianus* saith, That Oliues loue not to grow either in the coldest or the hottest grounds.

Virgill hath set downe 3 kind of Oliues, to wit, *Orchita* [i. the great round Oliues:] *Radij*, [i. the long Oliues:] and those which are called *Pausae*. He saith moreover, That the Oliue trees require no tending or dressing at all, and need neither the hooke to be pruned, nor the rake and harrow to be moulded, ne yet the spade to be digged about. Doubtlesse, the goodnesse of the soile, and the temperature of the climat especially, are very requisit and much materiall alone, without farther helpe: howbeit they vse to be cut and pruned, yea, they loue also to be scraped, polished, and clenfed between where the branches grow ouer-thicke, euen as well as vines, and at the same season.

The time of gathering Oliues ensueth presently vpon the vintage of grapes; but greater industry and skil is required to the making and tempering of good oile, than about new wine: for ye shall haue one and the self same kind of oliue to yeeld a different iuice, and diuers oiles: first and foremost, of the Greene oliue and altogether vnripe, there is drawne the Oile-oliue; which bath of all other the best verdure, and in tast excelleth the rest: and of this oile, the first running that commeth from the presse, is most commended: and so by degrees better or worse, as the oile

oil is drawn before or after, out of the presse: or, according to a late inuention, by treading them with mens feet in little panniers, and vpon hardles made of small and fine oziars. This is a rule, The riper that the oliue is, the fatter will the oil be, and more plentifull; but nothing so pleasant in tast. And there fore the best season to gather Oliues, both for goodnesse and abundance of oil, is when they begin to shew black. And such halfe-ripe Oliues we in Latine call *Drupæ*, and the Greekes *Drypetæ*. To conclude, it skilleth very much whether the berries be ripe vpon the tree, or mellow within their presse: also whether the tree be watered, that is to say, the oliues hanging thereupon be drenched and refreshed with sprinkling water, or haue no other moisture than their owne, and that which they receiue by dews and raine from heauen.

CHAP. II.

¶ of oyle.

Oile-Oliue commeth to haue a rank and vnpleasant tast if it be old kept and stale, contrary to the nature of wine, which is the better for age. And the longest time that oil will continue good, is but one yere. Wherein surely if a man would well consider, he may obserue the great providence of Nature. For seeing that wines are made to seruise intemperance and drunkennesse, there is not that necessitie to drinke much thereof, and to spend them out of hand: and more than so, the daintie tast that they haue when they be stale, induceth men to lay them vp and keep them long. But contrariwise, she would not haue vs make such spare of oil: and therefore by reason of the generall vse and need thereof, the hath made it vulgar and common to all.

As touching this benefit and gift of Nature bestowed vpon mankind, Italy of all other nations in the world carrieth the name for the goodnesse thereof: but principally the territory or county of *Venafrum*, and namely, that quarter lying toward *Licina*, which yeelds the oil called *Licinianum*: wherupon there be no oliues comparable to them of *Licina*, both for to seruise the perfumers, in regard of the pleasant smell which that oil doth giue, so appropriat vnto their ointments: as also to furnish the kitchen and the table (as they say that be fine toothed, & haue a delicate taste:) which is the cause (I say) that this oil carrieth the only name. And yet these oliues of *Licina* haue this priuiledge besides, that birds loue not to come neere them. Next to these *Licinian* oliues, the question is between them of *Itiria* & *Batica*, whether of them should go away with the price for their goodnesse: and hard it is to say, which is the better of the two. A third degree there is vnder these two aboue named, namely, of the Oliues that come from all other prouinces, setting aside the fertile soile of that tract in *Africke*, which yeeldeth so great increase of corn. For it should seeme that Nature hath set it apart for graine onely, seeing it so fruitfull that way: and hath not so much enuid it the benefit of wine and oil, which she hath denied those parts, as thought it sufficient that they might glory, and haue the name for their haruests. As for other points belonging to oliues, men haue erred and bin deceived very much: neither is there in any part concerning our life, to be found more confusion, than is therein: as we will shew and declare hereafter,

CHAP. III.

¶ The nature of the Oliue berries: also of yong Oliue Plants.

This fruit called the Oliue, consists of a stone or kernell, of oil, a fleshy substance, and the lees or dregs: now by these lees (called in Latine *Amurca*) I mean the bitter liquor of the grounds that the oil yeelds. It comes of abundance of water: and therefore as in time of drought there is least thereof, so in a rainy and watery constitution, you shall haue store and plenty. As for the proper juice of the oliue, it is their oil, and the chiefe is that which comes of those that are vnripe, like as we haue shewed before, when we treated of *Ompharium*, or the Oliue verjuice. This oilie substance doth increase and augment within the Oliue vntill the rising of the star *Arcturus*, to wit, 16 daies before the Calends of *October*; after which time, their stones and carnos matter about them do rather thriue. But marke, when there follows a glut of raine and wet weather presently vpon a dry season, the oil in them doth corrupt and turn all (well neare) into the lees aboue said, which may easily be perceiued by the colour: for it causeth

A feth the Oliue berrie to looke blacke. And therefore when this blacknesse begins to appeare, it is a sign that they haue somewhat (although very little) of the lees; but before that, they had non at all. And herein men are foulyly decieued taking this marke for the beginning of their ripenesse: which blacke hew indeed is a signe of their corruption, and betokens that then they are in the way to be stark naught. They erre also in this, that they suppose an Oliue the more grown it is in carnositie, to be the fuller of oil: whereas in very truth, all the good iuice in them is converted then into the grosse and corpulent substance thereof, and thereby also the stone and kernell come to be big and massie: which is the cause, that they had need of watering at that time, most of all. Which being done by great paine and labour of man, or happening through raine and plenty of showers, vnlesse there insue a drie season & faire weather to extenuate that grosse substance into which the Oliue had turned the foresaid iuice and humor, all the oil is consumed and lost. For it is heat & nothing els (as *Theophrastus* saith) which ingendreth oil: & therefore both about the presse at first, & also in the very garner where Oliues be laid after, they vse to keep good fires, by that means to draw the more oil forth. A third default there is in oil, and that comes of two much sparing and niggardise: for some men there are, who being loth to be at cost to pluck and gather Oliues from the tree, wait still and looke that they should fall of themselves. And such folke as would seeme yet to keepe a meane herein, namely, to take some paines and be at a little cost; beat and pell them downe with perches and poles: whereby they do offer wrong to the poore trees, yea, and hinder themselves not a little the yere following, when they shall find how much it is out of their way, thus to break their boughes and branches.

C Whereupon the law in old time provided well for this inconuenience, by an expresse inhibition to all gatherers of Oliues, in these words, *No man so hardie as to breake, strike, and beat the Oliue tree*. But they that go most warily and gentl to worke, stand vnder the tree, and with some canes shake the boughes and branches therewith, or lightly smite them: but in no case let driue and lay at them either with full down-right or crosse-blowes. And yet as heedfull as they be in so doing, this good they get by striking and knapping off the young shootes and sprigs which should beare the next yere, that they haue the trees carry fruit but once in two yeres for it. The like hapneth also, if a man stay till they fall of themselves: for by sticking on the tree beyond their due time, they rob the oliues to come after, of all their nutriment wherewith they should be fed, and detain the place likewise where they should come forth and grow. An euident prooffe hereof is this, That oliues vnlesse they be gathered before the ordinary & yerearely western winds do blow, they gather heart again vpon the tree, & wil not so easily fall as before. Men vse therefore to gather the *Pausan* Oliues first after Autumne, which are fullest of carnosity, not so much by nature, as by misgouernement and disorder: soone after, the round *Orchideæ*, which haue plenty of oil, & then the oliues *Radij*: and these, forasmuch as they be most tender, and soonest ouercome with abundance of the lees (which we called before *Amurca*) are thereby forced to fall. Howbeit, such oliues as be thick skinned and hard; tough also and admitting no wet & rain (by which means they are the least of all others) wil abide on the tree til *March*: and namely, the *Licinian* Oliues, the *Cominian*, *Contian*, & *Sergian*, which the *Sabins* call *roial*: all which change not colour & look black before the foresaid Western wind blowes, that is, about the 6 day before the Ides of February; for by that time folk think they begin to ripen. Now for as much as the best & most aproued oil is made of them, it seems that reason also being conformable to this defect of theirs, justifies, & aproues the same in the end. And this is commonly receiued and held among them, that cold winters breed scarcity and dearth: but full maturity brings plenty; namely when they haue leisure to ripen on the tree: howbeit this goodnes is not occasioned by the time, but by the nature rather of those kind of oliues, which be long ere they turn into the foresaid dregs *Amurca*. Men are also as much deceived in this, that when Oliues be gathered, they keep them vpon boarded floors in sellars and garner, & will not presse them before they haue swet: whereas, in truth, the longer they lie, the lesse oil they yeeld, & the more dregs of lees. For by this means the ordinary proportion they say is, to presse out of euery *Modius* of Oliues, not aboue 6 pound of oil. But no man makes any reckoning of the lees, how much it increases in measure day by day, in one & the very same kind of Oliues, the longer that they be kept ere they be pressed. In one word, it is a common error settled euery where, that men do think the abundance of oil is to be esteemed according to the signes of the oliues: considering that the plenty of oil consists not in the greatnes of the fruit: as may appeare by those that

of some are called Roiall, of others Majorina, and Phaulia, which euery man knoweth, are the biggest and fairest Oliues to see to, & yet otherwise haue least oile in them of any others. Likewise in Ægypt the oliues are most fleshy & full of pulp, howbeit, least oleous. As for the country Decapolis of Syria, the oliues indeed be very small there, & no bigger than Capers: yet commended they are for their carnosity. And for that cause, the oliues from the parts beyond sea are preferred before the Italian, for goodnesse of meat, and as better to be eaten; yet those of Italy yeeld more oile. And euen within Italy, the Picene and Sidicine oliues surpass the rest. For in truth, these are first confected and seasoned with salt: or els (as all others) prepared & condite either with lees of oile, or wine cuir. Some oliues there be, which they suffer to swim alone as they be, in their owne oile, without any help and addition of other things; and such be called Colymbades. And the same they vse otherwhiles to bruise and cleanse from their stones, and then confect them with green herbs, which haue some pleasant & commendable taste. Others there are, which being otherwise very green and vnripe, are presently brought to maturity, and made mellow, by lying infused and foking in hot scalding water. And a wonder it is to see, how Oliues wil drink in a sweet liquor, and how by that means they may be made toothsome, yea, and to carry the taste of any thing that a man would haue them. Among oliues there be also that are of colour purple, like to those grapes which change colour when they begin to ripen. Moreover, besides the aboue named sorts of oliues, there be some named Superba [i. proud.] Also there are Oliues to be found, which being dried by themselves onely, are passing sweet, yea, and more delicate than raisins: many these are very season, and yet such are in Africke and about the city Emerita in Portugall.

As touching the very oile it self, the way to preserve it from being ouerfat and thick, is with salt. If the barke of an Oliue tree be slit and cut, it will receive the rellice and smell of any medicinable spice, and the oile thereof wil seem aromatized: otherwise pleasant in taste it is not, like as wine is: neither is there such difference in so many kinds of oliues as there is in wine: for surely we cannot at the most obserue about three degrees in the goodnesse of oiles, namely, according to the first, second, and third running out of the presse. Finally, the thinner that oile is, and the more subtile, the finer and daintier is the smell thereof: and yet the same same sent, in the very best of them all, continueth but a small time.

CHAP. III.

¶ The nature of Oile Oliue.

The property of oile is to warm the body, and to defend it against the iniuries of cold: and yet a soueraine thing it is to coole and mitigate the hot distemperature of the head. The Greekes, whom wee may count the very fathers and fosters of all vices, haue peruered the true and right vse thereof, to serue for all excess and superfluitie; euen as far as to the common anointing of their wraisters with it, in their publick place of exercise. Known it is for certain, that the gouernors and wardens of those places, haue sold the oile that hath been scraped from the bodies of the said wraisters for 80 Sesterces at a time.

But the stately maiesty of Rome contrariwise hath done so great honour to the Oliue tree, that euery yere in Iuly, when the Ides come, they were wont to crowne their men of armes and gentlemen marching by their troupes and squadrons in solemn wise, with chaplets of Oliue, yea and the manner was of captains likewise to enter ouant in pety triumphes into Rome, adorned with Oliue coronets. The Athenians also honoured their conquerors with Oliue garlands. But generally the Greekes did set out their victors at the games of Olympia, with branches of the wild-oliue.

CHAP. V.

¶ The manner how to order Oliues.

Now will I report the precepts and rules set down by Cato, as touching oliues. His opinion is, that the greater long Oliue Radius of Salentum, the big Orchites, the Pausia, the Sergiana, Cominiana, and the Albicera, should be planted in hot and fat grounds. He adds moreover (as hee was a man of singular dexterity and prudent spirit) which of them in the neigh-

A neighbour territories and places adjoining, were taken for the best. As for the Licinian Oliues, he saith, They would be planted in a weely and cold hungry ground: for if it be a fat soile and a hot, the oile wil be corrupt and naught, and the very tree it self wil in short time be killed with ouermuch fertility and bearing too great a burden. Moreover, they will put forth a red kind of mosse, which eateth and consumeth the tree. To conclude, his mind is, that Oliue hort-yards should be exposed to the sun, yet so, as they regard the West wind also in any case, for otherwise he commendeth them not.

CHAP. VI.

¶ How to keep Oliues, and the way to make oile of them.

Cato alloweth of no other means to keep and preserve oliues (and specially the great ones, made like cullions, named thereupon Orchita, and the Pausia) but either in brine and pickle when they are Greene, or else among Lentisk branches when they are bruised and broken. The best oile is made (saith he) of the greenest and sourest oliues. Moreover, so soon as euer they be fat, they must be gathered from off the ground; and if they be fouled and beraied with the earth, they ought to be washed clean, and then laid to dry three daies at the most. Now if it fall out to be weather disposed vnto frost, they should be pressed at 4 daies end. He giueth order also, to bestrew and sprinkle them with salt: saying moreover, that if they be kept in bordered sollors or garners, the oile will be both lesse in quantitie, & worse withal. So it wil be also, if it be let lie long in the lees, or together with the cake and grounds, when they be bruised and beaten: for this is the very fleshy and grosse substance of the Oliues, which cannot chuse but breed filthy dregs. And therefore he ordaineth, that oftentimes in a day it should be poured out of one vessell into another, & so by setting clarified from the grounds, & then to put it vp afterwards into pans and panchions of earth, or els into vessels or kinnels of lead, for brasse metall wil mar oile. All this should be done within close presses and rooms, and those kept shut, where no aire or wind may come in, that they might be as warm and hot as stoues. He forbids also to cut any wood or fuel there, to maintain fire; for that the fire made of their stones and kernels, is most kindly of any other. To the end also that the grounds & lees should be liquified and turn into oile, euen to the very last drop, the oile should be let run out of those vessels or kinnels afore said into a vat or cistern; for which purpose the vessels are often to be clenfed, & the ozier paniers to be scoured with a sponge, that the oile might stand most pure & clear. But afterward came vp the deuise to wash oliues first in hot water, & then immediately to put them whole as they are, into the presse, for by that means they squeeze forth lees & all: and then anon to bruise and crush them in a mil, & so presse them in the end. Moreover, it is not thought good to presse the second time about 100 Modij, which is the full proportion of one presse, & it is called Factus. That which after the mil comes first, is named the floure of the oile, or the Merc-gout. Lastly, to presse 300 Modij, is thought to be foure mens work ordinarily in one night and a day.

CHAP. VII.

¶ Of Oile Artificiall

IN Cato his time there was no artificiall Oiles, I mean, no other but that of the Oliue; and therefore I suppose it was, that he made no mention thereof: but now adaies there be many kinds. First will we treat of those that are made of trees, and principally before all the rest, of the oile of the wild oliue: thin it is, and much more bitter than that of the other gentle & true Oliue, but good for medicines onely.

Very like to it, is that which is made of Chamelæa, an herb or shrub growing in stony places to the height of a span & no more, with leaues and berries resembling those of the wild oliue.

The next is that which commeth of Cici, or Ricinus, [i. Palma Christi] a plant which groweth plentifully in Ægypt, which some call Croto, others Trixis or wild Sesam; but long it hath not been there. In Spaine likewise this Ricinus is found of late to rise suddenly to the height of an Oliue tree, bearing the stalke of Ferula or Fennel-Geant, clad with leaues of the vine, replenished with seed resembling the graines or kernels of small and slender grapes, and of a pale colour withall: we in Latine call it Ricinus, of the resemblance that the seed hath to a tickle,

which is a vermin that annoies sheepe. For to gather an oile thereof, the manner is to seeth the seeds in water, the oile wil swim aloft, and so it is scummed off. But in Egypt (where there is a bundance thereof) they neuervse any fire or water about it; only they corn it well with salt, and then presse out the oile, which is very fulsome and naught to be eaten, good only for lamps.

The oile of Almonds, which some call Metopium, is made of the bitter Almonds, dried stamped, and reduced into a masse or lumpe, which being sprinkled and soaked with water, and then beaten againe in a mortar, is put into a presse or mill, and the oile drawne therout.

There is an oile made also of the Bay, together with the oile of ripe oliues ready to drop from the tree. Some take the Bay berries only, and thereout presse oile de-Baies; others vse the leaues and nothing els: and there be againe, who with the leaues take also the rind of the Bay berries; yea and put thereto Storax Calamita, and other sweet odors. Now for this purpose, the Laurell with broad leaues growing wild, and bearing blacke berries, is the best.

Like unto this oile, is that which they make of the blacke Myrtle; and the broad leaved kind thereof is the better: the berries of it ought to lie infused first in hot water, and afterwards to be boiled. Some seeth the tenderest leaues that it hath in Oile-Oliue, and then presse them forth. Others put the leaues first in the oile, & then let them stand conseeded in the sun, and there take their ripening.

After the same manner is the oile made of the garden Myrtle; but that of the wilde which hath the smaller seed is the better: and this Myrtle some call Oxymyrine, others Chamemyrsine; and some againe name it for the smalnesse, * Acaron, for short it is and full of little branches.

Moreouer, there be oiles made of the Citron and Cypress trees: likewise of wall nuts which they call Caryonion: also the fruit of the Cedar, named Cedrelaon.

Semblably of the graine called Gnidium, to wit, the seed of Chamelæa and Thymelæa, well elensed and stamped. In like manner of the Lentisk. As for the oile Cyprinum, how it should be made of the Egyptian nut, and of Ben for to serue perfumers, hath bin shewed before. The Indians (by report) do make of Chest-nuts, of Sesame seed, & Rice. The people Ichthyophagi as they liue by eating fish only, so they make oile of fishes. And in case of necessity, otherwhiles men vse to draw an oile out of the berries of a Plane tree also, beeing steeped in water and salt, which serues for lamp oile. Yea and there is an oile made of the wild vine Oenanthe, as we haue said already in the treatise of Ointments.

As touching the oile which the Greeks call Gleucinum, it is made with new wine and oile-oliue, boiled at a soft fire. Others there be that let the wine consume all into oile, and without any fire at all, do compass the vessell wherein this composition is made, with the cake and the refuse of grapes when they be pressed, and couer it all ouer for the space of 22 daies, so as twice a day they be all mixed thoroughly together. Some there be who put therto not only Majoram, but also the most precious and exquisite odors that they can meet withal: and our common fencing-halls, and places of publick exercises be perfumed with these sweet oiles, and do smell of them; but such they be as are the cheapest of all other.

Ouer and besides, there is made an oile of Aspalathus, sweet Calamus, Balme, Iris or Flour-de-lis, Cardumome or grains of Paradise, Melilot, French Nard, Panace, Marjoram, Elecampane, and the root of Cinamon, taking all these and letting them lie infused in oile, and so pressing out the iuice thereof. So is oile Rosat made of Roses: the oile of Squinanth of the russh, which is most like to the Oile Rosat. Likewise of Henbane, Lupines, and the Daffadill: the Egyptians get great store of oile out of Raddish seed, or the grasse called Gramen (which is Dent-de-chien or Quich-grasse) and this oile they call Chortinon. After the same manner the Sesame-seed doth yeeld an oile, as also the Nettle, which in Greeke they call Cnecion, or rather Cnidium. As for the oile of Lillies, it is made in some places, where they feare not to let it stand abroad in the aire infused to take both Sun and Moon-shine; yea and frosty weather.

They that inhabit between Cappadocia and Galatia, do compound a certain oile of herbes growing among them, which is a foueraigne remedy for sinewes either wounded or otherwise grievied, and they call it Selgiticum: it is much in effect like to that oile which is made in Italie of Gums, by the people Eguini.

Now for the oile of Pitch, which they call Picinum, it is made of the vapors and smoke that arise from Pitch whiles it boileth, and receiued in fleeces of wooll spread ouer the pots mouth wherein

A wherein the said Pitch is foddren: which fleeces afterwards are well wrung, and the oile is pressed out thereof. The best oile is that which commeth from the Brutian or Calabrian pitch: the same is most fat of all others, and fullest of Rosin. The colour of the oile is reddish.

Vpon the coasts and maritime parts of Syria, there is an oile engendereth of it selfe, which the Greeks call Elaomeli: a fatty and greasie substance it is, thicker than honey, and thinner than Rosin, of a sweet tast, issuing out of trees; and is onely medicinable and good in Phyticke.

As touching old oile, it serues in right good stead for sundry sorts of maladies. It is thought also very singular for to preserve luorv from putrefaction, for this is certaine, that the image of Saturne at Rome is full of oile-oliue all within.

CHAP. VIII.

¶ Of the lees or dregs of Oile-oliue, called Amurca.

Cato hath highly commended aboue all, the lees of Oile-oliue: for he would haue the barrels, hog heads, and other vessels which hold oile, to be therewith besmeared, that they should not drink vp the oile. He deuised also, that the threshing floors should be wrought and tempered with oile lees, that they might not chawne & gape, nor no Ants breed within the chinks and cranies thereof. Moreouer, he thinks it very good that the mortar, plaister, and parget vsed about the wals of corn barns, as also their floors, should be well sprinkled and tempered with the said lees; yea, and the presses and wardrobes where apparell is kept, ought to be rubbed therewith to keep out mothes, worms, spiders, and such vermine that do hurt to cloths. He

affirmeth besides, that is good against certain diseases of four-footed beafts, as also to preserve trees, yea and excellent for inward vlcers of a mans body, but especially those of the mouth. Beeing foddren, it is singular good (as he saith) for to annoint and make gentle and supple all bridle reins, leather thongs, shoes, and axletrees of carts and wagons; likewise to keepe all vessels of brasie from rust, and also to giue them a bright and pleasant colour: moreouer, all the wooden implements of an house generally throughout, and vessels made of earth and clay, wherein one would keep dry figs in their verdure, would be annointed therewith: or if one were desirous to preserve the Myrtle, leaues, fruit, and all, vpon the branches, or any such thing, there is nothing better than the said Amurca. Last of all, he saith, that what wood soeuer for fell is dipped in these lees, it will burne cleare without any smoke.

M. Varro affirmeth, that if a Goat chance to lick with his tongue, or to brouse an oliue when it buddeth the first spring, the same tree will surely be barren and lie in great danger to miscary and die. Thus much of the Oliue tree, and of the oile of Oliues.

CHAP. IX.

¶ All kinds of Fruit good to eat, and their Nature.

E AS for all other fruits of trees, they are hardly to be numbred and reckoned by their forme and figure, much lesse by their sundry tastes and diuers iuices that they yeeld, so intermingled they are together by varietie of grafting one into another.

CHAP. X.

¶ Of Pine-nuts, or Pine-apples, foure sorts.

THE Pine nuts (which are the biggest of that kind and hanging highest vpon the tree) doe contain and nourish slender kernels enclosed within certaine hollow beds full of holes, and besides clothed and clad with another coat or husk of a dark murrey colour: wherein may be seen the wonderfull care and providence of Nature, to bestow the seedes so soft. A second kinde there be of these Nuts called Terentines, hauing a shell or huske verie brittle and easie to be cruised between ones fingers; and as soon are they pecked through with birds bills, who after that manner filch and steale them from off the tree. A third sort yet there is of them, that come of the gentle pitch trees, hauing their kernels couched within a thin husk or skin more like than a shell, and the same so soft, that it may be chewed and eaten together with the kernell. Now there is a fourth fruit growing of the wild Pine, and called those nuts are of the Grecians, Pitydia

dia; and these be singular good against the cough. The Taurines in Calabria, haue a deuice to conſect Pine-nut kernels, by ſeething them in hony; and being thus condite, they call them Aquiceli. To conclude, at the ſolemne and feſtiuall games holden at Iſthmus, they who win the beſt prize, are woont to be crowned with a chaplet of the Pine.

CHAP. XI.

¶ Of the Quince.

Next to Pine apples, for big and large, are the Quinces which we call Coronea, the Greeks Cydonea, becauſe they were firſt brought out of Candy. So heauy and maſſie they be, that they bend the boughs to the ground as they hang vpon the tree, and will not ſuffer their mother to grow.

Many kinds there be of Quinces, to wit, Chryſomela, of a colour inclining to gold, and diuided by certain cut lines. Secondly, there be the quinces of our own country, & ſo called: theſe be whiter, and of an excellent ſmell. They alſo that come out of the realm of Naples, be highly eſteemed. Now there be a ſmaller ſort of the ſame kind called Struthea (i. the Peare-quince) and thoſe do caſt a more odoriferous ſmell: late they beere they come to ripeneſſe or perfeſtion; whereas contrariwiſe the green quinces called Muſtea, be as haſty and ſoon melow. Now if a man do graffe the great quinces vpon the Struthea, the tree wil bring forth a kind of quinces by themſelues called Muluiana; and theſe are the quinces alone of all other that may be eaten raw. In ſum, all the ſort of theſe are come now adae to be entertained within the waiting or preſence chambers of our great perſonages, where men giue attendance to ſalute them as they come forth euery morning; and in bed-chambers alſo they are to garniſh the images ſtanding about the beds-head and ſides.

There are beſides ſmall wiild quinces, next to the Peare quince Struthea, for pleaſant and odoriferous ſmell; and they grow commonly in hedge-rows.

Moreouer, as wel Peaches as Pomegranats, notwithstanding they be of a diuers kind, yet wee call Mala (i. apples.) As for the Pomegranats, we haue ſpoken of nine ſorts of them in our treatiſe of their trees, and others in Africk: and theſe are full of certaine graines or kernels lying incloſed vnder their rinde; whereas Peaches haue in ſtead thereof, a groſſe ſtone or woody ſubſtance within the carnous pulpe of the fruit. To conclude, there be certaine peares weighing a pound, in regard of which poiſe and bigneſſe that they beare, called they are Libralia.

CHAP. XII.

¶ Of the Peach, and ſoure kinds thereof.

OF all Peaches, the principall be thoſe which are named Duracina, for the ſolid ſubſtance of the meat within them. As for the French and Aſiaticke Peaches, they beare the name of the regions and nations from whence they come. This fruit ordinarily waxeth ripe after the fall of the leaſe, or Autumne: but the Abricoſts are ready to be eaten in Summer. Theſe haue not bin known full 30 yeares, and at their firſt comming vp, were ſold for Roman deniers a peece, whereof there be two ſorts; Supernatia, which we haue from the high countries, & namely the Sabines; and Popularia, which grow common euery where. Theſe fruits be harmleſſe, and much deſired of ſicke folke: and for that they are in ſuch requeſt, there would be giuen otherwhiles 30 ſeſterces for one of them, which is a price as high as of any other fruit whatſoeuer: whereat we may maruell the rather, for that there is not any ſooner gone, and laſteth leſſe while than they: for being once gathered from the tree, they will not be kept about two daies at the moſt, and therefore muſt of neceſſitie be ſold and ſpent out of hand.

CHAP. XIII.

¶ Of the Plum-tree, eleuen kinds of them.

TO come now to Plums, there is a world of them: ſome of ſundry colours, others black, and ſome againe white. There be that are called Hordearia, becauſe they be ripe in barly-harueſt: and ſome there be of the ſame colour, yet later ere they ripen, and bigger beſides; and

and for that they be of ſmall reckoning, named they are Aſinina [i. * Aſſe-plums.] Ye ſhal haue of them that be black, howbeit the yellow wheat-plum like virgin-wax, and the purple, are better eſteemed. Moreouer, there are a kind of Abricoſts come from a forraine nation, and they be called thereupon Armeniaca, which alone for their ſmell alſo are commendable. But there is a peculiar brauerie and a ſhameleſſe, which thoſe Plums haue by themſelues that are graſſed in Nut-tree ſtocks; they retain the face and forme ſtill of the mother graffe, but they get the taſte of the ſtock wherein they are ſet, as it were by way of adoption: of them both they carry the name, and are called nut-plums. Now, as wel theſe, as Peaches, yellow wheat-plums, & the wild Bullaiſe, may be kept and preſerued as grapes in Autumne, within certain barrells or earthen veſſels; and ſo they will continue good till new come. As for all other plums, as they be ſoon ripe, ſo they are as ſoone gone.

B It is not long ſince, that in the realm of Granada and Andaluſia, they began to graffe plums vpon apple-tree ſtocks, and thoſe brought forth plums named Apple-plums: as alſo others called Almond-plums, graſſed vpon Almond-ſtocks; theſe haue within their ſtone a kernel like an Almond: and verily there is not a fruit again wherein is ſeene a wittier deuice to conioine and repreſent in one and the ſame ſubieſt, two diuers ſorts.

As for the Damafcene-plums (taking name of Damafco in Syria) we haue ſufficiently ſpoken thereof in our treatiſe of ſtrange trees: and yet long ſince they haue bin knowne to grow in Italy: which although they haue a large ſtone and little carnoſity about them, yet they neuer wither into wrinkles and riuels when they be dry, for that they want the full ſtrength of the kind Sun which they had in Syria.

C We ſhould do wel to write together with them, of the fruit Sebeſten, which alſo come from the ſame Syria, albeit now of late they begin to grow at Rome, being graſſed vpon Soruices. As touching peaches in generall, the very name in Latine, whereby they are called Perſica, doth euidently ſhew that they were brought out of Perſia firſt; and that it is a fruit not ordinary either in Greece or Natolia, but a meere ſtranger there. Contrariwiſe wilde plums (as it is well knowne) grow euery where. I maruell therefore ſo much the more, that *Cato* made no mention thereof, conſidering that of purpoſe he ſhewed the maner, how to preſerue and keep diuers wilde fruits, till new came: for long it was firſt ere Peach trees came into theſe parts, and much adoe there was before they could be brought for to proſper with vs, ſeeing that in the Iſland Rhodes (which was their place of habitation next to Egypt) they beare not at all, but are altogether barren. And whereas it is ſaid, That Peaches be venomous in Perſia, & do cauſe great torments in them who do eat thereof; alſo that the KK. of Perſia in old time cauſed them to be transported ouer into Egypt by way of reuenge to plague that country; and notwithstanding their poiſonous nature, yet through the goodnes of that ſoile they became good and holeſom: all this is nothing but a meere fable & a loud lie. True it is indeed, that the beſt writers who haue been painful about others to ſearch out the truth, haue reported ſo much concerning the tree Perſea; which is far different from the Peach tree Perſica, & beareth fruit like to Sebeſten, of color red, and willingly would not grow in any country without the Eaſt parts: and yet the wiſer & more learned Clerkes do hold, That it was not the tree Perſea which was brought out of Perſia into Egypt, for to annoy and plague the country, but that it was planted firſt by K. *Perſeus* at Memphis. Whereupon it came, that *Alexander* the Great ordained, That all victors who had won the prize at any game there, ſhould be crowned with a chaplet of that tree, to honor the memoriall of his great grandfathers father. But how euer it be, certaine it is that this tree continueth greene all the yere long, and beareth euermore fruit one vnder another, new and old together. And to returne again to our Plum-trees, euident it is that in *Cato's* time they were not knowne in Italy, but all the Plum-trees which we now haue, are come ſince he died.

CHAP. XIII.

¶ Of nine and twenty kinds of Fruits, contained vnder the names of Apples.

OF Apples (that is to ſay, of fruits that haue tender ſkins to be pared off) there bee many ſorts. For as touching Pome-citrons, together with their tree, we haue already written. The Greeks call them Medica, according to the name of the country from whence they firſt came in old time. As for Iujubes, alſo the fruit Tuberes, they bee likewiſe ſtrangers as

well as the rest; and long it is not since they arrived first in Italy; the one sort out of Africk, the other, namely Iujubes, out of Syria: & *Sextus Papinius* (whom my self in my time saw Consul of Rome) was the first man that brought them both into these parts; namely in the later end of *Augustus Caesar* the Emperor, and planted them about the rampiers of his campe, for to beautifie the same. Howbeit, to say a truth, their fruit resembled rather berries than apples; yet they make a goodly shew vpon the rampiers: and no maruell, since that now adayes whole groves of trees begin to ouertop and furrmount the houses of priuat persons.

Concerning the fruit Tuberes there be two sorts thereof, to wit, the white and the reddish, called also Sericum, of the colour of silke.

The Apples named Lanata are held in manner for strangers in Italy, and are knowne to grow but in one place thereof, and namely within the territory of Verona. Couered they be all ouer with a kind of down or fine cotton, which albeit both quince and peach be clad and ouergrown with in great plenty, yet these alone cary the name thereof: for otherwise, no special propertie are they known by to commend them.

A number of apples there are besides, that haue immortalised their first founders and inventers, who brought them into name, & caused them to be known abroad in the world; as if therein they had performed some worthy deed beneficiall to all mankind. In which regard, why should I think much to rehearse & reckon them vp particularly by name? for if I be not much deceived, thereby will appeare the singular wit that some men employed in grafting trees; and how there is not so small a matter, so it be wel and cunningly done, but is able to get honor to the first author, yea, and to eternise his name for euer. From hence it comes, that our best apples take their denominations of *Matius*, *Cestius*, *Manlius*, & *Claudius*. As for the quince-apples, that come of a quince grafted vpon an apple stock, they are called Appiana, of one *Appius* who was of the *Claudian* house, and first deuised and practised that feat. These apples cary the smel with them of quinces: they beare in quantitie the bignesse of the *Claudian* apples, and are in color red. Now lest any man should think that this fruit came into credit by reason only of partiall fauor, for that the first inuentor was a man descended from so ancient & noble a family, let him but think of the apples Sceptiana, which are in as great request as they for their passing roundnesse; and they beare the name of one *Sceptius* their first inuentor, who was no better than the son of a slave lately enfranchised. *Cato* maketh mention of apples called Quiriana, as also of Scantiana, which he saith the maner is to put vp in vessels and so keep them. But of all others, the last that were adopted, and tooke name of their patrons and inuentors, be Petisia: though they be little, yet are they passing sweet and pleasant to be eaten.

Other apples there are that haue ennobled the countries from whence they came, and caried their names, to wit, Camerina and Gracula. All the rest took name either vpon some occasion or propertie that they haue: to wit, of brotherhood, as the twin-apples Gemella, which hang one to another by couples, and neuer are found single, but alwaies grow double: of their color, as the Serica, which for their fresh hew are so called: of kinred and affinitie, as the Melapia: for their resemblance and participation of apples and peares together, as a man would say, Peare-apples, or pom-poures: of their hasty ripenesse, as the Mustea [i. hasty apples;] which now of their sweet tast of hony, are called Melimela [i. hony apples;] also of their exquisite roundnesse like a bal, as the Orbiculata [i. the round apples.] That these apples came first from their native country Epirus, appeareth by the Greeks, who call them Epirotica. Again, some there be that take their denomination of their forme, resembling womens paps or breasts, as namely Orthomastica, [i. the Breast-apples.] Others, for that their condition is to haue no pepins or seed within them, be called of the Belgians, Spadoma, as one would say, Guelded apples. As for the Meliosolia, [i. the leafe apples] they be so called, because they haue one leafe and otherwhile twain breaking forth of their side in the very mids. The ragged apples Pannucea take this name, for that of all others they soonest be riuelled. The Puffes named Pulmonea are hoven foolishly, and swell I cannot tell how, with little or nothing in them. Some in colour resemble bloud, they are so red, because at first they were grafted vpon a mulberry. But all apples ordinarily are red on that side that regardeth the Sun.

As for wildings and crabs, little they be all the sort of them, in comparison: their tast is well enough liked, and they cary with them a quick and sharp smel: howbeit this gift they haue for their harsh sourenesse, that they haue many a foule word and shrewd curse giuen them, and that they

A they are able to dull the edge of any knife that shal cut them. To conclude, the Dacian Apples are of all others in manner least accepted, notwithstanding they be first mellow, and would be gathered betimes.

CHAP. XV.

¶ Of Peares. And of the varietie of grafting.

Vpon the same cause there be Peares also reproched with the name of Pride, and are called the Proud-peares: little they are, but quickley ripe, and as soone gone. Of all others the Crustumine peares be most delicate and pleasant in tast. Next to them in request are the B Falern peares, so called for their great abundance of liquor, as it were wine, whereof they be full. And these are likewise named the milk-peares: but such of them as are of color black, be called the Syrian peares. As for other peares, they haue sundry names according to the countries where in they grow. Howbeit these peares following, retain their name still in all places, and represent alwaies the memoriall of those that first planted or grafted them, to wit, Decimiana of one *Decimus*, a known citizen of Rome: of which is also a bastard kind which they call Pseudodecimiana. Likewise, the Dolobellian peare, of one *Dolobella*: and those are of all other the longest tailed. As touching the Pompeian peares, which be also called the Pap or Teat-peares, the Licrian, the Seuerian, and of their race the Tyrannian, they differ one from another in the length of their steale. The red Faonian peares be somewhat greater than the abouenamed Proud-peares. As for the Laterian and Anitian, which be not gathered nor ripen vntill Autumne be past, they haue a prettie tart and fourish tast, but nathelesse pleasant ynough. The Tyberian peares beare the name of *Tiberius* the Emperor, for that of all others he loued that fruit best: they might go for Lycerians well ynough, so like they be vnto them, haue onely that they grow big, and are more deeply coloured with the Sunne.

Moreover, there are peares which are knowne by no other name than of the countries where they grow, namely, those of America which be more lateward than any other: the Picentine, Numantine, Alexandrine, Numidian, Grecian, and among them the Tarentine. Also the Signine peares, which many call Testacea, of the color of earthen pots that they resemble; like as others be named Onychium, for that they represent the Onyx stone, or a mans naile; as likewise those which be called Purple-peares.

D Furthermore, peares take their name of the odour which they yeeld: thus there be Myrapia, to wit, Aromaticall-peares, Laurell, and Nard-peares. Of the time also when they be ripe, as the Barley-pears: of the forme of their neck, as the Bottle-peares called Ampullacea: of their thick skin, as the Coriolana. As for the Gourd-pears, they are by nature of a brutish or savage kind; so harsh, so soure and eager a liquor they doe yeeld.

Many sorts of peares there are, whereof we can giue no certain reason for their denomination, namely, the Barbarian and Venerian peares, which also be called Colored: likewise, the roiall peares, which hang or rather sticke flat to the tree, so short a steale they haue. The Patritian also and Voconian peares, which are both green and long. Moreover, *Virgil* hath spoken of the E Voleman peares or wardens, which he had from *Cato*, who also nameth the Sementine or the hasty and soon ripe peares. So as in this point verily the world is growne alreadie to the highest pitch, inso much, as there is not a fruit, but men haue made trial and many experiments, for euen in *Virgils* daies the deuise of grafting strange fruits, was very rife: considering that he speaks of the Arbut tree grafted on Nut-trees, the Plane vpon Apple-trees, and the Elme vpon Cherrie stockes. In such sort, as I see not how men can deuise to proceed farther. And certes for this long time, there hath not bene a new kind of Apple or other fruit heard of.

And yet as industrious as men haue been that way, they are not permitted to graffe all manner of trees indifferently one in another, no more than it is lawfull to graffe vpon bushes and thornes: seeing that it is not so easie a matter to appease lightnings: for looke how many sorts of trees are thus engrafted contrarie to nature, so many kinds of lightnings and thunderbolts by report, are flashed and shot at once.

Peares naturally are more sharpe-pointed at one end than Apples. And among them, the Greeke peares, the Gourd and Laurell peares are last of all others ripe, for they hang vpon the tree vntill Winter, and they mellow with very frost: like as the Amerine and Scantiane apples.

Furthermore, peares are kept and preferred as grapes, and after so many waies: but none of them

them are put in barrels as plums be. Finally, Peares and Apples both, haue the properties of wine: and in like sort Physicians be wary how they giue them to their patients. Howbeit, when they be foddren in wine and water, they serue in stead of a broth or grewell: & so do no fruitels but Pome and Peare-Quinces.

CHAP. XVI.

¶ The manner how to preserve Apples.

The generall rules to keep and preserve Apples, are these, *Imprimis*, That the solars be wel plankd and boarded in a cold and drie place; provided alwaies, that the windows to the North do stand open, especially euery faire day. *Item*, to keep the windows into the South shut, against the winds out of that corner: and yet the North winds also where they blow, doe cause Apples to shrink and riuell illsaouredly. *Item*, That Apples be gathered after the Equinox in the Autumne: and neither before the full of the Moone, nor the first houre of the day. Moreouer, that all the Apples which fell, be seuered from the other by themselves, and laid apart: also that they be bedded vpon straw, mats, or chaffe vnder them: that they be so couched as that they touch not one another, but haue spaces between to receiue equall aire for to bee vented. To conclude, this is well knowne, that the Amerine Apples, doe last and keepe good long, whereas the honie Apples will abide no time.

CHAP. XVII.

¶ How to keep Quinces, Pome-granats, Peares, Soruisses, and Grapes.

For the good keeping and preserving of Quinces, there must be no aire let into them where they are enclosed: or else they ought to be conserved in foddren honey, or boiled therein.

Pomegranats should be plunged into sea-water boiling, and so hardened therein: and after that they be dried in the Sun three daies, (so as they be not left abroad in the night to take dew) they would be hanged vp in a solar, and when a man list to vse them, then they must be wel washed in fresh water. *M. Varro* sets downe the manner to keep them within great earthen vessels, in sand. And if they be not ripe, he would haue the earthen pots bottomes broke off, and so the Pomegranates to be put in, and covered all ouer with mould: but the mouth thereof must be well stopp'd for letting any aire in, provided alwaies, that the Steele and the branch wherto the fruit groweth, be pitched. For so (quoth he) they will not giue ouer to grow still, yea, and proue bigger than if they had remained vpon the tree. As for other Pomegranats [i. that are ripe] they may be wrapped and lapped one by one in fig-leaues, such as are not fallen, but plucked from off the tree Greene, and then to be put into twigge paniers of oifiers, or else daubed ouer with potters clay.

He that would keep Peares long, must put them in earthen vessels turned with the bottomes vpward, well varnished or annealed within, covered also with saw dust or fine shauings, and so entered. As for the Tarentine Peares, they abide longest on the tree ere they be gathered. The Anitian Peares be well preserved in cuit-wine.

As for Soruisses, they are kept also in trenches within the ground, but the couer of the vessel whereinto they are put, ought to be well plastered all ouer, and so stand two foot covered with earth: also they may be set in a place exposed open to the Sun, with the bottome of the vessels vpward: yea, and within great barrels they may be hung vp with their branches and all, after the manner of grape-clusters.

Some of our moderne writers handle this argument more deeply than others, and fetch the matter farre off, giuing out rules in this manner, saying, That for to haue Apples or Grapes *de garde*, that is to say, fit to be preserved, and to last long; the trees that beare the one and the other, ought to be pruned and cut betimes, in the waine of the Moone, in faire weather, and when the winds blow drie. Likewise they affirme, That fruits to be preserved, would be chosen from drie grounds: gathered before they be full ripe: and this would be looked vnto in any hand, that the Moon at the gathering time, be vnder the earth, and not appearing in our hemisphere. And more particularly, for Grape bunches they would be gathered with a foot or heele from the old hard wood, and the Grapes that are corrupt and rotten among the rest, be clipped off with a paire

A paire of sheers, or plucked out with pincers: then to be hung vp within a great new earthen vessel well pitched, with the head or lid thereof thoroughly stopp'd and plastered vp close, to exclude all aire. After which manner, they say Soruisses and Peares may be kept, but so, as in any case the twigs and steeles whereby they hang, be well besmeared with pitch. Moreouer, order would be giuen, that the barrels and vessels wherein they are kept, be far ynough from water. Some there be again who keep Grapes together with their branch, after the same maner in plaster: but so, as both ends of the said branch sticke in the head of the sea-Onion Squilla: and others let Grape-clusters hang within hog sheads and pipes hauing wine in them: but so, as the Grapes touch not the wine in any case. There be also that put Apples and such fruits in shallow pans or pancheons of earth, and let them swim and floe aloft vpon the wine within their vessels: for besides that this is a way to preserve them, the wine also (as they think) will thereby get a pleasant & odoriferous taste. Others ye haue besides, that chuse rather to preserve al these fruits, as well Apples, Peares, &c. as Grapes, couered in Millet seed. Howbeit, the most part dig a trench or ditch two foot deep in the ground, they floore it with sand in the bottome, and lay their fruits thereupon; then they stop the top with an earthen lid, and afterwards couer al with earth. Some there are which smeare their bunches of Grapes all ouer with potters clay; and when they are dried in the Sun, hang them vp in solars for their vse: and against the time that they should occupie them, steep them in the water, and so wash off the foresaid clay. But for to keep Apples that are of any worth, they temper the same clay with wine, and make a mortar, thereof, wherein they lap the said Apples. Now if those Apples be of the best kind and right

B foueraigne, after the same sort they couer them with a crust of the like past or mortar, or else clad them within a coat of wax: and if they were not fully ripe afore, they grow by that means and break their crust or couer what euer it be. But this would not be forgotten, that they vse alwaies to set the Apple or fruit vpriight vpon the taile, howsoeuer they be kept. Some there are who gather Apples and such like fruit with their slips and sprigs, hide them within the pith of an Elder tree, and then couer them in earth, as is before written. And others there are, who for euery Peare or Apple, haue a seuerall earthen pot, and after that their lids be well closed and stopp'd with pitch, then they enclose them again with great vessels or tuns. Nay ye shal haue some to lap them with flocks and wooll; and so put them in cases, and them they see wel luted with mortar made of clay and chaffe tempered together. Some order them in the same sort, but they put them in earthen pans: and others make no more adoe, but dig a hole in the ground, floore the bottom with a course of sand, put the Apples or fruit within, & then anon when they are thus buried, couer all with mould. These be that vse Quinces in this wise; they take them, anoint them with wax comming out of Pontus, and let them afterwards to ly covered in hony.

Columella mine Author reporteth, That fruits will keep well in earthen pots thoroughly pitched, and afterwards set in pits, and drenched in cisternes of water. In the maritime coasts of Liguria next to the Alpes, they vse to take Grapes after they be dried in the Sun & wrap them within bands of rushes and reeds, put them vp in little barrels, and stop them close with plaster. The Greeks haue the same fashion: but they take for that purpose, the leaues of the Plane-tree, of the vine it selfe, or else the fig-tree, after they be dried one day in the shade: and when they be in the barrell, betweene euery bed of grape clusters, they couer a course of grape kernels, and such refuse remaining after the presse. And in this manner are the grapes of Coos and Berytus preserved: and for sweetnesse and pleasant taste, there are no better to be found. And some there be, that for to counterfeite these excellent Grapes, besmeare them with lie ashes so soon as euer they be pulled from the Vine, and presently drie them in the Sunne: which done, they enwrap them within leaues, as hath been said before, and so couch them close within the cake of pressed grapes. Neuerthelesse, there be diuers that chuse rather to keepe Grapes in the saw dust or shauings of Firre-wood, Poplar, or Ash. Some are afraid to let grapes hang neer to Apples, Pomegranates, and such like fruit, and therefore giue in charge to let them presently after they be gathered, for to be hung vp in garners or boarded lofts: supposing that the dust which they gather from aboue, is the best couer to defend and preserve them. The remedie to keepe Wespes from them, is to spurt or squirt oile out of a mans mouth vpon them. And thus much concerning the way to preserve Grapes and other fruits aforesaid. As for Dates, we haue spoken sufficiently before of them.

G

OF all other fruits that haue tender pills or skins, and are called in Latine, Poma, Figges are the biggest: for some of them are found to be as great as Peares. As touching the Sycomores of Egypt and Cypres, and of their admirable fruit we haue written yuough in the treatise of forraigne Trees. The Idean Figs that come from the mountaine Ida, are of color red, of the bignesse of Oliues, only rounder they be, & in tast resemble Medlars. In the region about Troas neare to the said hill Ida, they call that fig-tree Alexandrina. It is as thicke as a mans arme about at the cubite or elbow, and full of branches: the wood thereof is tough and strong, howbeit, pliable to wind and bend which way a man would haue it. Void of milky substance it is, clad with a green barke, bearing leaues like the Tillet or Linden tree, but that they be soft. *Onesicritus* writes, that the Fig-trees in Hyrcania beare more pleasant fruit than ours in Italie, without all comparifon: also that they carrie a greater burden, and be farre more plentifull, inso-much, as one of them ordinarily yeelds 270 Modij of Figs. We haue here also in Italie many Fig-trees brought out of other forraigne countries, to wit, from Chalcis and Chios: wherof there be many sorts. For both our Lydian Figs which are of a reddish purple color, and also the Mammillane or teat-Figs, haue a resemblance of the said Chalcidian and Chian Figs, yea, and the Calistruthion Figs beyond others not a little, in goodnes of tast: and these of all the rest are the coldest. As touching the Affricane Figs, which many men preferre before all others, they hold the name of Affricke, as if it were their native countrey: and yet there is a great question thereabout, and I wot not well what to say thereof, considering that it is not long agoe that Affricke begun first to haue Fig-trees. For the Alexandrine Figs are of the blacke kind, hauing a white rift or chamfre, and are surnamed Delicate. The Rhodian Fig is likewise blacke of hue: and so is the Tiburtine, which also is of the hasty kind, and ripe before others.

Moreouer, there be certaine Figs which beare the names of those that brought them first into Italy: namely, the Liuian and Pompeian, and such are fittest to be dried in the Sun and so to be kept all the yeare long for a mans vse: like as the illfaouored, foolish and gaping Figs Mariscæ: as also those that are speckled with spots like the leaues of Laconian reeds.

There are besides the Herculean, Albicerate and Aratian white Figges, which of all other are most flat and broadest, and withall haue the least taile or Steele wherby they hang. The Porphyrite Figs first shew vpon the tree, and ordinarily be longest tailed. The smallest Figs called the popular Figs, which also are of all others the basest & of least account, come next after and beare the Porphyrites companie. Contrariwise, the Chelidonian Figges be the last: and ripen against Winter.

Moreouer, certain Figs there be which are both early, & also lateward: namely, such as beare twice a yeare: and be both blacke and white: for they are ripe first in haruest, and afterwards, in time of vintage. Late also it is before the Duracinæ be ripe, so called of the hard skin which they haue. Also some there be of the Chalcidian kind which beare thrice a yeare. At Tarentum there grow none but such as are exceeding sweet, and those they call Omas [or rather Oenadas, tasting of wine.]

Cato in his treatise of Figs writes thus, The vnfaourie Fig dotes, Mariscæ, would be sowne in an open, light, and chalkie ground. But the Affricane, Hirculane, and the Winter Saguntine Figges, as also the Telliane (which are blacke and long tailed) loue a fatter soile, or else well dunged.

After this, Figges haue changed into so many kinds, and altered their names very often: in such sort that by this point it is euident, how the world is altered, and to what varietie this life is subject. In some prouinces, as namely in Mœsia, there be winter Figs that hang all Winter long: but they come to be such, more by art and cunning, than naturally of themselves. For so soone as Autumne is passed, and Winter approches, they vse to couer with dung certaine little Fig-trees which they haue, and together with them the green yong Figs that they find on them in Winter: and when they haue continued so the sharpe time of dead Winter, so soone as the weather beginnes to be more warme and temperate, they discharge both fruit and tree of their dung: which being thus let out again (as it were) where they seemed buried, and now comming

M

Atolight, they no sooner find the fresh aire, & another kind of nourishment differing from that, whereby they liued, but doe embrace and receive the comfort of the new Sun most greedily, as if they were new born and reuiued: in such sort, as that in Mœsia, notwithstanding it be a most cold region, ye shall haue the figs of these trees to ripen, when others begin to blossom, and by this means become early and hasty figs in another yeare.

Now forasmuch as we are fallen to mention the figs in Affricke, which were in so great request in the time of *Cato*, I am put in mind to speake somewhat of that notable opportunity and occasion which by the means of that fruit he took for to root out the Carthaginians, & rase their very city. For as he was a man who hated deadly that city, and was otherwise carefull to provide for the quiet and securitie of his posteritie, he gaue not ouer at every sitting of the Senat, to importune the Senators of Rome, and to cry out in their eares, That they would resolve and take order to destroy Carthage: and in very truth one day about the rest, he brought with him into the Senat house an early or hasty fig which came out of that country, and shewing it before all the lords of the Senat, I would demand of you (quoth he) how long agoe it is (as you think) since this fig was gathered from the tree? And when none of them could deny but that it was fresh, and new gotten: Lo (quoth he) my masters all, this I do you to wit, It is not yet full three daies past since this fig was gathered at Carthage: see how neere to the walls of our citie we haue a mortall enemy. Vpon which remonstrance of his, presently they concluded to begin the third and last Punick war, wherein Carthage was vtterly subuerted and ouerthrowne. Howbeit *Cato* suruiued nor the rasing and saccage of Carthage, for he died the yeare immediately following this resolution. But what shall we say of this man? whether was more admirable in this act, his prouident care and promptnesse of spirit; or the occasion presented by the sudden obiect of the fig? was the present resolution and forward expedition of the Senat, or the vehement earnestnesse of *Cato*, more effectuall to this enterprize? Certes, somewhat there is about all, & nothing in mine opinion more wonderful, that so great a signiory and state as Carthage, which had contended for the Empire of the world for the space of 120 yeres, and that with the great conquerours the Romanes, should thus be ruined and brought vtterly to nought, by occasion of one fig. A designe that neither the fields lost at Trebia and Thrasymenus, nor the disgrace receiued at the battell of Cannæ, wherein so many braue Romans lost their liues, and left their dead bodies on the ground to be interred, could effect: nay not the disdain that they took to see the Carthaginians incamped and fortified within 3 miles of Rome, ne yet the brauadoes of *Annibal* in person, riding before the gate Collina, euen to dare them, could euer bring to passe. See how *Cato* by the means of one poore fig, preuailed to bring and present the forces of Rome to the very walls of Carthage.

There is a fig tree called *Navia*, honoured with great reuerence, in the common Forum and publique place of iustice at Rome, euen where the solenne assemblies are held for election of Magistrats, neere to the Curia, vnder the old shops called *Veteres*: as if the gods had consecrated it for that purpose: neere (I say) it is to the Tribunal named *Puteal Libonis*, & there planted by *Actius Nauus* the Augur, where the sacred reliques of his miracle, to wit, the Rafter and the Whetstone, were solemnly interred: as if it came of the owne accord from the said Curia into the Comitium, and had not bin set by *Nauus*. This tree if it begin at any time to wither, there is another replanted by the priests, who that way are very carefull and ceremonious. But a greater respect is had of another in remembrance of the first fig tree named *Ruminalis* (as it were) the nurse of *Romulus* and *Remus*, the two yong princes fondlings, and founders also of the city of Rome: for that vnder it was found a she wolfe, giuing to those little babes the teat (in Latine called *Rumen*): and for a memoriall hereof there is a monument of brasse erected neere vnto it, representing that strange and wonderfull story. There grew also a third fig tree before the temple of *Saturne*, which in the yeare 260 after the foundation of the city of Rome, was taken away, at what time as a chappell was builded there by the Vestal nuns, and an expiatory sacrifice offered, for that it ouerthrew the image of *Sylvanus*. There is a tree of the same kind yet liuing, which came to grow of it self, no man knows how, in the midst of the Forum Romanum, and in that very place where was the deepe chinke and gaping of the ground, that menaced the ruine of the Roman empire; which fatall and portentuous gulfe the renowned knight *Curtius* filled vp with the best things that were to be found in the city, to wit, his Vertue and Piety incomparable, testified by a most braue & glorious death. In the very same place likewise there is

an

an Olive and a Vine, which came thither by as meere a chance, but afterwards well looked and trimmed by the whole people; for to enjoy the pleasure and shade thereof. And there also stood an altar, which afterward was taken away by occasion of the solemne shew of sword-fencers, which *Iulius Caesar* late Emperor, exhibited to do the people pleasure, which were the last that plaied their prizes, and fought at the sharp in the said Forum. To conclude, wonderfull it is to see, how the fruit of this tree maketh fast to ripe: a man would say that Nature therein sheweth all her skill and force to ripen figs altogether at once.

CHAP. XIX.

¶ Of the wilde Fig trees: and of caprification.

There is a kind of wild Fig trees, which the Latines call *Caprificus*, that neuer brings any fruit to maturitie; but that which it selfe hath nor, it procureth to others, and causeth them to ripen. For such is the interchangeable course & passage of causes in nature, that as this thing putrifieth, that ingendreth; and the corruption of one is the generation of another. By this it comes to passe, that the wild fig tree breedeth certaine flies or gnats within the fruit thereof: which wanting nourishment, and nor hauing to feed vpon in those figs, because they become rotten and putrified as they hang vpon the tree, they flie vnto the other kinde of gentle and tame fig-trees, where they settle vpon the figs, and greedily nibble thereupon, vntill they haue made way and pierced into them; and by that means let in at first the breath of the warme Sun, and that comfortable and vegetatiue aire besides that helpeth to ripen them. Soon after they suck vp and spend the milky humor which they find there, and which keeps the figs still as it were in their infancie, and hindreth their speedy and timely maturitie. True it is, that the figs in time would ripen of themselves by the power and benefit of Nature only: howbeit skilfull and industrious husbandmen take order alwaies to set these wild fig trees neere to the place where other fig trees grow, but with due regard of the winde side, that when the foresaid gnats breake forth and are ready to fly out, a blast of wind might carry them to the other. And hereupon came the deuise and inuention to bring whole swarms & casts of them, as they hang one to another, from other places, that they might settle vpon the figs to consume the raw moisture within. Now if the soile be lean and hungry, and the fig trees growing therupon exposed to the North wind, there is no such need of this help: for the figs will dry sufficiently of themselves, by reason as well of the situation of the place, as the cliffs and rifts in them, which will effect that which the gnats or flies about named might performe. The like effect is to be seen also where much dust is, namely, if a fig tree grow neere vnto a high-way much frequented and travelled by passengers. For the nature of dust is to dry and soke vp the superfluous moisture of the milke within figs. And therefore when they are thus dried, whether it be by the means of dust, or of the said flies feeding, which is called *Caprification*, they fall not from the tree so easily, by reason they are discharged of that liquid substance which maketh them both tender, and also ponderous, weighty, and brittle withall.

All figs ordinarily are tender and soft in handling. Those which be ripe haue small graines within them: their succulent substance besides, when they begin to ripen, is white like milke: but when they are perfectly ripe it is of the colour of hony. They will hang vpon the tree vntill they be old, and when they are aged, they yeeld a certain liquor which distilleth from them in manner of a gum, and then in the end become dry.

The better sort of figs haue this honor and priuiledge, to be kept in boxes and cases for the purpose: and chiefly those which come from the Isle *Ebusus*, which of all others are the very best and largest: yea, and next to them those that grow in the *Marrucines* country. But where they are in more plenty they put them vp in great vessels called *Orcæ*, as namely in *Asia*: also in barrels & pipes, as at *Ruspina* a city in *Barbary*. And in very truth, the people of those countries make that vse of them when they be very dry, that they serue both for bread and meat. For *Cato* setting downe an order for dyet and victuals fit and sufficient for labourers, ordained, that they should be cut short of their other pittance, when figs are ripe, and make vp their full meals with it. And it is not long since the manner came vp to eat fresh new figs with salt and powdered meats, in stead of chiefe. And for to be eaten in this sort, the figs called *Coctana* (whereof we haue written before) and the dried figges *Caricæ* are commended: as also the *Cauncæ*, which

A which when *M. Crassus* should imbarque in that expedition against the Parthians (wherein he was slain) presaged ill fortune, and warned him not to go forward: namely, when at the very instant that he was ready to set foot a ship-board, there was a fellow heard to cry those figs for to be sold, pronouncing aloud, *Cauncæ, Cauncæ*: which word in short speaking was all one with *Cave ne eas* [i. Beware of this voiage, and go it not.] All these sorts of figges *L. Vitellius* brought out of *Syria*, into his ferm or manor that he had neere *Alba*, hauing *L. Gouvernor* or *Lientenant* generall in those parts, namely, in the later end of *Tiberius Caesar* the Emperor: and the same *Vitellius* was afterward Censor at Rome.

CHAP. XX.

¶ Of Medlars: three kinds of them.

Medlars and Seruices may well and truly be ranged in the ranke of Apples and Peares: Medlars be of three sorts; namely, *Anthedon*, *Serania*, and the third which they call *Gallicum*, [i. the French Medlar] which is of a bastard nature, yet it resembles the *Anthedon* rather than the other. As for the *Setanian* Medlar, the fruit is greater and whiter than the rest; also the kernels or stones within are of a more soft substance, and not altogether so woody and hard. The rest are smaller than these *Setania* or common Medlars, but they haue a better smell and more odoriferous, and withall will last longer. The tree it selfe that beareth Medlars is reckoned among the greatest sort: the leaues before they fall wax red: the roots be many in number, and run downe right deep into the ground: by which means, vnneth or verie hardly they be quite rooted vp. This tree was not known in Italy by *Cato's* dayes.

CHAP. XXI.

¶ Of Seruices, foure kinds.

OF Seruices there be foure sundry sorts, differing one from another: for some of them are round like apples, others pointed at the end as Peares; a third kinde are fashioned like eggs, as some long or tankard apples: and these are apt to be soon foure. For sweet sent and pleasant tast the round excell all others: the rest haue a relish of wine. The best kinde of them are they that haue soft & tender leaues about their steles whereby they hang. The fourth sort they call *Torminale*, allowed onely for the remedie that they afford to mitigate the torments and wringing of the colique. This tree is neuer without fruit, howbeit the smallest of all the rest, and differeth from the other, for it beareth leaues very like to the Plane. There are none of them that beare fruit before they be three yeares old. Lastly, *Cato* would haue Seruices to be preferred and condite in Cuit.

CHAP. XXII.

¶ Of the Wall-nut.

The next place to these for bignes, the Walnuts doe challenge, which they cannot claime for their credit and authoritie; and yet they are in some request among other licentious and wanton *Fescennine* ceremonies, at weddings: for lesse they be than Pine nuts, if a man consider the grossefne of the body outwardly; but in proportion therto they haue a much bigger kernel within. Moreover, Nature hath much graced and honoured these nuts with a peculiar gift she hath endued them with, namely, a double robe wherewith they are clad: the first is a tender and soft husk; the next, a hard and woody shel: which is the cause that at mariages they serue for religious ceremonies, resembling the manifold tunicles and membranes wherein the infant is lapped and enfolded within the womb: and this reason foundeth more probable, than that they should be scattered, because in their fall they rebound and make a ratling [to drowne (forsooth) all other noises from the bride-bed or chamber.] That these Nuts also were brought out of *Persia* first by commandement of the Kings, is euident by their Greeke names; for the best kind of them, they call *Persicon*, and *Basilicon*; as one would say, the Persian and Royall nut: and these indeed were the first names. Afterwards, the nut came to be named *Caryon*, (by all mens confession) for the heauinesse of head which it causeth, by reason of the

Q 9

strong

strong smell. Their outward husk serues to die wooll: and the little nuts when they come new forth are good to giue the haire of the head a reddish or yellow colour. The experiment thereof was first found by staining folks hands as they handled them. The elder that nuts be & longer kept, the more oleous and fatty they are. The only difference in the sundry kinds consisteth in the shell, for that in some it is tender and brittle, in others hard; in one sort it is thin, in another thick: lastly, some haue smooth and plain shells, others again be as full of holes and cranies.

Walnuts be the fruit alone that Nature hath inclosed with a couer parted in twaine, and so is ioyned and set together; for the shell is diuided and cleft iust in the middle, and each halfe resembleth a little boat. The kernell within is distinguished into foure parts, and between euery of them there runneth a membrane or skin of a woody substance. As for other nuts, their meat is solid and compact, as we may see in Filberds and Hazels, which also are a kind of nuts, and were called heretofore Abellinae, of their native place, from whence came good ones at first. They came out of Pontus into Narolia and Greece, and therefore they be called Pontick nuts. These Filberds likewise are covered with a soft bearded huske, and as well the shell as the kernell is round and solid, all of one entire piece. These nuts also are parched for to be eaten, and within their belly they haue in the mids a little chit or spirt as if it were a nauill.

As for Almonds, they are of the nature of nuts, and are reckoned in a third ranke. An vpper husk they haue like as Walnuts, but it is thin: like as also a second couerture of a shell. The kernell differeth somewhat, for broader it is and flatter, and their skin more hard, more sharpe, and hotter in taste than that of other nuts. Now whether the Almond tree were in Italy during the life of *Cato*, there is some doubt and question made; because he nameth the Greeke nuts, which some do hold for a kind of walnut. Mention maketh he besides of the Hazel nuts or filberds, as well the * *Galbae*, as the *Preneftine*, commended by him aboue all others, which hee saith are put vp in pots, and kept fresh and green within the earth. Now adaies the Thasian and Albeusian nuts be in great account; and two sorts besides of the Tarentine; whereof the one hath a tender and brittle shell, the other as hard: and those are the biggest of all other, and nothing round. He speaketh also of the soft shaled Filberds *Mollusca*, the kernels whereof doe swell and caufe their shells to breake in sunder.

But to return again to our Walnuts: some to honor them interpret their names *Iuglandes*, as a man would say, the nuts of *Iupiter*. It is not long since I heard a knight of Rome, a gentleman of high calling, and who had bin Consul, professe and say, that he had certain walnut trees that bare twice a yeare. As for Fifticks we haue spoken already of them. To conclude, these kind of nuts the aboue named *Pitellius* brought first into Italy at the same time, namely, a little before the death of *Tiberius* the Emperor: and withall, *Flaccus Pompeius* a knight of Rome, who serued in the wars together with him, caried them ouer into Spain.

CHAP. XXIII.

¶ Of Chestnuts eight kinds.

WE entitle Chestens also by the name of Nuts, although indeed they are more aptly to be called a kind of Mast. This fruit what euer it be is inclosed within a huske, and the same defended and armed all ouer with a rampier and palisade (as it were) of sharp prickles like the skin of an vchin; whereas the Acorn and other Mast is but half covered, and that defence in them is begun only. And certes, a wonderfull matter it is that we set so little store by this fruit, which Nature is so carefull to hide and defend. Vnder one of these husks ye shall find sometime three Chestnuts, and those hauing certain tough pills or shells very pliable. But the skin or filme within, and which is next to the body or substance of the fruit, vlesse it be pilled off and taken away, marreth the taste of it, like as it doth also in other nut-kernels. Chestnuts if they be roasted are better and more pleasant meat than otherwise. They vse also to grind them to meale, and thereof is made a kind of bread, which poore women for hunger will eat. The first Chestnuts were known to grow about Sardis, & from thence were brought, wherefore the Greeks call them Sardinian nuts: but afterwards they came to be named *Alie Banaia*, [*i. Jupiters* nuts] when as men began to graffe them; for thereby they became more excellent. And this day there be many sorts of them. The Tarentine be gentle and not hard of digestion, and in forme flat and plaine. That which they call *Balanitis*, is rounder, it will soone be pilled and

cleansed,

cleansed, and of it selfe will leape out of the skin. And of this kind, the *Salarian* is more neat, flat, and smooth: the Tarentine not so easie to be handled and dealt withall: the *Corellian* is more commended than the rest; as also the *Meterane*, which commeth of it by graffing: the manner whereof we will shew when we come to treat of graffes. These haue a red pilling, in which regard they are preferred before either the three cornered, or the blacke common ones, which be also called *Coctiua*, [*i. Chestnuts* to be boiled.] The best Chestnuts are they which grow about Tarentum, and Naples in Campaine. All the rest are good in manner for nothing but to feed swine, * so close sticketh the pill or inner skin in also, as if it were sodered to the kernell within, and so hard it is to separate the one from the other.

* *Scrupulosa corticis interioris circa nucleos quoque fermentatione.*

CHAP. XXIII.

¶ Of Carobes: of fleshie and pulpous fruits: of Mulberries: of liquid kernels or graines, and of berries.

THe fruit called Carobes or Caracts, may seeme to come neare vnto the foresaid Chestnuts, (so passing sweet they be) but that their cods also are good to be eaten. They be as long as a mans finger, and otherwhiles hooked like a faulcheon, and an inch in bredth. As for mast, it cannot be reckoned among fruit properly called Poma, and therefore we will speake of them apart, according to their nature.

Now are we to treat of the rest which are of a carnosus substance: and those are diuided into fruits that be soft and pulpous, and into berries. The carnosity in Grapes and Raisons, in Mulberries, and the fruit of the Arbut tree, differs one from the other. Againe, the fleshy substance in Grapes between the skin and the liquid juice, is one, and that in Sebesten is another. Berries haue a carnosity by themselves, as namely Oliues. Mulberries yeeld a juice or liquor within the pulpe thereof, resembling wine. They be ordinarily of three colours: at the beginning, white; soone after, red; and when they be ripe, blacke. The Mulberrie tree bloometh with the last, but the fruit ripeneth with the first. Mulberries when they be full ripe, staîne a mans hand with the juice thereof, and make them blacke: but contrariwise being vnripe, they scoure them cleane. There is not a tree againe, wherein the wit of man hath bin so little inuentiue, either to deuise names for them, or to graff them, or otherwise, saue only to make the fruit fair and great. There is a difference which we at Rome doe make, betweene the Mulberries of *Ostia* and *Tusculum*. There is a kind of Mulberries growing vpon the bramble, but their skin is much harder than the other. Like as the ground-strawberries differ in carnositie from the fruit of the Arbut tree, and yet it is held for a kind of Strawberry, even as the tree it selfe is reamed the Strawberry tree. And there is not a fruit of any other tree, that resembleth the fruit of an hearb growing by the ground, but it.

The Arbut tree it selfe spreadeth full of branches: the fruit is a whole yeare in ripening; by which means a man shall find alwaies vpon the tree, yong and old fruit together one vnder another; and the new euermore thrusts out the old. Whether it be the male or female that is barren, writers are not agreed. Surely the fruit is of base and no reckoning at all: no mariuell therefore if the Latines gaue it the name *Vnedo*, for that one of them is enough to be eaten at once. And yet the Greeks haue two names for it, to wit, *Comarum* & *Memecylon*: whereby it appeareth, that there be as many kinds among the Latines also, although it be reamed by another name, *Arbutus*. *K. Julia* saith, that these trees in Arabia grow to the heighth of fiftie cubites.

As touching Graines and liquid Kernels, there is great difference betweene them: for first and formost, among very grapes, there is no small diuersitie in the skin, either for tendernes or thickness: in the inner stones or pepins, which in some grapes are but single, or one alone; in others double, and those commonly yeeld not so much wine as the others do. Secondly, those of Iuie and Elder differ very much, yea and the graines within a Pomegranat are not like to others in their forme, for they alone be made cornered and angle-wise; and seuerall as they bee, they haue not a particular skin of their own, but they are altogether clad within on, which is white: and yet they stand all wholly of liquor and pulpous carnositie, especially those which haue within them but a small stone or woodie kernell.

Sensibly, there is as much varietie in berries: for oliues differ much from Bay berries: likewise those of a Lote tree are diuers from them which the Cornel tree beares. The Myrtle also differeth

differeth from the Lentisk in the verie berrie. As for the huluer or hollie berries, and the hawes of the white-thorn, they are without any juice or liquor: whereas Cherries be of a middle kind, betwene berries and graines. This fruit is white at the first, as lightly all berries be whatsoeuer: but afterwards some waxe greene, as Oliues and Baies; others turn red, as Mulberries, Cherries, and Cornoilles; but in the end they all become blacke, as Mulberries, Cherries, and Oliues.

CHAP. XXV.

¶ Of Cherries, eight kinds.

BEfore the time that *L. Lucullus* defeated *K. Mithridates*, there were no cherrie-trees in Italy: but after that victorie (which was about the 680 yeare from the foundation of the citie of Rome) he was the man that brought them first out of Pontus, and furnished Italie to well with them, that within fixe and twentie yeres, other lands had part thereof, even as far as Britain beyond the ocean. Howbeit (as we haue before said) they could neuer be brought to grow in *Aegypt*, for all the care and industrie employed about them. Of Cherries, the reddest fruit bee called *Apronia*; the blackest, *Actia*; the *Cæcilian* be round withall. The *Iulian* Cherries haue a pleasant tast, but they must be taken new from the tree and presently eaten; for so tender they be otherwise, that they will not abide the carriage. Of all other, the *Duracine* Cherries be the foueraign, which in *Campaine* are called *Pliniane*. But in *Picardie*, and those low countries of *Belgica*, they make most account of the *Portugall* Cherries: as they do also who inhabite vpon the riuer *Rhene*. They haue a hew with them composed of three colors, between red, black and green, and alwaies look as if they were in ripening still. It is not yet full 5 yeres since the Cherries which they call *Laurea*, were known: so called they be, because they were grafted on a Bay-tree stocke, and thereof thy take a kind of bitterness, but yet not vnpleasant to the tast. There be moreouer *Macedonian* Cherries, growing vpon a small tree feldome about three cubits high: and yet there be certain dwarfe Cherries not full so tall, called *Chamecerasti*, [*i. ground cherrry-shrubs.*] The Cherry-tree is one of the first that yeelds fruit to his master, in token of thankfulness & recognisance of his paines all the yeare long. It delights to grow in cold places and exposed to the North. The Cherrie wil drie in the sun, and may be kept in barrells like Oliues.

CHAP. XXVI.

¶ Of the Corneile and Lentiske tree.

THe same care is had in conditing the berries of the Corneil and the Lentiske, as in preserving Oliues: so curious are men to content their tooth, as if all things were made to serue the belly. Thus we see, how things of diuers relishes are mingled together, and one giues a tast vnto another, and causeth to be pleasant at the tongues end. Nay we entermingle all climats and coasts of heauen and earth to satisfie our appetite: for to one kind of meat wee must haue drugs & spices fetcht as far as from *India*: to another, out of *Aegypt*, *Candie*, and *Cyrene*: and in one word, for euery dish we haue a feuerall land to find vs sawce. To conclude, wee are growne to this passe, that we cease not to sophisticate our viands, euen with hurtfull things, so they tast well: yea and to make dishes of very * poisons, because we would deuoure and send all downe the throat. But more plainly hereof, in our professed discourse of the nature and vertue of Hearbs.

CHAP. XXVII.

¶ The diuersitie of tastes and saours.

IN the meane time, as touching those things which are common as well to all fruit, as juices and liquors: first and formost we find of tastes 13 feuerall kinds; to wit, sweet, pleasant, fattie, bitter, harsh and vnpleasant, hot and burning at the tongues end, sharpe and biting, tart or stringent, fowre, and salt.ouer and besides all these, there be three others of a most strange and wonderfull nature. The first is that, wherein a man may haue a smacke of many tastes together, as in wines: for in them a man shall find an harsh, sharpe, sweet, and pleasant relish all at once; and yet these all differ from the natie verdure of wine. A second sort there is besides, which carries a strange & different tast verily from the thing it self, and yet it hath besides the proper and peculiar

Aculiar tast of the owne substance, as the Myrtle: for it carrieth a feuerall tast by it selfe, proceeding from a certaine kind, mild, and gentle nature, which cannot truly be called either sweet, fattie, or pleasant, if we would speake precisely. Last of all, water hath no tast at all of any juice or liquor whatsoeuer, and yet therein is a flat tast by it selfe, which is called waterish, that nothing else besides hath: for if a man do tast in water a relish of any sap or liquor, it is reputed for a bad and naughtie water.

Furthermore, a great and principall matter of all these tastes, lyeth in the saueur and smell, which is connaturall vnto the tast, and hath a great affinitie with it: and yet in water, is neither one or other to be perceiued: or if any be felt either by tongue or nose, it is faultie, that is certaine. Finally, a wonderfull thing it is to consider, that the three principall Elements whereof the world is made, namely, Water, Aire, and Fire, should haue no tast, no saueur, nor participation of any sap and liquor at all.

CHAP. XXVIII.

¶ The iuice and sap of Fruits and Trees: their colours and odours: the nature of Apples, and such soft Fruits: and the singular commendation of all Fruits.

TO begin withall, The Pear, The Mulberry, & the Myrtle-berrie, haue a juice or sap within them, resembling wine, * no maruell then, of Grapes, if they haue the like. Oliues, Bay-berries, Walnuts and Almonds, haue a fattie liquor in them. The Grape, the Fig, and the Date, carie a sweet juice with them. Plums haue a waterish tast.

There is no small difference in the colour also that the iuice of fruits do beare: Mulberries, Cherries, and Cornoilles, haue a sanguine and bloudie liquor: so haue the blacke grapes; but that of the white grapes, is likewise white. The juice of Figs toward the head or neck of the fruit, is white like milke; but of another color in all the bodie besides. In Apples, it is in manner of a froth or foam: in Peaches, of no colour; and yet the *Duracina* of that kind, be full of liquor, but who was euer able to say, what colour it was of?

The odor and saueur likewise of fruits, is as strange and admirable: for the smell of Apples is sharpe and piercing; of Peaches, weake and waterish. As for sweet fruits, they haue none at all: D for verily we see, that sweet wines likewise haue little or no smell, whereas the small and thin are more odoriferous: and all things in like manner of a subtil substance, do affect the nostrills more, than the thicke and grosser doe: for whatsoeuer is sweet in sent, is not by and by pleasant and delicate in tast; for sent and smacke are not alwaies of like sort: which is the reason that *Pomecitrons* haue a most piercing and quick saueur, whereas in relish they are rough and harsh: and so it fares in some sort with Quinces. As for Figs, they haue not any odor. And thus much may suffice in generall, for the sundrie kinds and sorts of fruits which are to be eaten, it remaineth now to search more narrowly into their nature.

To begin then with those that are enclosed within cods or husks: ye shal haue some of these cods to be sweet, and the fruit or seed contained within, bitter, and contrariwise, many of those E graines or seeds are pleasant and toothsome enough; but eaten with the huskes, they be starke naught and loathsome.

As touching berries, there be that haue their stone or wooddie substance within, and the fleshy pulp without, as Oliues, and Cherries: and there be again, that within the said woody stone haue the carnositie of the berry as some fruits in *Aegypt*, whereof we haue already written. As for berries carnos without forth, & pulpos fruit called Apples, they be of one nature. Some haue their meat within, & their woodie substance without, as nuts: others, their carnosity without, and their stone within, as Peaches and Plums. So that in them we may say, That the faultie superfluitie is enuironed with the good fruit, whereas fruit otherwise is ordinarily defended by the said imperfection of the shell. Walnuts and Filberds are enclosed with a shell: Chestnuts be contained vnder a tough rind, that must be pulled off before they be eaten; whereas in Medlars, the carnositie and it be eaten together. Acornes, and all sorts of mast, be clad with a crust; Grapes with a skin, Pomegranats with a rind and a thin pannicle or skin besides. Mulberries do consist of a fleshy substance and a liquor. Cherries, of a skin and a liquid juice. Some fruits there be, the substance whereof will soon part from their woodie shell without, or stone within,

as nuts and Dates: others sticke close and fast thereto, as Oliues and Bay berries. And there be againe that participate the nature of both, as Peaches: for in those that be called Duracina, the carnos substance cleaueth hard to the stone, so as it cannot be plucked from it, whereas in the rest, it commeth easily away. Now ye shall meet with some fruits, that neither without in shell, nor within-forth in kernell, haue any of this woodinesse, as a kind of Dates [named Spadones.] And there be againe whose very kernell and wood is taken for the fruit it selfe, and so vied; as a kind of Almonds, which (as we said) doe grow in Egypt. Moreouer, yee shall haue a kind of fruits furnished with a double superfluity of excrement to couer them without-forth, as Chestnuts, Almonds, and Walnutts. Some fruits haue a substance of a threefold nature, to wit a bodie without; then a stone or wood vnder it; and within the same, a kernell or seed, as Peaches. Some fruits grow thick and clustred together vpon the tree, as Grapes, and likewise Scruifes, which claspe about the branches and boughes, bearing and weighing them downe as well as grapes. Others for it, hang here and there very thin, as Peaches. And there be againe that lye close, contained (as it were) within a wombe or matrice, as the kernells of the Pomegranates. Some hang by smal steles or tailes, as Peares: others in bunches, as Grapes and Dates. Ye shall haue some fruit grow by clusters, and yet hang by a long taile, as the Berries of Iuie and Elder: and others againe cleaue fast to the branch of the tree, as Bay berries: some both waies, as Oliues, for there bee of them that haue long steles, and others againe short tailed. Some fruits there be also, that are formed like cups or mazers, as Pomegranats, Medlars, the Egyptian bean or Lore, and that which groweth about the riuer Euphrates.

As for the singularities and commendable parts in fruits, they be of diuers sorts, Dates are most set by for their fleshie substance, and yet they of Thebes aboue in high Egypt, are esteemed onely for their outward coat or crust that they haue. Grapes, and the Dates called Caryotes, are in great account and estimation for their iuice and liquor: Peares and Apples be most accepted for their callous substance next vnto their skin or paring, but the honey-apples Melimela, are liked for their carnositie and fleshie pulpe within: Mulberries content the tast with their gristle or cartilage substance: and the best part of the nut, is the very graine of the kernell. In Egypt, some fruits are regarded onely for their vtmost skin, as drie Figs: when Figges bee green, the same is pilled off and cast aside like a shell, but be they once drie, the said skin is passing good. In all kind of Papyr-reeds, Ferula plants, and the white thistle Bedegnar, the verie maine stemme is the fruit to be eaten. The shoots also and tender sprigs of the Fig-tree, are reputed for good meat, and also medicinable. To come vnto the shrubs kind, the fruit of Capres is eaten together with the stalke. As for Carobe, what is it else but a meere woodie substance that folke do eat: (and yet the seed and graines within them, are not altogether to be despised for the propertie that they haue) although to speak precisely, it cannot properly be called either flesh, wood, or gristle; neither hath it found any other conuenient name to be termed by.

CHAP. XXIX.

Of the Myrtle, cleuen kinds thereof.

Nature hath shewed her wonderful power and bounty, especially in the iuice of the Myrtle, considering that of all fruits, it alone doth yeeld two sorts both of oile and wine: likewise the mixture or composition called Myrtidanum, as we haue said before. Also there was another vse in old time of Myrtle berries: for, before that Pepper was found and vsed as it is, they serued in stead thereof: from whence tooke name that exquisite and daintie dish of meat, which euen at this daie is called Myrtatum. And hereof came that excellent sauce so highly commended for the brawne of the wild Bore, when for the most part Myrtle berries are put thereto to dip the meat therein, for to giue a better tast to that kind of venison.

As for the very tree it selfe, the first that euer was seen within the compasse and precincts of Europe (which beginneth at the mountaine Ceraunia) was about Circeij, where stood the tombe sometimes of *Elpenor*; and still it retains the Greeke name: whereby we may well judge, that it is a stranger. Howbeit there grew a Myrtle tree in old time, when Rome was first founded, euen in that plot of ground where the citie now standeth. For thus goeth the historie: That vpon a time the Romanes and Sabines being raunged in battaile array, and at the point

A to fight a field, and to try the quarell (for the wrong which the Sabines pretended, was done to them, in regard that the Romans had rauished their daughters being yong maidens) were reconciled and made friends: and thereupon laid downe their armes and weapons, and were there purified with the sacred branches of Myrtle, in that very place wherein now the temple & image of *Venus Cloacina* standeth: which therupon tooke the name (for that *Cloere* in old Latin, signified to purge or cleanse.) Besides, that tree otherwise doth afford a kind of sweet perfume to be burned. Now was this tree chosen for that purpose then to make attonement and to ratifie the marriage betwene the Romans and the Sabine Virgins, because *Venus* is the president and mother of carnall copulation, and the parronesse withall of the Myrtle tree. I will not confidently auouch, but me thinks I may presume to say, that the Myrtle was of all other trees first planted

B in the publick places of Rome for some memorable preface and fore-tokening of future euent and things to come. For whereas the temple of *Quirinus* (i. of *K. Romulus*) is reputed for one of the most antique buildings now extant, there grew euen before it for a long time two old and sacred Myrtle trees: the one named *Patritia* (i. the Myrtle of the Nobility: and the other *Plebeia*; that is to say, the Myrtle of the Comminalty. The *Patritian* prospered and flourished many yeares together, whiles the *Plebeian* began to fade and wither. And to say a truth, so long as the Senate was able to maintaine and vphold their authority, the Myrtle of the Nobles continued fresh and greene, and spread her boughes at large; whereas that other of the Commons seemed as it had beene blasted, dried, and halfe dead: but after that the state of the Senat began to quaille and droupe (which was about the time of the war with the *Marfyans*) as their tree decayed and wasted, so the *Plebeians* Myrtle held vp the head againe: and so by little and little, as the Maiesty of the Senatours was taken downe and abated to nothing, so their Myrtle waxed poore and barren vntill it became dry and stark dead. Moreouer, there stood an old chappel and an altar consecrated to *Venus Myrtea*, whom now at this day they call *Murtia*.

Cato in his time wrote of three kinds of Myrtle: to wit, the white, the blacke, and the Conjugula (so called haply of wedlock or mariage): & peraduenture it may come of the race of those Myrtles belonging to *Venus Cloacina* aboue named. Howbeit, in these daies wee distinguish our Myrtles otherwise; for some we repute wild and sauage, others tame and gentle: and these both are likewise of two sorts, to wit, either broader or narrower leaued. To the wilde kind properly belongeth the prickie Myrtle *Oximyrsine*. As for the tame and gentle Myrtles, they be those that are planted in hort-yards and gardens, wherewith gardeners make arbours, knots, and diuers deuises. Whereof be sundry kindes. The *Tarentine* with small leaues; ours of Italy with broader; and the Myrtle * *Hexastica*, which is very full of leaues, and ordinarily each branch hath six rankes thereof. But these are altogether out of request: both the other are full of boughes and branches. As touching the aboue named *Conjugula*, I suppose it be the same that our common Myrtle here in Italy. But the most odoriferous Myrtle of all others, is that which groweth in Egypt.

Now concerning the wine of Myrtles, *Cato* hath shewed vs the manner how to make it: namely, to take the black Myrtle berries, to dry them in the shade vntill they haue lost all their waterish humidity, & so to put them in Must or new wine, & let them lie there infused, or in sleep. E For certainly, if the berries be not dried before, they would yeeld an oile from them. Howbeit, afterward there was a deuise found out to make a white wine of the white Myrtle in this manner. Take of Myrtles wel beaten or stamped, the quantity of two * Sextares, steep the same in three hemires or pintes of wine, and then straine and presse forth the liquor.

Moreouer, the very leaues of the Myrtle tree, being dried and reduced into a kinde of meale, are singular good for to cure the vlcers in mens bodies: for certaine it is, that this powder doth gently eat away and consume the superfluous humours that cause putrifaction. And besides, it serueth well to coole and repress immoderate sweats.ouer and besides, the Oile also of Myrtles (a strange and wonderfull thing to tell) hath a certaine relish and taste of wine: and withall, the fat liquor thereof is indued with a speciall and principall vertue to correct and clarify Wines; if the bagges and strainers where-through the wine runneth, bee first sooked and F drenched therewith: for the said oleous substance retaineth and keepeh with it all the lees and dregges, and suffereth nothing but the pure and cleare liquor to passe through, and more than that, it carrieth with it the commendable odour and principall vertue of the said oile. Furthermore, it is said, That if a wayfaring man that hath a great journey for to goe on foot, carrie

in his hand a stick or rod of the Myrtle tree, he shall neuer be weary, nor thinke his way long and tedious. Also *rings made of Myrtle twigs, without any edged iron tooles, keep downe and cure the swelling bunch that riseth in the groine. What should I say more? The myrtle intermedleth in war affaires: for *Posthumus Tubertus*, being Confull of Rome (who was the first that entred in a petty triumph, ouant into the city, because he had easily conquered the Sabines, and drawne in manner no bloud of them) rode triumphant in this manner, to wit, crowned with a chaplet of Myrtle, dedicated to *Venus Victorese*; and from that time forward the Sabines (euen his very enemies) let much store by that tree, and held it in great reuerence. And euer after, they that went but ouant into the city after a victory, ware this kind of garland only, except *M. Crassus*, who after he had vanquished the fugitiue slaues, and defeated *Spartanus*, marched in a coronet of Lawrell. *Masurius* writeth, how Generals when they entred triumphant into Rome, riding in their stately chariots (which was the greatest honor of all others) ware vpon their heads, chaplets of Myrtle. *L. Piso* reporteth, That *Papyrius Maso* (who first triumphed in mouht Albanus ouer the Corsians) vsed euer after to come vnto the games Circenses, and to behold them, crowned with a garland of myrtle. This *Papyrius* was grandfather by the mothers side, to the second *Scipio Africanus*. Finally, *M. Valerius*, according to a vow that he made in his triumphs, vsed to weare coronets as well of Lawrell as Myrtle.

CHAP. XXX.

¶ Of the Lawrell or Bay tree, thirteene kinds thereof.

Lawrell is appropriate vnto triumphs, and besides groweth most pleasantly before the gates of the Emperors court, and bishops pallace, giuing attendance there as a dutifull portresse or huißer, most decently. This tree alone both adorneth their stately houses, & also keepes watch and ward duly at the dores. *Cato* setteth down two kinds of Lawrell, to wit, the Delphick, and the Cyprian. Hereunto *Pompeius Lenaus* hath ioined a third, which he called Mustacea; because in old time they vsed to lay the leaues thereof vnder certain cakes or March-panes (which in those daies they called Mustacea) as they were in baking; this third kind hath leaues of all others largest, flaggy, hanging, and whitish withall. As for the Delphick, it carrieth leaues of one entire colour, greener than the rest; the baies or berries thereof likewise are biggest, and of a reddish green colour. With this Lawrell were they wont to be crowned at Delphos, who won the prize at any tourney or solemne game; as also the victorious captains who triumphed in Rome. The Cyprian Lawrell hath a short leafe, black, crisped, or curled, and about the sides or edges thereof it turneth vp hollow like a gutter or crest-tile. Howbeit, afterwards there were ranged in the rank of Lawrells other trees, to wit, the *Tinus*, which some take to be the wild Lawrell, others say it is a kind of tree by it self indeed, it differeth from other Lawrells in the colour of the fruit; for it beareth blew berries. Then came the roiall Lawrell in place, which began to be called Augusta or Imperial. This is a very tall and big tree, with leaues also as large in proportion, and the Baies or berries that it beareth are nothing sharp biting and vnpleasant in tast. But some there be that thinke this roiall Bay, is not a Lawrell, but a feuerall tree apart, as hauing longer & broader leaues than the rest of the ordinary sort. And these writers speaking of other kinds, call our common Bay tree, Baccalia, and namely that which is so fruitfull and beareth such a sort of berries: as for the fruitlesse and barren of that sort they name Triumphal, which is, as they say, vsed in triumphs. Whereat I maruell very much, vnlesse this ordinance and custome began of *Augustus Caesar*, by occasion of that Lawrell which came to him as sent from heauen (as I wil shew anon more at large;) and of all others it is for height lowest, in leafe short and frizled, very geason and hard to be found. Now there is another kind of Lawrell named *Taxa*, very fit for greene arbors, and to be wrought into knots. Out of the middest of the leafe there growes forth another little one, in manner of a skirt, tongue, or lappet of the leafe. Also without any such excreffence there is that, which they name *Spadonia*, as one would say, the gueldest Bay, that cares not how shadowie the place be where it grows: for be it neuer so remote out of the Sun, or ouershadowed how soeuer, yet it ceases not to grow & ouerspread the ground where it standeth. Moreover, in this rank is to be reckoned the wild shrub called Lowrier or *Chamaedaphne*. There is besides the Lawrell *Alexandrina*, which some call *Idra*, [i. Mountaine Lawrell] others *Hypoglossion*, [i. Horse tongue] some *Daphnitis*, others *Carpophyllon* or *Hypelate*. This plant putteth forth branches

A branches immediatly from the root, of a span or nine inches long: very proper and hand som to draw workes, or to clad arbors withall in a garden, also to make garlands and chaplets. The leaues are more sharp and pointed, softer also and whiter than those of the Myrtle, yea, & haue within them a bigger grain or seed, of colour red. Great plenty thereof groweth vpon the mountaine *Ida*, likewise about *Heraclea* in *Pontus*; and in oneword, neuer but in hilly and mountain countries.

As for the herb *Daphnoeides* or *Laureola*, it hath many names: for some terme it *Pelasgum*, others *Eupetalon*, and there are again who would haue it to be *Stephanos Alexandri* (i. *Alexanders* chaplet.) This plant also is full of branches, carrying a thicker and softer leafe than the common Lawrell; and if a man tast thereof, it will set both the mouth & also the throat on a fire: the berries that it beareth be blackish, inclining to a kind of red. It hath bin noted and obserued in ancient writers, that no kind of Lawrell in old time was to be found in the Island *Corfica*; and yet in these daies it is there planted, and thriueth well enough. The Lawrell betokeneth peace: insomuch, as if a branch thereof be held out among armed enemies, it is a signe of quietnes and cessation from armes. Moreover, the Romans were wont to send their missiue letters adorned with Lawrell, when they would giue aduertisement of some special good newes or iouful victory: they vsed besides to garnish therewith their lances, pikes, and spears. The knitches also and bunches of rods, born before grand captains and generals of the army, were beautified & set out with Bay branches. Herewith they stick and bedecke the bosome of that most great and gracious *Iupiter*, so often as there cometh glad tidings of some late & fresh victory. And all this honor is don to the Lawrell, not because it is alwaies green, nor for that it pretendeth and sheweth peace (for in both these respects the oliue is to be preferred before it) but in this regard, that the fairest and goodliest of them grow vpon the mountaine *Pernassus*; and therefore also is it so acceptable to *Apollo*, for which cause (as may appeare by *L. Brutus*) the Roman kings in old time were accustomed to send great presents and oblations thither to the temple of *Apollo*; or peraduenture it was in memoriall of that ground that bare Lawrell trees, and which according to the Oracle of *Apollo*, the said *L. Brutus* kissed, when he intended the publicke freedom of the city, and minded to deliuer it from the yoke and seruitude of the kings: or haply, because it alone either set with the hand before the dores, or brought into the house, is not blasted and smitten with lightning. And these reasons verily inducement to beleuee, that in times past they chose the Bay tree for their triumphs, before any other: rather than as *Masurius* would haue it, because the Lawrell serued for a solemne perfume, to expiate and assoile the carnage and execution don vpon the enemies. And so far were men in old time from common vsing either Lawrell or oliue, and polluting the same in any prophane vse, that they could not be permitted to burne thereof vpon their altars when they sacrificed or offered Incense, although it were to doe honour to the gods, and to appease their wrath and indignation. Euident it is, that the Bay tree leaues, by their crackling that they make in the fire, do put it from them, and seem to detest and abhor it. It curerh moreover the diseases of the guts [the matrice and the bladder] also the lassitude and weariness of the sinews. It is reported, that *Tiberius Caesar* the Emperor vsed euer to weare a chaplet thereof when it thundered, for feare of being stricken with lightning.

E Moreover, certaine strange and memorable euents as touching the Bay tree, haue happened about *Augustus Caesar*. For *Liuita Drusilla* (who afterwards by marriage with the said *Augustus*, became Emperesse, and was honored with the title of *Augusta*) at what time as she was affianced and espoused to *Caesar*, chanced as the fat still, to haue an exceeding white hen to light into her lap (which an *Aegle* flying aloft, let fall from on high) without any harme at all to the said pullet. Now when this lady or princeesse aduised & considered wel the hen, without being astonished and amazed at so strange & miraculous a sight, she perceiued that the hen held in her bill a lawrell branch full of Bay berries. The *Wisards* and *Soothsaiers* were consulted withall about this wonderful occurrent, and gaue aduise in the end to preferue the bird and the brood thereof: likewise to set in the ground the foresaid branch, and duly to tend and look vnto it. Both the one and the other was done and executed accordingly, about a certain house in the country belonging to the *Caesars*, seated vpon the riuer *Tyberis*, nere the causey or port way *Flaminia*, about nine miles from Rome: which house therupon was called, *Ad Gallinas*, as a man would say, The signe of the Hens. Well, the foresaid branch mightily prospered, and proued afterwards to be a groue of Laurels, which all came from the first stock. In proceffe of time, *Augustus Caesar* when he

he entred in **T**riumph into Rome, caried in his hand a branch of that Bay tree, yea, and wore a chaplet vpon his head of the same: and so did all the Emperors and *Cæsars* his successors after him. Hereof also came the custome to set againe and replant those branches of Lawrel that emperors held in their hands when they triumphed; & therof continue whole woods & groues distinguished each one by their feuerall names, and perhaps therefore were they named **T**riumphall. This is the only tree known in the Latine tongue, whereof a man beareth the name. Again, there is not another tree besides that hath the leafe to cary in the Latine tongue a denomination and name by it selfe apart, as well as the tree: for whereas the plant is named *Laurus*, the leafe we call *Laurea*. Moreouer, there is a place likewise within the city of Rome on mount **A**ventine, retaining stil the name *Loretum*, which first was imposed vpon it by reason of a lawrell groue which grew there. The Bay tree also is vsed in solemne purifications before the gods: and to conclude, this would be resolued and agreed vpon by the way, That if a branch thereof be set, it will prosper and become a tree; although *Democritus* and *Theophrastus* make some doubt thereof. Thus much of Lawrels and other domesticall and natieue trees: it remaineth now to write of those that be wild and sauage, and of their natures.

THE SIXTEENTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIUS

SECVNDVS.

The Proeme.

Hitherto haue we treated of those Trees that beare Apples and such like fruits: which likewise with their mild iuice and sweet liquors made our meats first delighsome, and taught vs to mingle together with the necessarie food for sustentation of our lines, that which maketh it delicate and pleasant to content our taste: as well those trees that naturally were so in the beginning, as those which through the industry and skill of man, what by grafting and what by wedding them (as it were) to others, became toothsome, and delectable to our tongue: whereby also we haue gratified in some sort wild beasts, and done pleasure to the foules of the aire. It followeth now by order, that we should discourse likewise of trees that beare Mast: those trees (I say) which ministred the first food vnto our forefathers, and were the nources that fed and cherished mankind in that rude wild age and poore infancie of the world: but that I am forced to break the course of mine history, and preuented with a deep study and admiration arising from the truth and ground of experience, to consider, What maner of life it might be, to liue without any trees or shrubs at all growing out of the earth.

CHAP. I.

¶ Of Nations that haue no Trees nor Plants among them. Of wonderfull trees in the Northerly regions.

Ve haue shewed heretofore, that in the East parts verily toward the maine Ocean, there be many countries in that estate, to wit, altogether destitute of trees. In the North also I my selfe haue seene the people called * *Cauchi*, as well the greater as the lesse (for so they be distinguished) where there is no shew or mention at all of any tree whatsoeuer. For a mightie great compasse, their Country lieth so vnder the Ocean, and

*1. The Low countries of Zealand, &c.

A and subiect to the tide, that twice in a day & night by turns, the sea ouer floweth a mighty deale of ground when it is floud, and leaues all dry again at the ebbe & return of the water: inso much, as a man can hardly tell what to make of the outward face of the earth in those parts; so doubtfull it is between sea and land. The poore silly people that inhabit those parts, either keep together on such high hills as Nature hath afforded here and there in the plain: or els raise mounts with their own labor and handy work (like to *Tribunals* cast vp and reared with turf, in a camp) about the height of the sea, at any spring tide when the floud is highest; and thereupon they set their cabbins and cottages. Thus dwelling as they do, they seeme (when it is high water, & that all the plain is ouerspread with the sea round about) as if they were in little barks floating in the midst of the sea: againe, at a low water when the sea is gone, looke vpon them, you would take them for such as had suffered shipwracke, hauing their vessels cast away, and left lying aro-side amid the sands: for ye shall see the poore wretches fishing about their cottages, and following after the fishes as they go away with the water: they haue not a four-footed beast among them; neither enioy they any benefit of milk, as their neighbour nations do: nay, they are destitute of all means to chase wild beasts, and hunt for venison; in as much as there is neither tree nor bush to giue them harbor, nor any neare vnto them by a great way. Sea-weeds or *Reike*, rushes and reeds growing vpon the washes and meers, serue them to twist for cords to make their fishing nets with. These poore souls and silly creatures are faine to gather a slimy kinde of fatty mud or oase, with their very hands, which they drie against the wind rather than the Sun: and wish that earth, for want of other fuel, they make fire to seeth their meat (such as it is) and heat the inward parts of their body, ready to be starke and stiffe againe with the chilling North winde. No other drink haue they but rain water, which they saue in certain ditches after a shower, and those they dig at the very entry of their cottages. And yet see! this people (so wretched and miserable a case as they be in) if they were subdued at this day by the people of Rome, would say (and none sooner than they) that they liued in slauerie. But true it is, that Fortune spareth many men, to let them liue still in paine and misery. Thus much as touching want of woods and trees.

On the other side, as wonderfull it is to see the mighty Forrests at hand thereby, which ouerspread all the rest of Germany: and are so big, that they yeeld both cooling and shade to the whole countrey: yea, the very tallest woods of all the rest are a little way vp higher in the countrey, and not farre from the *Cauchi* aboue said: and especially those that grow about the two great loughes or lakes in that tract. Vpon the banks wherof, as also vpon the sea-coasts, there are to be seene thick rows of big Okes, that loue their seat passing wel, and thrue vpon it in growth exceeding much: which trees happening to be either vndermined by the waues and billowes of the sea vnder them, eating within their roots, or chased with tempestuous winds beating from aboue, carry away with them into the sea (in manner of Islands) a great part of the Continent, which their roots doe claspe and embrace: wherewith being counterpoised and ballasted, they stand vpright, floting and making saile (as it were) amid the waues, by the means of their mighty armes which serue in stead of tackling. And many a time verily, such Okes haue frighted our fleets and armadoes at sea, and especially in the night season, when as they seemed to come directly against their proes standing at anker, as if of purpose they were driuen vpon them by the waues of the sea: inso much, as the sailers & passengers within, hauing no other means to escape them, were put to their shifts, and forced for to addresse themselves, and range a nauall battell in order, and all against trees, as their very enemies.

CHAP. II.

¶ Of the huge and great Forrest *Hercynia*

IN the same North climat is the mighty Forrest *Hercynia*. A huge and large wood this is, stored with tall and big Okes, that neuer to this day were topt or lopt. It is supposed they haue beene euer since the creation of the world, and (in regard of their eternall immortality) summing all miracles besides whatsoeuer. And to let passe all other reports which happily would be thought incredible, this is knowne for certain, That the roots of the trees there, run and spread so far within the ground, that they encounter and meet one another: in which resistance they swell and rise vpward, yea, and raise vp mounts of earth with them to a good height in

in many places: or, where as the earth follows not, a man shal see the bare roots embowed arch-wise, and mounting aloft as high as the very boughes: which roots are so interlaced, or els rub one against the other, striuing (as it were) not to giue place, that they make a shew of great portails or gates standing open so wide, that a whole troupe or squadron of horsemen may ride vp-right vnder them in ordinance of battell.

CHAP. III.

¶ Of trees bearing Maſt.

MAſt trees they were all, for the most part, which the Romanes euer so highly honoured and held in best account.

CHAP. IV.

¶ Of the Ciuicke garland: and who were honoured with chaplets of Tree-leaues.

From Maſt trees (and the Oke especially) came the Ciuicke coronets. And in very truth, these were the most honorable badges and ornaments that could possibly be giuen vnto souldiers and men of war, in regard of their vertue and man-hood: yea, and now for a good while, our Emperors haue had this chaplet granted vnto them, in token and testimony of clemency: euer since that by our prophane and vnkind ciuill wars the world is grown to this passe, that it is reputed a singular demerit and gracious act, not to kill a citizen of Rome, but to let him liue. To this kind of garland, none other be comparable: for the Murall and Vallare coronets (bestowed vpon them that either scaled the walls, or entred the breach first into an enemy city, or els mounted ouer the rampier of a camp) albeit they were of gold, and of greater price by far, yet they gaue place to these. Yea, the very Nauall coronets, fashioned like the three forked pikes of ship beake-heads (wherewith they were honored, who had performed some braue seruice at sea) came behind these Ciuicke garlands, due to them who haue rescued citizens and saued them out of the enemies hands: and yet in these our daies there haue bin knowne two in that kind most renowned about the rest, whereof the one was bestowed vpon. *M. Varro* by *Pompey* the Great, for defeating the pyrats, and for scouring and clearing the seas of them: the other likewise giuen to *M. Agrippa*, by *Augustus Caesar*, for vanquishing the Sicilians, who also were no better than rousers.

Now forasmuch as we are light vpon the mention of Nauall or Rostrate coronets, this would be noted, That in old time the said braſen beake-heads of ships woon from the enemies, and set vpon the front of the Tribunal or publick pulpit in Rome, serued for an ornament to beautifie the Forum or common place of the city; so as the very body of the people of Rome seemed to be crowned and honored thereby. But after that the Tribunes in making seditious orations began to stamp and fare like mad men there, to trample (I say) vnder foot, and to pollute that sacred place and those goodly enſignes; after that they fel once euery man to make his priuat and particular profit of the common good, without regard to aduance the weale publick; after that each one sought to strengthen and arm himself by the benefit of authority, and that to the weakening of the main state, inſomuch as they who were reputed by their place sacrosanct and inviolable, polluted and prophaned all then the said ornaments of beake-heads, which beautified the place vnder their feet, serued to adorne the heads of Roman citizens. So as, to returne again now to the aboue named *Agrippa*, *Augustus Caesar* gaue vnto him a Nauall coronet for subduing the Sicilian Pyrats: and himselfe received of mankind a Ciuicke chaplet, for sparing the bloud, and sauing the liues of so many citizens.

In ancient time they vsed to crowne none but the gods. And hereupon it is, that the Poet *Homer* speaketh of no garlands and chaplets but due to the celeſtiall & heavenly wights, or at leastwise in the name of a whole army, for victory atchieued in some notable battell: for to one man alone he alloweth not any, no not in regard of the better hand in combat or single fight. And to say a truth, the first that euer set a Garland vpon his owne head, was prince *Bacchus*, and the same was made of Iuie: but afterwards, those that sacrificed to the honour of gods, not only ware chaplets themselves, but also adorned therewith the heads of the very beasts which were appointed to be killed for sacrifice. In the end, the custome was taken vp to honour them with gar-

A garlands, who wan prizes at those sacred and solemne games, *Olympia*, *Isthmia*, *Pythia*, and *Nemœa*. Howbeit the manner was then, and so continueth to this day, To giue chaplets to the said victors, not in their own name, but in the behalfe of their natie country, which by open proclamation they pronounce to be crowned and honored thereby. And hereof it came also, that such coronets and chaplets were granted to them that should triumph, yea and soone after to those also who had won the prise in any publick games, vpon condition to dedicate them to the temple of the gods.

To discourse what Roman citizen receiued this honor first of a chaplet or coronet, were a long peece of worke, and nothing pertinent to our purpose and matter in hand; considering that they were acquainted with none at all, but in regard of seruice performed in the wars. Yet thus much I may aue for certain, That no nation vnder heauen, nay put them all together, can shew so many sorts of chaplets and coronets, as this one state and people of Rome. *K. Romulus* crowned *Hostus Hostilius* with a garland of bare greene leaues, for that in the forcing and ruining of *Fidenæ*, he brake first into the city and made way for the rest. This man was grandfire to *Tullus Hostilius* king of Rome. Semblably in the war against the Samnites, wherein *Cornelius Cossus* the Conſull was L. Generall, the whole army crowned *P. Decius* the father with a chaplet of green leaues, who then was a martiall Tribune or Colonell ouer a regiment of souldiers, for that hee had saued and deliuered the said army.

But now to come againe to our Ciuicke garland, it was made at first of the *Ilex* or Holme tree leaues: afterwards men tooke a better liking to make it of the *Æsculus*, a tree consecrated to *Iupiter*. They staied not there, but changed soone after with the common oke; neither made they any precise choise, but tooke the leaues of that which came next hand, whereſoeuer they found it growing; provided alwaies that it bare acorns: for all the honor of these garlands consisted principally in the maſt. Moreouer, there belong to these Ciuicke garlands streight laws and ordinances, in which regard these chaplets be proud and stately: and we may be bold to compare them with that Paragon-coronet of the Greeks, which passeth al others, giuen solemnly and published in the presence of *Iupiter*, and made of the wilde Oliue dedicated vnto him: comparable (I say) to any crowne or chaplet whatſoeuer; euen to that, for which a city in token of ioy, would not stick to lay open a breach in their very wall to receiue it when it should enter in. The lawes ordained in this behalfe run in this forme: *Imprimis*, He that is to enioy the honour of a Ciuicke chaplet, ought, first to haue rescued a citizen, and wishall to kill the enemy in whose danger hee was. Item, It is required, That the enemies the same day held the verie ground and were Masters hereof, wherein the rescue was made and the seruice performed. Item, That the partie himselfe so saued, doe confesse the thing, for otherwise all the witnesses in the World answere not in this case. Item, the man thus deliuered, must bee a free Citizen of Rome in anie hand: for ſet case that hee were a King which was thus rescued, if hee were a stranger, and came onely amongst the auxiliaries to aide the Romanes, it would not boot, nor gaine any man this honour for to saue his life. Item, Say that the Generall himselfe were rescued and deliuered out of danger, the partie for his good seruice should haue no more honour due vnto him, than if hee had preserved but a simple common souldier, so hee were a Roman Citizen: for the makers of these ordinances aimed chiefly at the life of a Citizen whoſoeuer hee was, without regard of any other circumstance. Item, Hee that was once crowned with this garland, was endued also with

these priuiledges: That hee might weare it alwaies after, whenſoeuer it please him: That so often as hee came in place of publick playes or games, men should accusſomably rise up vnto him, yea, and the verie Senators themselves, doe him honour in that sort: That hee should haue his place allowed him to sit next vnto those of Senators degree: That both himselfe, and also his father and grandfire by the fathers side, should euer after bee exempt from all ciuile charges, and inioy full immunitie. Thus much concerning the lawes and priuiledges attending vpon the Ciuicke garland. *Siccius Dentatus* (as wee haue specified before) receiued foureteene of these chaplets for his good seruice: [*Manlius*] *Capitolinus* six, and hee verily had one of them for rescuing *Seruilus* beeing Generall of the Armie. As for *Scipio Africanus*, hee refused this honour when it was offered and presented vnto him, for sauing the life of his owne father at the iourney and battaile of *Trebia*. O the excellent orders and customes of those times, worthie of immortalitie and euerlasting memorie! O the wisdom of men in those daies, who assigned no other reward for so braue exploits and singular workes, but honour onely? And whereas all other militarie coronets they enriched and adorned with gold, they would not set the life of a citizen at any price. A plaine and euidēt

Rr

profession

* As the manner was to receiue the *Hittionica*.

profession of our ancestors and predeceffors, That it is an vnlawfull and shameful thing to seeme for to saue a mans life, in hope of any gaine and profit thereby.

CHAP. V.

¶ Of Mast, thirtene kinds.

MAny nations there be euen at this day, and such as inioy peace and know not what warre meaneth, whose wealth and riches lyeth principally in Mast: yea and elswhere in time of dearth and for want of other graine, folke vse to dry their mast, grind it into meale, temper it with water, and thereof make dough for bread. Moreover, euen at this day throughout Spaine, the manner is to serue vp acornes and mast to the table for a second seruice: and sweet-
 it is being roasted vnder the cinders and ashes, than otherwise. Ouer and besides, provided it is by an expresse act and law of the twelue tables in Rome, that a man may gather the mast that falleth from his owne trees into another mans ground.

Diuers and sundry sorts there be of Mast, and their difference consisteth in the forme and fashion of the fruit, in the site and scituation of the place, in the sex, and in the taste: for the mast of the Beech tree is of one figure and making, the Acorne (which is the mast of the Oke) another, and the mast of the Holme or Ilex, differeth from them both: yea & in euery one of these kinds, they do vary one from another. Also, some are of trees growing wild; others more milde and gentle, louing places well tilled and ordered by husbandry. Some like the hilly countries, others the champaine and the plains. Semblably there is mast comming from the male trees: there is againe that groweth on the female. In like maner, the rellish & tast maketh a difference and diuersity in mast. The sweetest of all, is the Beech mast: for *Cornelius Alexander* reporteth, That the inhabitants of Chios, when they were streightly beleaguered, indured the siege a long time by the benefit & substance only of that mast. We are notable distinctly to specifie name by name, the sundry sorts of mast and the trees which beare the same, considering that in euery cuntry they alter their names: for we see the Robur and the Oke to grow commonly euerie where, but the Esculus is not so rise in all countries. A fourth sort there is of the same kind, that is not known ordinarily in most places of Italy. We will therefore distinguish them according to their nature and properties: yea and when need shall require, by their Greeke names also.

CHAP. VI.

¶ Of the Beech mast, and other Masts: of Charcole, and the feeding of Hogs.

THe Beech mast is like to the kernell of a Chestnut, inclosed within a three cornered skin. The leafe of the tree is thin and very light, resembling that of the Poplar: it turneth yellow passing soone. In the middle whereof, for the most part, and in the vpper side, it bringeth forth a little green berrie, pointed sharpe at the toppe. The mast of Beech, Rats and Mice are much delighted in: mark therefore when there is store of that mast, ye shal haue as great increase of that vermin. It will feed also Reremice or Dormice fat: and the Oufels or Blackbirds take a great liking thereto, and wil flie vnto it. Lightly, all trees are most fruitful one yere than another, and beare most euery second yere; but aboue all, Beeches keepe this course. As touching Mast (which properly is so called) it groweth vpon the Robur, the common Oke, the Esculus, Cerrus, Ilex, and Cork tree. All kinds of mast are contained more or lesse, within a rough cup, which lieth close to the vtmost skin thereof, & claspeth it about. The leaues of all these mast trees, except the mast-Holme Ilex, be heauy, fleshie, large, waued or indented along the sides, neither be they yellow when they fall, as the Beech leaues are; longer also or shorter, according to the diuers trees whereupon they grow.

Of the Ilex or mast-Holme tree, there be two sorts. Those in Italy differ not much in leafe from the Oliue. Some Greeks call them Smilaces, but in other prouinces Aquifoliae. The mast of Ilex, both the one and the other, is shorter and slenderer than of the rest. *Homere* calleth it Acylon, by which name he distinguisheth it from other mast. The male Holmes (men say) beare no fruit. The best mast and the biggest, is the Acorn growing vpon the common Oke: next to it is that of the Esculus; as for that of the Robur, it is but small. The Cerrus carieth a mast vnpleasant to the eie, and rough to be handled, for clad it is with a cup beset with sharpe prickles like
 to

A to the Chestnut shell. Among the ver: Acornes, some haue a sweeter tast than others: the female Oke beareth those that be more soft and tender; the male, tough, thick, and massie: and the best simply are those that come of the broad leaved Oke, for so it is called by reason of the large leaues. Moreover, there is another difference in mast and acornes, for some be bigger than others; againe, there are that haue thin and fine skins inclosing the kernell; and ye shal find others for them as thick skinned; likewise many of them are couered with a rough and rustie tunicle; and as many againe do shew immediatly their bare white skin and naked fleshy substance. Furthermore, that mast is accounted good, which at both ends (taking it long-waies) groweth hard in manner of a stone; howbeit that which hath an hard shell without, and a soft body within, is better than that which is hardened in the carnous substance of the body; and lightly neither of both these qualities happeneth to any but the male kind. Ouer and besides, some you shall find fashioned long like an egge, others as round as a ball, and a third sort sharp pointed. The outward colour also yeeldeth variety: for some be blacker than other, but the whiter commonly be the better set by. Some are bitter toward the ends, and sweet in the mids. The length also & the shortnesse of the stele or taile whereto they hang, maketh a difference. The very tree it self causeth diuersity of the fruit: for that Oke which beareth the biggest mast, is named Hemeris. A shorter tree this is than the rest, with a round head, and putting forth many hollow airm-pits (as it were) of boughes and branches. The wood or timber of the ordinary and common Oke is tougher and harder than that of others, and lesse subiect to putrifaction: full of arms & boughes it is, as the other, but it groweth taller and is thicker in the body. The highest of all, is the Agilops, which longeth to grow in wild and desart places. Next to it for talnesse, is the broad leaved Oke, but the timber thereof is not so good and profitable for building, howeuer it be employed for to make charcole: yet being once squared to that purpose, & cleft, it is subiect to the worm, and will soon rot: and for this cause, being in quarters, they vse not to make cole of it clouen, but of the solid and round boughs or branches thereof. And yet this kind of charcole serueth only the Bloom-smithies and furnaces; the hammer-mills also of brasse and copper-smithies, whom it standeth in great good stead and sauet them much fewell; for it burneth and consumeth no longer than the bellows goe: let them leaue blowing once, presently the cole dieth; and so it lasteth long: for at euery new blast it is renewed againe and refreshed: otherwise it sparkleth very much and yeeldeth many cinders. But the charcole made of yong trees is the better.

D Now the maner of making them is this: when the wood is cut into many clefts & splents, fresh and green, they are heaped vp on high, and hollow, in manner of a furnace or chimney, and then well luted with clay in the top, and all about: which done, the pile of truncheons aforesaid, is set on fire within; and as the outward coat or crust of clay beginneth to wax hard, the workemen or colliers pierce it with poles and peaches, and make diuers holes therein for vent, and to let out the smokie vapor that doth sweate and breath from the wood. The worst of all other for timber or cole, is the oke named Haliphleos; a thicke barke it hath, and as big a body, but for the most part hollow and light like a sponge or mushroom: and there is not another besides it of all these kind of trees, that rotteth as it stands alieue. Besides, so vnfortunate it is, that the lightning smiteth it, as low as it groweth; for none of them ariseth to any great height: which is the cause that it is not lawfull to vse the wood thereof about the burning of any sacrifice. Seldome beareth it any Acorns, and those few that it hath, be exceeding bitter, so as no other beast will touch them but swine againe; nor they neither, but for pure hunger, when they can meet with no other food. Moreover, in this regard also reiected it is, and not employed in any religious vse, for that without blowing at the wood and cole thereof continually, it will not burne cleare and consume the sacrifice, but goeth out and lieth dead.

But to returne vnto our mast againe: that of the Beech tree feedeth swine quickly, maketh their flesh and lard faire and pleasant to the eie, tender to be soone sodden or roasted, light and easie of digestion, and good for the stomacke. The mast of the Holme causeth hogs to gather a more fast and compact flesh, their bodies to be neat, slender, lanke, and ponderous. Acornes doe engender a fleshy substance, more square and spreading, and the same also most heauy and hardest of digestion, and yet they are of all other kinds of mast, most sweet and pleasant. Next to them in goodness (by the testimony of *Nigidius*) is that of the tree Cerrus, neither is there bred of any other a courser flesh, howbeit hard it is, fast, and tough. As for the mast of Ilex, hogs are endangered by eating thereof, vnlesse it be giuen them warily by little and little. Hee sayeth
 moreover,

The sixteenth Booke of

moreouer, that of all other it falleth last. Moreouer, the mast of Esculus, Robur, and the Corke, G
causeth the flesh to be spongeous and hollow. To conclude, what trees soeuer beare mast, carry
also certaine nuts called Galls: and lightly they are full of mast but each other yeare. But the
oke Hemeris beareth the best galls, and fittest for the curriers to dresse their leather. The broad
leafed Oke hath a kinde of Galls like vnto it, but lighter in substance, and not so good by far:
it carrieth also blacke galls (for 2 sorts there be) and this is better for the dier to colour wooll.

CHAP. VII.

¶ Of the Gall-nuts: and how many other things Mast-trees doe
beare besides Mast.

THe nuts called Galls, doe euer breake out all at once in a night, and namely about the be-
ginning of Iune, when the Sun is ready to goe out of the signe Gemini. The whiter fort
thereof commeth to the growth in one day: and if in the first spring and breaking forth
thereof it be hot weather, it drieth and withereth out of hand, and commeth not to the full big-
nesse and perfection, namely to haue a kernell as much as a bean. The blacke of this kind conti-
nueth longer fresh and green, and groweth still, to the bignesse otherwhiles of an apple. The
best galls be those of Comagena: the worst is that of the oke called Robur, which are knowne
by the holes they haue, that may be seen through. The common oke Quercus, ouer and besides
the fruit (which is the mast) beareth many other things; for it carrieth both sorts of gal, the black
and the white: certaine berries also like Mulberries, but that they be dry and hard, resembling
for the most part a buls head, containing within them a fruit much like the kernels of the oliue. I
Moreouer, there grow vpon it certaine little bals not vnlike to nuts, hauing soft flox within good
to make candle-wick or matches for lamps; for burn they wil without any oile, like as the black
Gals. It beareth also other little pills or balls good for nothing, couered ouer with haire, & yet
in the spring time they yeeld a certain juice or liquor like hony. Furthermore, there breed in
the hollow arm-pits (as it were) of the boughes, other small pills fetled or sticking close to the
wood, and not hanging by any steles, which toward the nauill or bottome thereof are whitish;
otherwise they be speckled all ouer with black spots, saue that in the mids between they are of
a scarlet red colour: open them, and hollow they are within, but very bitter. Sometimes also this
oke engendreth certaine hard callosities, like Pumish stones, yea and other round balls made of
the leaues folded one within another: on the backside also of the leafe where it is reddish, yee K
shal find sticking certaine waterish pearls, white and transparent or cleare within, so long as they
be soft and tender, wherein there breed little flies or gnats: howbeit in the end they ripen and
wax harder, in manner of Galls.

CHAP. VIII.

¶ Of the Catkin called Cachrys: the graine of Scarlet: of Aga-
ricke, and Corke.

THe Oke called Robur, bringeth forth likewise a certaine pendant chat or catkin, named in
Greece Cachrys: for so they terme the little pill, which is of a burning and causticke Na-
ture, and whereof there is vse in Physick for potentiall cauteries. The like groweth vpon L
Firres, Larch trees, Pitch trees, Lindens of Tilletts, Nut-trees, and Planes, namely after that the
leaues be fallne; and abideth vpon the tree in winter time. These chats haue a kernel within like
to those of the Pine-nuts. It beginneth to grow in winter, & by the spring time al of it openeth
and spreadeth to the prooff; but when the leaues begin to bud and put forth, it falleth off. Thus
you see how fruitfull these okes be, and how many things besides mast, they do bring forth: and
yet they cease not nor giue ouer thus, for many times a man, shall see certaine excrecences
growing forth about their roots, such as roostfools & mushrooms; the last denifes that our glut-
tons haue inuented to whet their appetite and stomacke, and to maintaine gourmandize. The
common Oke breedeth the best of this kind: as for those that grow about the Oke Robur, the M
Cypresse, and Pine-tree, they are hurtfull to be eaten, and venomous. Moreouer, Hesiodus saith,
that the Okes Robora do beare Mifello, and yeeld hony. True it is indeed, that the hony-dewes
called Manna, falling from heauen (whereof we haue spoken before) light not vpon any other
leaves

A leaues more than of those okes. Moreouer, this is knowne for certain, that the ashes of this Oke
when it is burnt, hath a quality or taste of nitre or salt-peter.

Howbeit for all the riches and fruit that the Oke affourdeth, the Scarlet graine alone which
commeth of the Ilex, challengeth yea and ouermatcheth it. This graine is no other than a very
excrement or superfluity arising about the stem of the small shrub called Ilex Aquifolia, scra-
ped and pared off from it, like such refuse as they Cusculum or Quisquilium: but of such price
it is, that the poore people of Spaine gather it, & make a good part of their reuenue thereby,
euen as much as will pay halfe their tribute. As touching the commendable vse thereof in dy-
ing, we haue sufficiently spoken in the discourse of the purple tincture. This scarlet grain is in-
gendred also in Galatia, Africa, Pisidia, and Cicilia. But the worst of all other is that which
commeth out of Sardinia.

B As for Agaricke, it groweth in France principally vpon trees that beare mast, in manner of a
white mushroom: of a sweet sauer, very effectually in Physicke, and vsed in many Antidotes and
soueraigne confections. It groweth vpon the head and top of trees: it shineth in the night, and
by the light that it giueth in the darke, men know where and how to gather it.

Of all Mast-trees, the Oke called by the Greeks Ægylops, beare certaine drie excrecences,
swelling out like Touch-wood, couered all ouer with a hoary & hairy mosse, and these not only
beare out from the bark of the fruit, but also hang downe from the boughes a cubit in length:
and odoriferous they are, as we haue shewed in our treatise of Ointments.

C Now concerning Corke, the woody substance of the tree is very small, the mast as bad, hol-
low, spongeous, and good for nothing. The barke only serueth for many purposes, which will
grow again when the tree is barked, & that of such a thicknes, that it will beare 10 foot square.
Much vse there is of it in ships, & namely for boys to anere cables, also for flotes to trainels or
dragnets that fishers do occupy: moreouer in bungs & stoppels of barrels, bottles, and such like
vessels. Finally, our gentlewomen and dainty dames haue the soles of their pantofles & winter-
shoes vnderlaid therewith. In regard of which barke, the Greeks call it by a pretty name, and
not improperly, The bark tree, or the tree all barke. Howbeit somewhat haue it to be the fe-
male Ilex or Mast. Holm, and so they name it: and where there groweth no Ilex, in stead thereof
they take Corke, especially in Carpentry, and cart-wrights worke, as about Elis and Lacedæ-
mon. Neither groweth it in all parts of Italy, ne yet in any one quarter of France.

D

CHAP. IX.

¶ What trees they be that carry barke good for any vse.

THe peisants of the countrey and the rusticall people employ much, the barke also of Bee-
ches, Lindens or Tilletts, Firs, and Pitch trees; for thereof they make sundry vessels, as
paniers, baskets, and certain broad and wide hampers for to carry their corn and grapes in
time of haruest and vintage, yea and otherwhiles they couer their cottages therewith. Moreo-
uer, spies vse to write in barks (when they be fresh and greene) intelligences to their capitaines,
grauing and drawing their letters so, as that the sap and iuice thereof couereth them. To con-
clude, the bark of the Beech tree is vsed in certain religious ceremonies of sacrifice: but when
the tree is spoiled of the bark, it soone fadeth and dieth.

E

CHAP. X.

¶ Of Shindles: of the Pine tree, the wilde Pine, the Fir, Pitch tree, Larch tree,
Torch tree, and the Tew.

THe boards or shindles of the wild Oke called Robur, be of all others simply the best: and
next to them, those which are made of other mast-trees, and especially of the Beech. The
shindles are most easily rent or clouen out of all those trees which yeeld Roïn, but setting
aside the Pine-wood only, none of them are lasting. Cornelius Nepos writeth, that the house in
Rome were no otherwise couered ouer head but with shindles, vntil the war with K. Pyrrhus, to
wit, for the space of 470 yeres after the foundation of the city: and of a truth, the chiefe quarters
of Rome were diuided & distingly named by certain woods and groues neere adjoining. And
euen at this day there remaineth the quarter of Iupiter Fagutalis, where sometime stood a tuft or

Rr 3

groue

grove of Beeches: also the gate Querquetulana, bearing the name of an Oke row: likewise the hill Viminalis, from whence they used to fetch windings and bands of Officers: and many other groves, whereof some were set double, and were two of a name. We read in the Chronicles, that *Q. Hortensius*, Dictator for the time being, (when as the commons arose, and in that mutinie or insurrection forsooke the city and withdrew themselves to the fort Ianiculum) made a law & published it within a certain grove hard by, called Esculetum, where there grew a number of trees named Esculi: and the said statute ran in this forme, That whatsoever ordinance should be enacted by the said Commonaltie, it should bind all Citizens of Rome whomsoever to observe and keepe.

In those daies the Pine and Fir, and generally all trees that yeeld pitch, were held for strangers and aliens, because none of them were knowne to grow neere unto the city of Rome: whereof now we will speak, the rather because the beginning & whole maner of conceiting and preserving wines might be thereby thoroughly knowne. First and foremost, some of the trees aforesaid in Asia or in the East parts do bring forth pitch. In Europe there be six sorts of trees, seeming all of one race, which yeeld the same. Of which, the Pine and the Pinafter cary leaues thin and slender in manner of haire, long also and sharp pointed at the end. The Pine beareth least rosin of all others, howbeit otherwise some it hath in the very fruit thereof, which we call Pine nuts or apples (whereof we haue already written) yet so little it is, that hardly a man would reckon the Pine among those kinde of trees that yeeld rosin. The Pinafter is nothing els but the wild Pine: it growes wonderful tall, putting forth arms from the mids of the trunk or body upward; whereas the other Pine brancheth only in the head. This of the twain is more plentiful in rosin, whereof we will speake more anon. These wild Pines grow also vpon plains. There be trees vpon the coast of Italy, which men call Tibuli, and many think they be the same, although they carry another name: slender they are and shorter, altogether without knots, and little Rosin they haue in them or none: but they serue well for shipwrights, to build frigats & brigandines.

The Pitch tree loueth the mountains and cold grounds, a deadly and mournful tree it is, for they used in old time to sticke vpon a branch thereof at the doores of those houses where a dead corps was, to giue knowledge thereof abroad: and commonly it grew green in churchyards and such places, where the maner was to burn the bodies of the dead in funeral fires: but now adays it is planted in courtyards and gardens neer our houses, because it may be easily kept with cutting and shredding, it brancheth so well. This tree puts forth great abundance of rosin, with white grains or kernels comming between, so like vnto frankincense, that if it be mixt therewith, vneth or hardly a man may discern the one from the other by the eye. And hereupon it cometh, that Druggists and Apothecaries do sophisticate frankincense, and deceiue folk with it. All the sort of these trees are leaued with short thick and hard prickly bristles in manner of the Cypres. The Pitch tree beginneth to shoot forth branches euen from the very root almost, and those be but small, bearing out like armes, and sticking one against another in the sides. Semblably do the Fir trees, which are so much sought for to serue shipping: and yet this tree delighteth in the highest mountains, as if it fled from the sea of purpose, and could not away with it: and surely the form and maner of growing is all one with the pitch tree. The wood thereof is principal good timber for beams, and fitteth our turn for many other necessities of this life. Rosin if it be found in the Fir is thought a fault in the wood, whereas the only commoditie of the pitch tree is her rosin; and yet sometime there frieth and sweateth out a little thereof in the extreme heate of the sun. The timber of them both is not alike, for that of the Fir is most faire and beautifull; the pitch tree wood serueth only for clouen lath or rent shindles, for coopers to make tubs and barrels, and for some few other thin boords and painels.

As for the Larch tree, which is the fift kind of those that beare rosin, like it is to the rest, and loueth to grow in the same places: but the timber is better by ods, for it rots not, but will last and endure a long time: the tree will hardly be killed: besides, it is red of colour, & carries an hotter and stronger smel than the other. There issueth forth of the tree as it growes, good store of liquid rosin, in colour like hony, somewhat more clammy, which will neuer grow to be hard.

A sixt sort there is of these trees, and it is properly called Teda [i. the Torch tree:] the same yeelds more plenty of moisture and liquor than the rest: lower it is of growth than the Pitch tree, but more liquid and thin: very commendable also to maintain fire at sacrifices, & to burn in torches for to giue light. These trees, I mean the male only, bring forth that strong and stin-

king

A king rosin, which the Greeks call Syce. Now if it happen that the Larch tree proue Teda, [i. to be Torch-wood] it is a signe that it doth putrifie and is in the way of dying.

The wood of all these kinds before named, if it be set a fire, maketh an exceeding grosse and thick smoke, and presently turneth into a cole, spitting and sparkling a far off; except that only of the Larch tree, which neither burneth in light flame, nor maketh cole, ne yet consumeth in the fire otherwise than a very stone.

All these trees whereof we speake continue greene all the yeare long: and very like they are in leafe, that men otherwise of cunning and good experience, haue enough to do to discern one from the other by it, so neere of kin they be, and their race so much intermingled. But the pitch tree is not so tall as the Larch: for the Larch is thicker in body, of a thinner and lighter barke, more shag leaued, and the said leaues fatter, growing thicker, more pliable, and easier to wind and bend: whereas the leaues of the pitch tree hang thinner, they be of a drier substance, more slender and subiect to cold: and in one word, the whole tree is more rough and hideous to see to, and withall, full of rosin: the wood also resembleth the Firre, rather than the Larch.

The Larch tree, if it be burnt to the very stumpe of the root, will not spring againe and put forth new shoots: whereas the pitch tree liueth stil for all the fire, and wil grow afresh: the experience whereof was seen in the Island Lesbos, at what time as the Forrest Pyrrhæum was set on fire, and clean burnt to the ground.

Moreover, euery one of these kinds differ in the very sex: for the male of each kind is shorter and harder: the female taller, hauing fatter leaues, and the same soft and plain, & nothing stiff and rugged. The wood of the male is tough, and when it is wrought keepeth not a dire & grain, but windeth and turneth, so as the carpenter must goe euery way about it with axe and plaine: contrariwise that of the female is more firm and gentle. And commonly the axe or the hatchet wil tell the difference of male and female in any tree: for what wood soeuer it be, it will soone find and feeble the male: for hardly is it able to enter, but either turnes edge, or rebounds againe: and whether a man hew or cleaue withall, it maketh more crassing and a greater noise where it fetleth and taketh hold; it sticketh also faster, and with more ado is plucked forth. Moreover, the very wood of any male tree is of a more brown and burnt colour, yea, and the root of a blacker hew.

About the Forrest Ida within the territory of Troas, there is another distinction of trees in the same kind: for some grow vpon the mountaines, others toward the coast on the sea side. In Macedony, Arcadia, and about Elis, these trees oftsoons change their names, so that the Greek writers are not agreed how to distinguish their several sorts, and range them in their due kind. I therefore haue exprest them according to the iudgment of Roman and Latine Authors.

Of all the trees aboue named, the Fir surpasseth for bignesse, and the female is the taller. The timber also is more firm and soft, more profitable also, and easier to be wrought: the tree it self rounder, and so it brancheth archwise: the boughes as they resemble wings stretched out and displaied, so they stand so thick with leaues, that they will beare off a good shower, in so much as no rain is able to pierce through. In sum, the female Firre is far more louely and beautifull euery way than the male.

All the sort of these foresaid trees, saue onely the Larch, beare certain knobs like Catkins or Chats, composed (as it were) of many scales wrought one ouer another, and those hang downe dangling at the branches. These knobs or clogs in the male Firre haue in the vpper end a kernel within: but those of the female haue no such thing. Moreover, the pitch tree as it hath such catkins lesse and slenderer; so all within, from one end to the other, the kernels be passing little and black withall, like to lice or fleas, which is the reason that the Greekes call it Phthirophoros. The said catkins of the male pitch trees are more flat, and nothing so round as those of the females, lesse gummie also, and not so moist of the rosin.

To come now to the Yugh, because we would ouerpasse none: it is to see to like the rest, but that it is not so green; more slender also and smaller, vnpleasant and fearefull to looke vpon, as a cursed tree, without any liquid substance at all: and of these kind of trees, it alone beares berries. The fruit of the male is hurtful: for the berries in Spain especially haue in them a deadly poison. And found it hath bin by experience, that in France the wine bottles made thereof for wavfaring men and traouellers, haue poisoned and killed those that drunke out of them. *Sesimus* saith, That the Greekes call it Smilax: and that in Arcadia it is so venomous, that who soeuer take

take

take either repose or repast vnder it, are sure to die presently. And hereupon it commeth, that those poisons wherewith arrow heads be inuened, after some were called in times past Taxica, which wee now name Toxica. But to conclude, it is seen by good prooffe, that if a brassen wedge or spike be driuen into the very body of the tree, it loseth all the venomous nature, and becommeth harmlesse.

CHAP. XI.

¶ How to make all kinds of Pitch. The maner how Cedrium is made. Also, of thicke Pitch, how it is made; and in what sort Rosin is boiled.

THe liquid Pitch or Tar throughout all Europe is boiled out of the Torch tree: and this kind of pitch serueth to calke ships withall, and for many other vses. Now the manner of drawing Tarre out of this tree, is, to cut the wood thereof into pieces, and when they are piled vp hollow into an heape, to make a great fire within, as it were vnder a furnace, being claid without forth: thus with the heate of the fire it doth fry and seeth again. The first liquor that sweateth and issueth forth runneth cleare as water, in a channell or pipe made for the purpose, and this the Syrians call Cedrium: which is of such force and efficacy, that in Egypt they vse to embalme the dead bodies of men and women departed, and keep them from putrefaction. At the next running it is thicker, and this second liquor is very pitch. Howbeit this is cast again into certaine coppers or cauldrons of brasse, and together with vineger sodden a second time, vntill it come to a thicke * consistence: and when it is thus thickened, it taketh the name of Brutian pitch, good only for tuns, barrells, and other such vessels. Much like it is to the former pitch, but that it is more glutinous and clammy, redder also of colour, and more fatty. And thus much concerning the pitch made of the Torch tree.

As for that which comes of the pitch tree, the rosin thereof is drawne with red hot stones in certain vessels made of strong and thick oken planks: or in default thereof, the wood is clouen into pieces, and piled together after the order of a charcole hearth, & so the pitch boiles forth. The vse hereof when it is beaten into a kind of meale or poulder, is to be put into wine, and it is of a blacker colour than the rest. The same pitch-rosin, if it be boiled more lightly with water, and be let to run through a strainer, comes to a reddish colour, and is gleeue: and thereupon it is called stilled Pitch. And for this purpose lightly, is set by the more grosse and faultie substance of the rosin, together with the bark of the tree. But there is another composition and manner of making of pitch, that serueth for heady wine, called Crapula. For the floure of the Rosin is taken green and fresh, as it distillerh from the tree, together with a good quantitie of small, thin, and short spils or chips of the tree plucked away with the same: the same are minced or shred so small, as they may passe through a sieue or a riddle: which don, all is put into scalding water, and there boileth vntill it be incorporate with the water. The fat substance that is strained and pressed from hence, is the excellent pitch Rosin, hard to come by, and not to be found in Italy, vnlesse it be in few places vnder the Alps, and very good it is in physick. Now to make it passing white, there must be taken one gallon of the rosin, & sodden in two gallons of rain water. But some think it the better way to seeth it a whole day together at a soft fire, without any matter at all, in a pan or vessell of Latron. Others there be likewise that boile Turpentine in a hot frying pan, and are of opinion, that this is the best of all others. And the next to it in goodness is the Lentiske rosin, called Mastich.

CHAP. XII.

¶ Of the Pitch Zopissa, which is scraped from ships: and of Sapium. Also what trees are in request for their timber.

IT would not be forgotten, that the Greeks haue a certaine Pitch, scraped together with wax from the ships that haue lien at sea, which they Zopissa (so curious are men to make experiments and try conclusions in euery thing:) and this is thought to be much more effectually for all matters that pitch and rosin are good for, by reason of the fast temperature that it hath gotten by the salt water.

For

A For to draw rosin out of the * Pitch-tree, it must be opened on the Sun side, nor by giuing a slit or gash in the bark, but by cutting out a peece thereof, so that the tree may gape and lie bare two foot at the most: and from the earth, this wound to be at least a cubite. Neither doe they spare the entire bodie and wound of the tree, as they do in the rest: for there is no danger thereof, considering that the very chips of the wood being cut out, are full of liquor, and do serue to make pitch. But the nearer that the said ouerture or hole is made to the earth, the better is the rosin that issues forth: for if it be higher it is better. When this is don, all the humor afterwards runneth to the vicer or incision aforesaid, from euery part of the tree. The like it doth in the Torch pine. When it hath left running to the first hole, there is a second likewise made on another side, and so still is the tree opened euery way: vntill at length tree and all is hewn downe, and the very pith and marrow thereof serueth for Torch wood to burne. Semblably, in Syria they vse to plucke the barke from the Terebinth: yea, and they pill the boughes and roots too for Terpentine, howsoeuer in other trees the rosin issuing out of those parts, is not counted good; in Macedonie the manner is to burne the male Larch, but the roots onely of the female for to draw out pitch. Theopompus wrate, that there is found in the territorie of the Apolloniars, a kind of mineriall pitch, called Pissaspaltum, nothing inferiour in goodness to the Macedonian.

The best pitch in all countries, is that which is gathered from trees, standing vpon the North wind, and in places exposed to the Sunne-shine. As for that which commeth from shadowie places, it is more vnpleasant to the cie, and carieth besides a strong and stinking sauer. If it bee a cold and hard winter, the pitch then made is the worse, there is also lesse store of it, & nothing is so well coloured. Some are of opinion, That the pitch issueth in more abundance out of trees in the mountaines, also that it is better colored, sweeter in tast, more pleasant also in smell, namely, while it is raw pitch-rosin, and as it runneth from the tree: but if it be boiled, it yeelds lesse plentie of pitch than that which commeth of trees in the plain, and runneth all into a thin liquor in manner of whey, yea, and the very trees themselues are smaller. But both the one and the other, as wel the mountain pines and pitch-trees, as those of the plaines, yeeld not so much pitch in a faire and drie season, as when the weather is rainy and full of clouds. Moreover, some there be of these trees that yeeld forth fruit (which is their rosin) the very same yere that immediately followeth their incision; others, two yeres after; yea, and some againe in the third yere. As for the incision or open wound that is made, it filleth vp with rosin: for neither doth it founder or vnite in manner of a skar, ne yet closeth the barke againe: for in this tree, being once diuided it will neuer come together and meet.

Among these trees, some haue reckoned one kind by it selfe named Sapium, because it is replanted and groweth of some of the sions or imps of the said trees, in maner as hath been shewed before in our treatise of nut-kernells. The neather parts of which tree they call Teda [i. Torch-wood:] whereas indeed this tree is no other than the Pitch-tree, brought to a more mild and gentle nature by transplanting. As for that which the Latines call Sapinus, it is nothing else but the wood or timber of these kinde of trees, being hewed or cut downe, as well * hereafter declare in place conuenient.

* Chap 39. of his booke.

CHAP. XIII.

¶ Of the Ash, foure kinds thereof.

THere be many trees besides that Nature hath brought forth, only for their wood and timber: and among them the Ash, which of all others, growes most plentifully in euery place. A tall tree this is & grows round, bearing leaues set in maner of feathers or wings; much ennobled by the praise and commendation that the Poet Homer giueth it, as also for the speare or lance of Achilles, made thereof. And in very truth, the wood serueth right well for many vses. As for the timber of the ash, growing vpon the Forrest Ida in Troas, it is so like the citron wood, that when the barke is off, a man may hardly discern the one from the other, insomuch, as the merchants and chapmen are deceiued therewith.

F The Greekes haue made two kinds of the Ash: the one runneth vp tall and euen without a knot: the other is lower, more tough and hard, and withall, of a more browne and dusky color: and the leaues resemble the Lawrell. In Macedony they haue an Ash, which they call Bumelia, which of all other is the tallest and biggest, the wood thereof is most pliable and bending. Others

thers haue put a difference betweene Ashes, according to the places: for that of the plaine and champion cuntry, hath a more curled or frised graine than the other of the mountaines, but contrariwise, the wood of this is more compact and harder than the other. The leaues of this tree, according to the Greeks, are hurtfull, venomous and deadly to Horses, Mules, and such laboring garrons; but otherwise to beasts that chew the cud, they be harmlesse. Howbeit, in Italy if horses, &c. do brouse of the leaues, they take no harme thereby. Moreouer, they be excellent good, and nothing so soueraigne can be found against the poison of serpents, if the iuice thereof be pressed forth and giuen to drinke; or to cure old vlcers, if they be applied and laid thereto in manner of a Cataplasme: nay, so forcible is their vertue, that a serpent dareth not come neare vnto the shadow of that tree, either morning or euening, notwithstanding at those times it reacheth farthest; you may be sure then they will not approach the tree it selfe, by a great way. And this am I able to deliuer by the experience which I haue seene, that if a man doe make a round circle with the leaues thereof, and enuiron therewith a serpent and fire together within, the serpent will chuse rather to go into the fire, than to flie from it to the leaues of the Ash. A wonderfull goodnesse of dame Nature, that the Ash bloometh and flourisheth alwaies before that serpents come abroad; and neuer sheddeth leaues, but continueth greene, vntill they be retired into their holes; and hidden within the ground.

CHAP. XIII.

¶ Of the Line or Linden tree, two sorts thereof.

Great difference there is euery way between the male & female Linden tree: for, the wood of the male is hard and knottie, of a redder colour also, and more odoriferous than the female. The barke moreouer is thicker, and when it is plucked from the tree, it is stiffe, and will not bend. It beareth neither seed nor floure, as the female doth: which also is rounder and bigger in bodie, and the wood is whiter, more faire and beautifull by farre than is the male. A strange thing it is to consider, that there is no liuing creature in the world will touch the fruit of the Linden tree, and yet the iuice both of leaf and barke is sweet ynough. Between the bark and the wood of this tree there be thin pellicles or skins lying in many folds together, whereof are made bands & cords called Brazen ropes. The finest of these pellicanes or membrans serued in old time for to make labels and ribbands belonging to chaplets, and it was reputed a great honor to weare such. The timber of the Linden or Tillet tree will neuer be worm-eaten.* The tree it selfe is nothing tall, but of a meane height, howbeit the wood is very commodious.

CHAP. XV.

¶ Ten kinds of the Maple tree.

The Maple in bignesse is much about the Linden tree: the wood of it is very fine and beautifull, in which regard, it may be raunged in the second place, and next to the very Citron tree. Of Maples there be many kinds: to wit, the white, and that is exceeding faire and bright indeed, growing about Piemont in Italie, beyond the riuer Po, & also beyond the Alps, and this is called the French Maple. A second kind there is, which hath a curled graine running too and fro with diuers spots; the more excellent worke whereof, resembling the eies in the Peacockes taile, thereupon took also the name. And for this rare and singular wood, the countries of Istria and Rhætia be chiefe. As for that which hath a thicke and great graine, it is called Crassiuenum of the Latines, and is counted to be of a baser kind. The Greekes distinguish Maples by the diuerse places where they grow. For that of the champion or plaine cuntry (which they name Glion) is white, and nothing crisped: contrariwise, the wood of the mountaine Maple is harder and more curled, and namely, the male of that sort, and therefore it is in great request for most exquisite and sumptuous workes. A third sort they name Zygia, which hath a reddish wood, and the same easie to cleaue: with a barke of a swert colour, and rough in handling. Others would haue it to be no Maple, but rather a tree by it selfe, and in Latine they call it Carpinus.

CHAP.

CHAP. XVI.

¶ Of the Besses, Wennes, and Nodosities, called Bruscum and Molluscum: of the wild Fisicke or Bladder nut-tree called Staphylodendron: also three kinds of the Box tree.

The bunch or knurre in the Maple, called Bruscum, is passing faire, but yet that wich is named Molluscum, excelleth it. Both the one and the other swell like a wen out of the Maple. As for the Bruscum, it is curled and twined after a more crawling and winding manner; whereas the Molluscum is spread with a more direct and strait course of the grain. And certes, if there might be planks hereof found broad enough to make tables, doubtlesse they would be esteemed and preferred before those of the Citron wood. But now it serueth only for writing tables, for painels also and thin bords in waincote work, to set out beds heads and footings, and such are seldome seen. As for Bruscum, there be tables made of it inclining to a blackish color. Moreouer, there be found in Alder trees such nodosities; but nor so good as those, by how much the wood of the Alder it selfe is inferior to the Maple, for beauty and costlines. The male Maples do put forth leaues and flourish before the female. Yea, and those that grow vpon dry grounds are ordinarily better esteemed than those of moist and waterish places, in like sort as the ashes.

Beyond the Alps there is a kind of bladder Nut-tree; whereof the wood is very like to the white white Maple, and the name of it is Staphylodendron. It beareth certain cods, and within the same, kernels in tast like the Filberd or Hazell-nut.

Now for the Box tree, the wood thereof is in as great request as the very best: seldom hath it any grain crisped damask-wise, and neuer but about the root; the which is dudgein and full of work. For otherwise the grain runneth streight and euen without any wauing: the wood is sad enough and weighty: for the hardnesse thereof and pale yellow colour much set by and right commendable. As for the tree it selfe, gardeners vse to make arbors, borders, and curious works thereof. Three sorts there be of the Box tree: the first is called the French Box, it groweth taper-wise, sharp pointed in the top, and runneth vp to more than ordinarie height. The second is altogether wild, and they name it Oleastrum, good for no vse at all, and besides carieth a strong and stinking sauer with it. The third is our Italian box, and so called. Of a sauage kind I take this to be also: howbeit by setting and replanting brought to a gentle nature. This spreadeth and brancheth more broad, and herewith a man shall see the borders and partitions of quarters in a garden, growing thick and green all the yeare long, and kept orderly with cutting and clipping. Great store of box trees are to be seen vpon the Pyrenæan hills, the Cytorian mountains, and the whole Berecynthian tract. The thickest and biggest Box trees be in Corsica, and they beare a louely and amiable floure, which is the cause that the hony of that Island is so bitter: there is not a beast that will eat the fruit or grain thereof. The Boxes of Olympus in Macedonie are more slender than the rest, and but low of growth. This tree loueth cold grounds, yet lying vpon the Sun. The wood is as hard to burn as iron: it will neither flame nor burn cleare it selfe, nor serue to make charcole of.

CHAP. XVII.

¶ Of the Elme foure kinds.

Between these wild trees abovesaid, and those that bear fruit, the Elm is reckoned of a middle nature, in regard of the wood and timber that it affords, as also of the friendship & acquaintance that it hath with vines. The Greekes acknowledge two sorts thereof, namely, one of the mountains, which is the taller and the bigger; and the other of the plaines & champion, which is rather more like a shrub, the branches that it shooteth forth are so smal and slender. In Italy men hold the Elmes about Atinum to be the tallest, and of those they prefer them which grow in dry grounds, and haue no water comming to them, before those by riuers sides. A second sort of them, which are not all out so great, they call the French Elmes. The third kinde be the Italian Elmes, thicker growne with leaues than the rest, and those proceeding in greater number from one stem. In the fourth place be ranged the wilde Elmes. The Atinian Elmes

* Any herin is deceived. For the Line Tree with vs is comparable to the highest Oakes in tallnesse.

Elmes aboue said beare no Samara (for so they cal the seed or grain of the Elme.) All the kind of them are planted offets taken from the roots, whereas others come of seeds.

CHAP. XVIII.

¶ *The nature of trees as touching the place where they grow.*

Having thus discoursed in particular of the most famous and noble trees that are, I think it not amisse to say somewhat of their natures in generall. And first to beginne with the mountain high countries: the Cedar, the Larch, and the Torch-tree loue to grow among the hills; like as all the rest that ingender rosin: semblably, the Holly, the Box tree, the Mast-Holme, the Iuniper, the Terebinth, the Poplar, the wilde Ash, the Beech, and the Carpin. Vpon the great hill Apennine there is a shrub named Cotinus, with a red or purple wood, most excellent for in-laid works in Marquetry. As for Firs, the wild hard oaks (Robora) Chestnut trees, Lindens, Mast-holmes, and Cornell trees, they can away with hills and vallies indifferently. The Maple, the Ash, the Seruis tree, the Linden, and the cherry tree, delight in the mountains neere to waters. Lightly a man shall not see vpon any hills, Plum trees, Pomegranat trees, wild Oliues, Walnut trees, Mulberry trees, and Elders. And yet the Cornel tree, the Hase, the common Oke, the wild Ash, the Maple, the ordinary Ash, the Beech, and the Carpin, are many times found to come downe into the plaines: like as the Elme, the Apple tree, the Peare tree, the Bay tree, the Myrtle, the Bloud shrubs, the Holme, and the Broome (which naturally is so good for to dry clothes) do as often climbe vp the mountains. The Seruis tree gladly groweth in cold places, so doth the Birch, and more willingly of the twaine. This is a tree which is meere French, and came first out of France: it sheweth wonderfull white, and hath as fine and small branches or twigs, which are so terrible to the offenders, as wherewith the Magistrates rods are made for to execute justice. And yet the wood of this tree is passing good for hoopes, so pliable it is and easie to bend: the twigs thereof serue also for to make paniers and baskets. In France they vse to boile the wood, and thereof draw a glutinous and clammy slime in manner of Bitumen. In the same quarters there loueth to grow for company the white thorn, which in old time they were wont to burne for torches at weddings, and it was thought to be the most fortunate and lucky light that could be deuised, because (as *Massurius* reporteth) the Romane shepherds and heardmen who rauished the Sabine maidens, were furnished euery one with a branch thereof to make them torches. But now adaies the Carpine and Hazel are commonly used for such nuptial lights. The Cypress, walnut, Chestnut trees, and the Laburnum, cannot in any wise abide waters. This last named is a tree proper to the Alps, not commonly known: the wood thereof is hard and white: it beares a blossom of a cubit long, but Bees will not settle vpon it. The plant likewise called Iouis Barba, so handsom to be cut in arbors and garden works, which groweth so thicke and round withall, full of leaues, and those of a siluer colour, hates waterie places. Contrariwise, Willows, Alders, Poplars, and Osiers, & the Priver which is so good for to make dice, will not grow well and prosper but in moist grounds. Also the Vacinia or Whortles, set and sowed in Italy for the Fowlers to catch birds withall; but in France for the purple colour, wherewith they vse to die clothes for their seruants and slaues.

To conclude, this is a generall rule, What trees soeuer will grow indifferently as well vpon hills as plaines, arise to be taller, bigger, and carry a fairer head to see to in the low champion grounds: but timber is better, and caries a more beautifull grain vpon the mountaines, except only Apple trees and Pyrries.

CHAP. XIX.

¶ *A diuision of Trees according to their generall kinds.*

Moreouer, some trees lose their leaues, others continue alwaies green. And yet there is another difference of trees before this, and whereupon this dependeth. For trees there be which are altogether wild and sauage: there be again which are more gentle and ciuill: and these names me thinks are very apt to distinguish them. Those trees therefore which are so kind and familiar vnto vs, as to serue our turns either with their fruit which they bear, or shade which they yeeld, or any other vertue or property that they haue, may be very aptly and fitly be called ciuill and domesticall.

CHAP.

CHAP. XX.

¶ *Of Trees that neuer shed their leaues: also of Rhododendron.*

AMong these trees and plants which are of the gentle kind, the Olive, the Lawrel, the Date tree, Myrtle, Cypress, Pines, Ivy, and the Oleander, lose not their leaues. As for the Oleander, although it be called the Sabine herb, yet it commeth from the Greeks, as may appeare by the name Rhododendron. Some haue called it Nerion; others Rhododaphne: it continueth alwaies green leaved, beareth floures like roses, and brancheth very thicke. Hurtfull it is and no better than poison, to Horses, Asses, Mules, Goats, and Sheepe; and yet vnto man it serueth for a countrepoyson, and cureth the venom of serpents.

CHAP. XXI.

¶ *What trees shed not their leaues at all: which they be that lose them but in part: and in what countries all trees are euier greene.*

OF the wild sort, the Fir, the Larch, the wilde Pine, the Iuniper, the Cedar, the Terebinth, the Box tree, the Mast-holme, the Holly, the Cork tree, the Yew, and the Tamariske, be green all the yeare long. Of a middle nature between these two kinds aboue named, are the Adrachne in Greece, and the Arbut or Strawberry tree in all countries: for these lose the leaues of their waterboughs, but are euier green in the head. Among the shrubs kind also there is a certain bramble and Cane or Reed, which is neuer without leaues. In the territorie of Thurium in Calabria, where sometime stood the city Sybaris, within the prospect from the said Citie, there was an Oke aboue the rest to be seen, alwaies green and full of leaues, and neuer began to bud new before Midsummer: where by the way I maruel not a little, that the Greek writers deliuered thus much of that tree in writing, and our countrymen afterwards haue not written a word thereof. But true it is, that great power there is in the clymat, in so much as about Memphis in Egypt, and Elephantine in the territorie of Thebais, there is not a tree, not so much as the very Vine, that sheddeth leaues.

CHAP. XXII.

¶ *The nature of such leaues as fall from trees: and what leaues they be that change colour.*

ALL trees without the range of those before rehearsed (for to reckon them vp by name particularly were a long and tedious piece of work) do lose their leaues in winter. And verily this hath bin found and obserued by experience, that no leaues doe fade and wither, but such as be thinne, broad, and soft. As for such as fall not from the tree, they be commonly thick skinned, hard, and narrow: and therefore it is a false principle and position held by some, That no trees shed their leaues which haue in them a fatty sap or oleous humiditie: for who could euier perceiue any such thing in the Mast-holme? a drier tree there is not, and yet it holdeth alwaies green. *Timaeus* (the great Astrologer and Mathematician) is of opinion, that the Sun being in the signe Scorpio, he causeth leaues to fall, by a certain venomous and poysoned infection of the aire, proceeding from the influence of that maligne constellation. But if that were true, we may wel and iustly maruell, why the same cause should not be effectually likewise in all other trees. Moreover, we see that most trees do let fall their leaues in Autumne: & some are longer ere they shed, continuing green vntill winter be come. Neither is the timely or slow fall of the leafe long of the early or late budding: for wee see some that burgen and shoot out their spring with the first, and yet with the last shed their leaues and become naked: as namely the Almond trees, Ashes, and Elders. And contrariwise the Mulberry tree putteth forth leaues with the latest, and is one of them that soonest sheddeth them again. But the cause hereof lies much in the nature of the soile: for the trees that grow vpon a leane, dry, and hungry ground, do sooner cast leafe than others: also old trees become bare before younger; and many of them also lose their leaues before their fruit be fully ripe: for in the Fig tree, that commeth and beareth late, in the winter Pyrry, and Pomegranate, a man shall see in the later end of the yere fruit

Sf

only

only, and no leaues vpon the tree. Now as touching those trees that continue euer greene, you must not think that they keep still the same leaues, for as new come, the old wither & fall away: which hapneth commonly in mid-Iune about the Summer Sunne-stead. For the most part, the leaues in euery kind of tree do hold one and the same colour, and continue vniform, save those of the Poplar, Ivy, and Croton, which wee said was called also Cici [*id est*, Ricinus, or Palma Christi.]

CHAP. XXIII.

¶ Three sorts of Poplar: and what leaues they be that change their shape and figure.

* Taken by
some to be
our Aspe.

OF Poplars there be found three sundry kinds, to wit, the white, the blacke, and that which is named * Lybica, or the Poplar of Guynee: this hath least leaues, and those of all other blackest: but now commendable they are for the fungous meazles (as it were) that come forth thereof. As for the white Poplar leafe, the leaues when they be yong, are as round as if they were drawn with a paire of compasses, like vnto those of Citron before named: but as they grow elder, they run out into certain angles or corners. Contrariwise, the Ivy leaues at the first be cornered, and afterwards become round. All Poplar leaues are full of downe: as for the white Poplar (which is fuller of leaues than the rest) the said downe flieth away in the aire like to mossie chats or Thistle-downe. The leaues of Pomegranats and Almond trees stand much vpon the red colour. But very strange it is and wonderfull which hapneth to the Elme, Tillet, or Linden, the Oliue tree, Aspe, and Sallow or Willow: for their leaues after Midsummer turn about vpside downe, in such sort, as there is not a more certaine argument that the Sun is entred Cancer, and returneth from the South point or Summer Tropicke, than to see those leaues so turned.

CHAP. XXIII.

¶ What leaues they be that vse to turne euery yeare. Of Palme or Date tree leaues, how they are to be ordered and used. Also certain wonderful obseruations about leaues.

Here is a certain general and vniuersal diuersitie & difference obserued in the very leaf: for commonly the vpper side which is from the ground, is of greene grasse colour, more smooth also & polished. The outside or nether part of the leaf hath in it certain strings, sinues or veins, brawns and ioyns, bearing out like as in the back part of a mans hand: but the inside cuts or lines in manner of the palme of ones hand. The leaues of the oliue are on the vpper part whiter and lesse smooth; and likewise of the Ivy. But the leaues of all trees for most part, euery day do turn and open to the Sunne, as desirous to haue the inner side warmed therewith. The outward or nether side toward the ground of all leaues, hath a certaine hoary downe more or lesse here in Italy, but in other countries so much there is of it, that it serueth the turn for wooll and cotton. In the East parts of the world they make good cordage and strong ropes of date tree leaues (as we haue said before) and the same are better, & serue longer within than without. With vs these Date leaues are pulled from the tree in the Spring, whiles they are whole and entire; for the better be they which are not clouen or diuided. Being thus plucked, they are laid a drying within house foure daies together. After that, they be spread abroad and displaied open to the Sun, and left without dores to take all weathers both day and night, and to be bleached, vntill they be dry and white: which done, they be sluied and slit for cord-work. But to come again to other leaues, the broadest are vpon the Fig-tree, the Vine, and the Plane; the narrowest vpon the Myrtle, Pomegranat, and oliue: as for those of the Pine and cedar, they be hairy: the Holly leaues and all the kindes of Holme be set with sharpe prickles. As for the Iuniper, in stead of leafe it hath a very pointed thorne. The Cypresse and Tamariske carrie fleshie leaues: those of the Alder be most thick of all other. The Reed and the Willow haue long leaues: the Date tree hath them double. The leaues of the Peare tree are round, but those of the Apple tree are pointed; of the Iuie cornered: of the Plane tree diuided into certaine incisions; of the Pitch tree and the Fir cut in, after the maner of comb-teeth; of the wild

hard

A hard Oke, waued and indented round about the edges; of the brier and bramble, sharpe like thornes all the sk in ouer. Of some, they be stinging and biting, as of Nettles: of others ready to pricke like pins or needles, as of the Pine, the Pitch tree, the Larch, the Firre, the Cedar, and all the sorts of Holly. The leaues of the Oliue tree, and the Mast-Holme, hang by a short stele, the Vine leaues by a long. The Poplar or Aspen leaues doe shake and tremble, and they alone keep a whistling and rustling noise onewith another. Moreouer, in the very fruit it selfe, and namely in a certain kind of Apples, ye shall haue small leaues breake out of the very sides in the mids; in some single, in others double and two together. Furthermore, there be trees that haue their leaues coming forth about their boughs and branches, others at the very end and shoot of the twig; as for the wild Oke Robur, it putteth leaues forth of the trunk and maine stock.ouer and besides, the leaues grow thicker or thinner in some than in others; but alwies the broad and large leaues, are more thinne than others. In the Myrtle tree, the leaues grow in order by ranks; those of the Box tree turn hollow; but in the Apple trees they are set in no order at all. In Pyrries & Apple trees both, ye shall see ordinarily many leaues put forth at one bud, hanging at one and the same taile. The Elme, and the Tree-trifolie, are full of small and little branches. *Casto* addeth moreouer and saith, That such as fall from the Poplar or the Oke, may bee giuen as fodder to beasts, but he wils that they be not ouer drie: and he saith expressly, that for kine and oxen, Fig-leaues, mast Holm leaues, and Luie, are good fodder: yea and such kind of beasts may well broule and feed of Reed leaues and Bay leaues. Finally, the Seruise tree looseth her leaues at a once, others shed them by little and little one after another. And thus much for the leaues of trees.

CHAP. XXV.

¶ The order and course obserued in Nature as touching plants and trees, in their conception, flourishing, budding, knotting, and fructifying. Also in what order they put forth their blossomes.

THE manner and order of Nature yeare by yeare, holdeth in this wise: first, trees and plants do conceiue by the meanes of the Westerne wind Fauonius, which commonly beginneth to blow about sixe daies before the Ides of Februarie: for this wind is in stead of an husband to all things that grow out of the earth, and of it they desire naturally to be conceiued, like as the Marcs in Spaine, of which we haue written heretofore. This wind is that spirit of generation which breathes life into all the world; which the Latines call thereupon Fauonius, & *fauendo*, [*i.e.* cherishing and nourishing euery thing] as some haue thought. It blowes directly from the Equinoctiall Sun-setting, and euermore beginneth the Spring. This time, our rustical peasants call the Seasoning, when as Nature seemeth to goe proud or assaut, and is in the rut and furious rage of loue, desirous to conceiue by this wind, which indeed doth viuifie and quicken all plants and feeds sowne in the ground. Now of all them conceiue not at once, but in sundry daies: for some are presently sped in a moment, like as living creatures: others are not so hastic to conceiue, but long it is first ere they retaine, and as long againe before their vitall seed putteth forth; and this is therupon called their budding time. Now are they said to bring forth and be deliuered, when in the Spring they bloome, and that blossome breaketh forth of certain matrices or ventricles. After this, they become nourees all the while they cherish and bring vp the fruit: and this time also the Latines call Germinatio, [*i.e.* the breeding season.] When trees are full of blossomes, it is a signe that the Spring is at the height, and the yeare become new againe. The blossom is the very ioy of trees, and therein standeth their chief felicity: then they shew themselves fresh and new, as if they were not the same; then be they in their gay coats; then it seemeth they striue aie onewith another in varietie of colours, which of them should excell and exceed in beautifull hew. But this is not generall, for many of them are denied this pleasure, and enjoy not this delight; for all trees blossome not: some are of an heauie and sad countenance, neither cheare they at the coming of this new season and glad some Spring; for the mast-Holme, the Pitch tree, the Larch, and the Pine doe not bloome at all, they are not arrayed in their robes, they haue not their lueries of diuers colors to fore-signifie (as messengers and vaucourriers) the arriual of the new yeare, or to welcome and solemnize the birth of new fruits. The Figge trees likewise both tame and wild, make no shew of floures: for they are not

S f 2

too

too soon bloomed (if they bloom at all) but they bring forth their fruit. And a wonderful thing it is to see what abortive fruit these Figge-trees haue, and how it neuer commeth to ripeness. Neither doe the Iunipers bloome at all. And yet some writers there be who make two kinds thereof: and they say, that the one flowreth, and bears no fruit, as for the other which doth not blossom, it brings forth fruit vpon fruit, and berrie vpon berrie, which hang two yeres vpon the tree before they come to maturitie. But this is false, for in very truth all Iunipers without exception, haue euermore a sad looke, and at no time shew merie. And this is the case and condition verily of many a man, whose fortune is neuer in the floure nor maketh any outward shew to the world. Howbeit there is not a tree but it buddeth, euen those that neuer blossom: And herein the diuersitie of the soile is of great power: for in one and the same kind, such as grow in marsh grounds, do shoot and spring first; next to them, those of the plaines; and last of all they of the woods and Forrests. And generally the wilde Pyrries growing in woods doe bud later than any other. At the first coming of the western wind Faunius, the Corneil tree buddeth; next to it, the Bay; and somewhat before mid-march or the spring Equinoctiall, the Tillet or Linden, and the Maple, the Poplar, Elme, Willow, Alder, and Filberds or Hazell nut trees, bud with the first. The Palme also maketh hast and is loth to come behind. All the rest at the point and prime of the spring, namely the Holly, the Terebinth, the Paliurus, the Cheston, and the Walnut-trees, or Mast-trees. Apple trees are late ere they bud, but the Corke tree longest of any other. Trees there be that put forth bud vpon bud, by reason that either the soile is exceeding battill and fat, or else the weather faire and pleasant: and this happeneth more to be seene in the blades of corne. But trees if they happen to be ouer rancke in new shoots and buds, they waxe wearie and grow out of heart.

Moreouer, some trees there be that naturally do sprout at other seasons besides the spring, according to the influence of certaine starres, whereof the reason shall be rendred more conueniently, in the third booke next ensuing after this. Meane time this would be obserued, That the winter spring of trees is about the rising of the Ægle-star: the Summer budding at the rising of the Dog-star: and a third, when the star Arcturus is vp. And for the two later, some would haue them verily to be common to all trees, but most evidently seen, in Fig-trees, Vines, Pomegranate trees: and they yeeld a cause, For that in Thessalie and Macedonie the Fig tree about these times putteth forth most plentifully: and in Ægypt this reason is to be seene most apparently. As for all other trees, certaine it is, that when they begin once to bud, they hold on and shoot forward continually without intermission. The wild Oke, the Fir, and the Larch tree, haue their seuerall shoots in one yere, and spring at three sundrie times, giuing ouer between whiles; and therefore they put forth the sprouts between the skales of their barks: a thing vsually happening to all trees in their budding & breeding time: for after they be once conceiued, their rind or bark bursteth withall. Now their first budding is in the prime & beginning of the spring, and continueth much about 15 daies. They bud a second time in the moneth of May when the sun passeth thorough the signe Gemini: by which time it is evidently to be seen, how the bud heads that came first, are driuen and thrust vp higher by those that follow after; & that appeares more plainly by the encrease of the knots & joynts. As for the third budding, it is very short, namely at * midsummer, and lasteth not aboue a seuen-night: and euen then also may a man perceiue manifestly by the knots and joynts of the shoots how much they are put forth and grown. The Vine alone shooteth twice, to wit, when the first beginneth to burgen & put forth a grape; and a second time, when the formeth and digesteth or concocteth the same. As for those trees that blossom not, they haue no more to doe but only to bring forth their fruit, and so proceed to ripen it. Now there are some trees, which no sooner bud, but they shew also a blossom; and yet as hasty as they be that way, they take their leisure afterwards, and long it is ere their fruit come to be ripe: and such are the Vines. Others again be as backward and slow both to bud and blossom; but they make speed to ripen their fruit, as the Mulberry tree, which of ciuile and domesticall trees, is the last that buds, and neuer before all the cold weather is past; and therefore she is called the wisest tree of all others: but after that she begins once to put forth buds, she dispatches her busines out of hand, inasmuch as in one night she hath done; and that with such a force, that in the breaking forth a man may evidently heare a noise. Of those trees that conceiue in winter, about the rising of the Ægle-star, (as we haue before said) the Almond tree is the first that blossometh in the moneth of Ianuarie, and by March the Almond is ripe. The next that blossometh

A blossometh after it, be the Peach Plum-trees of Armenia, then the Iuboe trees called Tuberes, and the Abricots. As touching the former, they be meere strangers, but these Abricots are forced by Art and industrie of man. As for wild and sauage trees, by course of nature the Elder floures first, and hath of all other most plentie of pith or marrow within, whereas the male Corneil hath none at all. But of domesticall and ciuile trees, the Apple tree beginneth to blossom; and soone after the Pyrry, Cherrie tree, and Plum tree, inasmuch as they seeme all to floure together. Next to them, is the Lawrell; anon after it, the Cypress; and then the Pomegranat, and the Fig tree: Vines and Oliue trees do but then burgen and bud, when those other be in their floure: for in truth they conceiue late, namely, at the rising of the Vergilia or Brood-hen; for this is the proper star to the influence whereof these trees be subject: and it is Iune first and the summer Sun-stead, before the vine bloomes; and so it is with the Oliue tree, but that it cometh somewhat later. All trees be seuen daies at the least in their blossoming; and some be longer ere they giue ouer, but none passe a fortnight: and done they haue euer by the eight day before the Ides of Iuly, which are forerunners of the Etesian winds. Finally, some trees there are which doe not knit nor shew their fruit immediatly vpon their blooming.

CHAP. XXVI.

Of the Corneil tree. Also, what is the proper time wherein euery tree beareth: which trees be they that beare not, and which be reputed vnluckie. Also of those trees which soonest lose their fruit. Last of all, what trees shew fruit before lease.

C AS for the Corneil tree, it is about midsummer or the summer Sun-stead, before it putteth forth any fruit, which at first is white, afterwards red as blood. But the female of this kind beareth after Autumne, sowre berries, and such as no beast will abide to tast. The wood thereof also is spongy, hollow, and good for nothing, whereas that of the male is counted among the hardest that be: so great difference there is in trees of one and the same kind. Moreover, the Terebinth, Maple, and Ash, yeeld their fruit or seed in harvest time: Walnuts, Apples, and Peares (vnlesse they be some winter fruits, or of the hasty kind) ordinarily are readie to be gathered in the Autumne. All mast trees be later ere they render their fruit, to wit, about the going downe of the Vergilia or beginning of the winter, saue only the Æsculus, which passeth not the Autumne. As for certain Apple trees and Peare trees both, as also the Corke tree, their fruit is not to be gathered before winter begin. The Firre putteth forth a blossom of a yellow color like Saffron, about mid-Iune or the summer sun-stead; but the Brood-hen star is downe before the fruit be ripe. The Pine, and Pitch tree, do bud before the Firre some fifteen daies, or thereabout; and it is winter first, and the foresaid Vergilia or Brood-hen is likewise set, before their fruit is ripe. Citron trees, Iunipers, and mast-Holmes, are counted trees that beare all the yere long, and the old fruits of the former yere tarieth on the tree vntill new come, and they hang both together. But aboue all other trees, the Pine is a wonder in nature; for a man shall euer find vpon it some of the fruit readie to be ripe; and some againe that will remaine vnto the next yere, and the third yere before it will be readie: and there is not another tree that is more forward and greedie (as it were) to put forth it selfe, and giue greater hope of increase, than it doth: for look in what month soeuer the Pine-nuts are gathered from the tree, in the very same others are in good forwardnesse of ripening; and in such sort the ordereth the matter, that euery month a man shall haue ripe fruit on her. Those Pine-apples or nuts which cleaue and open vpon the tree, bee called Zamia; and well may they be so named, for vnlesse they be plucked, they hurt and corrupt the rest. The only trees that bear no fruit at all, that is to say, not so much as seed, are these; the Tamariske, good for nothing but to make Beesoms of; the Poplar, Alder, Atinian Elme, and the Alaternus, which hath leaues resembling the Holme, and partly the Oliue. As for such trees which neither at any time are set or planted, nor yet beare fruit, they be holden for vnfortunate, accursed, and condemned, in such sort, as there is no vse of them in any sacrifice or religious seruices. Crenutius writeth, That the (Almond) tree whereon Iadic Phyllis hanged her selfe, had neuer (after) greene leaues on it. Such trees as yeeld gum, after they haue put forth their bud, do cleaue and open: howbeit the gum that issueth out, neuer commeth to any thicknesse, vntill the fruit thereof be gathered. Young trees commonly beare not so long as they

Sf 2

they shoot and grow. The Date tree, the fig tree, the Almond tree, the Apple tree, and the Pyrie, do soonest of all other let their fruit fall before it be fully ripe. Semblably, the Pomegranat tree, which is so tender besides, that with euery thicke and heauie dew, white frost, and foggie time, the wil be bitten & shed the blossom: which is the cause that folk vse to bend the boughs thereof downward to the ground, that both dew and rime may sooner fall off which lights vpon them, and otherwise would ouer-load and hurt them. The Pyrie and the Almond tree cannot abide close and clouidie weather, especially if the wind be Southerly, although no raine do fall: for in such daies, if they chance to blossom, they not only shed their flowre, but lose their fruit new knit. But the Sallow or Withie tree, is of all others most ticklish, and soonest forgoes the seed or chats that it beareth before it commeth to any ripenes: for which cause, called it is of *Homer* * Loose-fruit, or Spill-fruit. Howbeit the age ensuing (naught as it was) hath interpreted that Epithet of his, in another sense, according to the wicked experience they had of it, whereby it was found, that the seed therof causeth barraine in women, and hindreth conception. But in this regard, Nature hath well done also to prevent this mischiefe and inconvenience, in that she hath not been very carefull to preferue the seed: and yet for the maintenance of the whole kind, she hath endued it with this gift, To grow very quickly, if a man do pricke into the ground but a cutting or twig thereof. And yet (by report) there is one Willow in Candie, and namely about the very descent of *Iupiters* caue, which is wont ordinarily to carie the graine or seed thereof vntill it be full ripe, and then is it of a rough and writhen shape, of a wooden and hard substance, and withall, of the bignesse of a cich pease.

Moreover, some trees there be that proue barraine and fruitlesse by the occasion of the imperfection of the soile and territorie where they grow: and namely in the Isle Paros, there is a whole wood or coppise that vsually is lopt and cut, but it neuer beareth any fruit. The Peach trees in the Island Rhodos blossom only, and otherwise are fruitlesse. Ouer and besides, this difference of trees (that some be fruitfull and others barraine) ariseth of the sexe also, for commonly the males beare not: howsoeuer some affirme cleane contrary, and say, They are the male only that be fruitfull, and the female barren. Furthermore, it falleth out many times that trees be fruitlesse, either because they grow too thick one by another, or else are ouercharged and too ranke with boughs and branches: but of such as do beare, some bring forth their fruit both at the sides, and also at the very tips and ends of their branches; as the Peare tree, Pomegranate tree, Figge tree, and Myrtle. As for others, they are of the nature of corne and pulse; for the one grows in the eare or spike alone, the other by the sides, & not otherwise. The Date tree onely (as hath been said before) containeth fruit within certain pellicles, and the same hangeth down in clusters after the manner of grapes. Other trees beare their fruit vnder the leafe for their safeguard and defence, except the Fig tree, which hath her Figs about the leafe, because it is so large and overshadowie. Moreover, the leafe of the fig tree commeth forth after the Figge. One notable thing is reported of a kind of figge-trees in Cilicia, Cyprus, and Hellas, to wit, that they haue this propertie singular by themselves, To bring forth their perfect Figs vnder leafe, and their Greene abortiue Figs that come to no prooffe, after the leafe. The Fig tree beareth moreover certain hastie Figs, which the Athenians call *Prodromos*, i. want-courriers or forerunners, because they be long ripe before others. The Laconian Figge trees bring the fairest and greatest Figs.

CHAP. XXVII.

¶ Of trees that beare twice and thrice in one year. Also what trees soonest wax old: and of their ages.

IN the same countries aboue-named, there be Figge trees also that beare Figges twice in one year. And in the Island Cea, the wild Figge trees beare thrice in the same year: for the second increase is put forth on the first, and the third vpon the second: and by this third fruit, the Figges of the tame Figge tree receiue their maturitie by way of caprification: and those wild Greene Figges of theirs come forth about the leafe. Moreover, there be some Pyries and Apple trees that bring forth fruit twice a year: as also there be others of the hastie kind, which do beare both Peares and Apples betimes in the year. There is a kinde of Crab tree also or Wilding, that in like manner beareth twice a year; and the later fruit is ripe presently after

A after the midst of September, especially in places lying well vpon the Sun. As touching Vines, there be of them also, that after a fort beare three times in the year, which thereupon men call *Insanas*. [The mad or foolish vines:] for whiles some of the grapes be ripe, others begin to swell and wax big, and a third fort againe are but then in the flower. *M. Varro* writeth, That in Smyrna by the sea side there was a vine that bare fruit twice a year, as also an Apple tree in the territorie of *Consentia*. But this is an ordinary thing throughout all the country about Tacapa in Africa, and neuer is it seen otherwise there, so fertile is the soile; but thereof will wee write more at large hereafter in another place. As for the Cypress trees, they faile not but come with fruit thrice in one year: and their berries be gathered in Ianuarie, May, and September, and all of a diuers bignesse, one from the other. Ouer and besides, the very trees themselves are not laden with fruit after one and the same manner: for the Arbut or Strawberry tree is more plentiful in the head, and toward the top: the Oke, the Wal-nut-tree, Fig-tree (and namely that which beareth the vnusurie great figs *Mariscæ*) are more fruitfull beneath. Generally, all trees the elder they are, the sooner they beare and make more hast to ripen their fruit; the rather also if they grow in a ground leane, and exposed to the Sun. Contrariwise, trees that be wild are later in bearing than other: and some of them neuer yeeld fruit fully ripe. Moreover, such trees vnder which the ground is tilled & laid hollow, haue their fruit sooner ripe, & are more fruitfull withall, than those that are neglected and not looked vnto. Besides all this, there is a difference in trees as touching bearing their fruit, according to the age: for the Almond tree & the Pyrie are, most fertile when they be old, as also mast trees, and a certain kind of fig-trees. Al others, the yonger they are, the more fruitfull they be, howbeit, later it is ere their fruit be ripe: a thing most plainly to be obserued in Vines. For the better wine commeth from the elder Vines: but more plenty from the yonger. As for the Apple-tree, it becommeth of all other soonest old, and in that age the fruit is nothing so good as in youth: for both lesser be the Apples, and also more worm-eaten, in so much as the very wormes will breed in them vpon the tree. The Fig is the fruit alone of all trees, that needeth some help of * *Phyficke* to ripen. And this may be noted for a strange and miraculous thing in them, That the later figs bee in more price than the hasty and early ripe, and that there should be more reckoning made of preposterous and artificiall things beside the course of kind, than of the naturall. Also this is a generall rule, Whatsoeuer tree is exceeding fruitfull, and beareth most, the same continueth least while, and soon waxeth old. Yea and some of them are to be seen to die out right, and that very quickly, because they inioyed so fauorable a season, to cause them so to spend themselves with bearing; as wee may marke most easily in Vines.

CHAP. XXVIII.

¶ Of the Mulberrie tree.

CONtrariwise, the Mulberry tree lasteth long, and is very late ere it seemeth old. For why? it is not giuen greatly to beare fruit, neither is ouerladen with Mulberries. To conclude, look what trees haue a curled graine in the wood, as the Maple, Date-tree, and Poplar, they continue a long time before they decay. And in one word, such as haue their roots digged or delued often and laid bare about, are not long liued, but soone age and decay.

CHAP. XXIX.

¶ Of wilde trees.

AS for wilde trees, they indure longest of all others. And generally, as carefull tending and looking to trees, maketh them more fertile: so there is nothing sooner bringeth age vpon them, than fruitfulness and much bearing. Hereupon it is likewise, that such trees both bud and also blossom sooner than others, yea, and ordinarily their fruit is ripe before the rest: in regard whereof, they are more subiect to the iniury of the time & the weather, which causeth also diuers and fundry infirmities. Moreover, as we haue said already in the chapter of mast trees, there be many that bring forth fruits of different sorts: among which may be reckoned the Lawrell, with her variable floures and berries growing so thicke, and principally the barren of that kind which beareth nothing els, and therefore is esteemed of some the male. The Hazels also

so and Filbara trees, besides, their nuts do carry certain chats with a callous substance of skales G
joined one within another, but good for nothing.

CHAP. XXX.

¶ Of the Box-tree: the Greeke Beane or the Lotus.

Among these is to be ranged the Box-tree, which bringeth forth the most varietie of all others. For it putteth forth a seed of her owne, also, a graine which they call Carthegon: besides, on the North side Misselto, and on the South Hyphear: whereof wee will write a none more at large: so that otherwhiles a man shall find foure diuers things vpon the Box all together.

Moreover of trees, some be simple or single, to wit, such as from the root haue one trunk or body, and no more, and yet many boughes and branches; as the Oliue, Fig-tree, and the Vine: others be of a shrubs kind, and put forth many shoots from the root besides the main trunk, as the Rhamne, thorn Paliurus, and the Myrtle. In like maner the Hazell nut-tree. Howbeit, the better is the tree and more plenteous in fruit, when it is well branched from the body, and hath not those suckers from the root: ye shall find some again haue no principall stock at all, as wee may see in a kind of Box, and a certain Lotus beyond sea. Others be forked in twain, yea in fiew, immediately from the root: and ye shall meet with those that put vp many trunks out of the earth, but branch not into boughes, as namely, the Elders; as also with others that forke not, nor are diuided at all, howbeit, they be full of arms & boughs, as the Pitch-trees. Moreover, some there be which haue their boughes disposed in good order, as the Pitch-tree, Firre, or Deale: others again be as disorderly, as the Oke, Apple-tree, and Pyrrie. As for the Fir verily, where it is diuided into boughs, they grow directly vp right vnto heauen, and spread not in breadth about the sides. But a strange and wondrous thing it is of this tree, that if it be headed, or the tops only of those arms cut off, the whole dieth thereupon: but if they be lopped off close to the body, it continueth still aliue. Nay, in case it be cut vnder the place where the branches put forth, the stock or stump that is left, will take no harme by it, but remaine and liue: crop the head onely thereof, and the whole tree dieth. To proceed, some trees spread into arms immediately from the root, as the Elme: others branch only toward the top, as the Pine, and the Greek Beane, which at Rome for the pleasant tast of the fruit, resembling cherries very much, although it be of a wild nature, they call Lotus. This tree is much planted about faire houses, in the court yards, especially because the boughs spread so large; for albeit the stock or body it selfe be but very short and small, yet it brancheth so, as that it yeldeth much shade: yea, and often times the boughes reach to the neighbor housen. But there is not a tree againe that maintaineth this shade a lesse while; for when Winter is once come, the leaues shed, and then it admitteth the warm Sun for it. Moreover, there is not another tree that beareth a fairer barke, nor more pleasant to the eie, nor that carieth either longer boughes, and more in number than it, or stronger: a man that seeth them, would say they were so many trees by themselves. As touching the vse and commodities of this tree, the barke serueth to colour skins and leather: the root to die wooll. And as for the fruit or Apples that it beareth, they are a speciall kind by themselves: for all the world they resemble the snouts or muzzles of wild beasts, and many of the smaller sort seeme to hang to one that is bigger than the rest.

As concerning boughs of trees, some are termed blind, because they put not forth certaine eies or chits where they should bud: which happeneth somtime by a naturall defect, when they are not of validity to thrust out a bud; otherwhiles it is occasioned by some wrong and iniurie done, namely, when they be cut off, and in the place of the cut, there groweth as it were a callous skar that dulleth the vertue of the tree. Furthermore, looke what is the nature that forked trees haue in their boughes, the same hath the Vine in her eies and burgeons; the same also haue canes and reeds in their joints and knots.ouer and besides, all trees toward their root, and the nearest to the ground, are thicker than else where. Some run vp altogether in height, and therein shew thir growth, as the Firre or Deale tree, the Larch, Date-tree, Cypress, Elme, and generally all that rise vp in an entire stocke, and are not diuided. Of those also that branch and put out many boughes, there is a kind of Cherry-tree that is found to beare armes like beames forty cubites long, and two foot in thicknesse square throughout the whole length.

CHAP.

CHAP. XXXI.

¶ Of the Boughes, Barke, and Roots of trees.

There are trees, that immediately from the root thrust out boughes and branches, as do the Apple-trees. Some be couered with a thin rind, as the Lawrell and the tree: others with a thicke barke, as the Oke. In some a man shall find the barke euen and smooth, as in the Apple-tree, and fig-tree: the same in others is rough and rugged, as is to be seene in Oke, and Dare-trees. And ordinarily, all old trees haue more riueld barks and furrowed, than the young. In many trees the bark naturally doth breake and cleaue of the own accord, and namely in the Vine. From some it shaleth and falleth off, as from the Apple tree and the Arbut. The cork and the Poplar haue a fleshie and pulposus barke: the rind of the Vine and the Reed, is made in manner of a membrane or thin skin. In Cherry trees it is as slender as paper, and runneth into rolls: but Vines, Lindens, and Firs, are clad with tunicles and coats of many folds. In some again the rind is but single, as in the Fig-tree, and the Cane or Reed. And thus much of Barke.

There is as great difference in the root. For the fig-tree, the Oke, and the Plane, haue great store of roots and large spurns: contrariwise, in the Apple tree they are short and small: the firre and Larch haue one tap root and no more: for vpon that one main master-root they rest and are founded; howbeit, many small strings and petie spurns shoot out of the sides. In the Bay-tree the roots be more grosse and vnequally embossed, and likewise in the oliue, which also spreadeth out into many branches. But those of the oke be of a carnos substance: and verily, all the kind of okes do root deep into the ground. Certes, if we giue credit to Virgil, that sort of them which are called Efculi, go down as deep into the earth with their roots, as they arise & mount aboue with their heads. The roots of the Apple-tree, Oliue, and Cypress, lie very ebbe, and creep hard vnder the sould of the ground. Moreover, there be roots that run direct and streight, as those of the Bay and Oliue: there be againe that wind and turne as they go, as those of the fig-tree. Some are all ouergrowne and full of hairy strings, as the firre-root, and many others of wild trees that grow in Forrests: from which the mountains vse to pluck those fine fibers & small threds, wherewith they twist goodly faire paniers, couers for flaggons and bottels, and work many other vessels & prety deuises. Some writers [as namely Theophrastus] hold opinion and haue put down in their books, that no roots goe lower into the earth, than that the Sunnes heat may pierce vnto them and giue them a kind warmth; the which is more or lesse, say they, according to the nature of the soile, as it is either lighter or lean, or massier, richer, and faster compact. But I take this to be a meere vnruth. This is certain, that we find in antient writers, that a yong Fir, when it was to be transplanted and set again, had a root that went eight cubits within the earth; and yet it was not digged vp all whole, but broken in the taking vp, and left somewhat behind. The roots of Citron trees are biggest of all other, and spread most. Next to them are those of the Planes, Okes, and other Mast-trees. Some trees there be, the roots wherof like better & liue longer, the more ebbe that they lie within the vpper face of the ground, and namely, Lawrels; and therefore they spring fresh againe, and put forth better, when the old stock is withered and cut away. Others hold, that trees which haue short stumped roots, do sooner decay, & liue lesse while. But deceived they are, and may be reproued by the instance of fig-trees, which liue least while, and yet their roots are longest of any other. I suppose this also to be as false, which some haue held and deliuered in writing, That the roots do diminish and decay, as the trees do waxe old; for the contrary hath bin seen by an aged oke, which by the violent force of a tempest was ouerthrowne, the root wherof tooke vp a good acre of ground in compass.

Moreover, a common thing it is and ordinary, to replant and recouer many trees that haue bin blown down and laid along; for they will reioine, knit againe, and reuiue, by meanes of the earth, euen as a wound doth unite by the solder of a callous cicatrice. And this is a most vsuall and familiar practice obserued in the Planes, which by reason of their great heads so thicke of boughes, gather windes most, and are soonest subiect to their rage: if any one of them by that means be fallen, they lop their boughes, and discharge them of their weightie load, and then set them vp right again in their owne place, as it were in a socket, and they will take root and prosper. And in good faith, this hath bin done heretofore already in Walnut trees, Oliues, and many other, to the like purpose.

CHAP.

CHAP. XXXII.

¶ Of certaine prodigious trees, and presages obserued by them. By what meanes trees grow of their owne accord. That all plants grow not euery where: and what trees they be that are appropriate to certaine regions, and are not elsewhere to be found.

WE read in Chronicles and records, that many trees haue fallen without wind and tempest, or any other apparent cause, but only by way of prodigie and presage of some future euent: and the same haue risen againe of themselves without mans helpe. This happened during the wars against the Cymbrians, to the great astonishment of the people of Rome, who thereupon gathered a fore-tokening of great consequence: for at Nuceria in the groue of *Iuno*, there was an old Elme fell, and after the head was lopped off, because it light vpon the very altar of *Iuno*, it arose of it own accord; and that which more is, immediately vpon it put forth blossoms and flourished. And this was obserued, That from that very instant, the majesty of the people of Rome began to take heart, reuiue, and rise again, which had bin decayed and infeebled by so many and so great losses that the Romans had receiued. The like chanced (by report) neer the city Philippi, vnto a Willow tree which was fallen downe, and the head of it cut off cleane: semibly, to an Aspen tree at Stagyræ, neere vnto the colledge or publik place of Exercise there. And all these were fortunate presages of good luck. But the greatest wonder of all other was this, of a Plane tree in the Isle Antandros, which was not only fallen, but also hewed and squared on all sides by the Carpenter; and yet it rose againe by it selfe, and recouered the former greenesse and liued, notwithstanding it bare 15 cubits in length, & foure elnes in thicknesse and compasse.

All trees that we are beholden vnto the goodnesse of Nature for, we haue by 3 meanes: for either they grow of their owne accord, or come of seed, or else by some shoot springing from the root. As for such as we inioy by the art and industry of men, there be a great number more of deuises to that effect: whereof we will speake apart in a seuerall booke for that purpose. For the present our treatise is of trees that grow in Natures garden onely, wherein she hath shewed her selfe many waies after a wonderfull manner, right memorable.

First and foremost, as we haue shewed and declared before, euery thing will not grow in euery place indifferently: neither if they be transplanted, will they liue. This happeneth sometimes vpon a disdain, otherwhiles vpon a peeuish forwardnesse and contumacie, but oftner by occasion of imbecility and feeblenesse of the very things that are remoued and translated; nay, one while the climate is against it, & enuious; otherwhiles the soile is contrary therunto. The balm tree can abide no other place but Iury. The Assyrian Pome-citron tree will not beare elsewhere than in Syria. As for the Date-tree, it scornes to grow vnder all climates; or if it be brought to that passe by transplanting, it refuseth to beare fruit. But say, that it fortune by some meanes, that she giueth some shew and apparance of fruit, she is not so kind as to nourish and reare vp to perfection, that which she brought forth, forced against her will. The Cinnamon shrub hath no power and strength to indure either the aire or earth of Syria, notwithstanding it be a neere neighbor to the naturall region of her natiuity. The daintie plants of Amomum or Spike-hard, may not away with Arabia, howbeit they be brought out of India thither by sea: for king *Seleucus* made triall therof: so strange they are to liue in any other country but their own. Certainly, this is a most wonderful thing to be noted, That many times the trees for their part may be intreated to remoue into a forrain country, and there to liue; yea, and otherwhiles the ground and soile may be perswaded and brought to accord so wel with plants (be they neuer such strangers) that it will feed and nourish them; but vnpossible it is to bring the temperature of the aire and the climat to condescend thereto and be fauourable vnto them. The Pepper-trees liue in Italy; the shrub of Casia or the Canell likewise in the Northerly regions; the Frankincense tree also hath been knowne to liue in Lydia: but where were the hot gleames of the Sunne to be found in those regions, either to dry vp the waterish humor of the one, or to concoct and thicken the gumme and Rosine of the other? Moreover, there is another maruell in Nature, well-neare as great as that, namely, that she should so change and alter in those same places, and yet exercise her vertues and operations otherwhiles againe, as if there were no change nor alteration

A ration in her. She hath assigned the Cedar tree vnto hot countries: and yet wee set it to grow in the mountaines of Lycia and Phrygia both. She hath so appointed and ordained, that cold places should be hurtfull and contrary to Bay-trees, howbeit, there is not a tree prospereth better, nor groweth in more plenty vpon the cold hill Olympus, than it. About the streights of the Cimmerian Bosphorus, and namely, in the city Panticapæum, both *K. Mithridates*, and also the inhabitants of those quarters, vsed all meanes possible to haue the Lawrel and the Myrtle there to grow, only to serue their turns when they should sacrifice to the gods: it would neuer be, did they what they could: and yet euen then, there were good store of trees there growing of a warm temperature; there were Pomegranates and Fig-trees plenty; and now adaies there be Apple-trees and Pyrries in those parts, of the best and daintiest sort. Contrariwise, ye shall not find in all that tract any trees of a cold nature, as Pines, Pitch-trees, and Firres. But what need I to goe as farre as to Pontus for to auerre and make good my word? Goe no farther than Rome, hardly and with much adoe will any Chestnut or Cherrie trees grow neere vnto it, no more than Peach-trees about the territory of Thufculum. And worke enough there is to make hazels and filbards to like there: turne but to Tarracina thereby, ye shall meet with whole woods full of Nut-trees.

CHAP. XXXIII.

¶ Of the Cypresse tree. That oftentimes some new plants do grow out of the ground, which were neuer knowne to be there beforetime.

THe Cypresse hath bin counted a neere stranger in Italy, & most vnwilling there to grow, as we may see in the works of *Cato*, who hath spent more words, and made oftner mention of the Cypresse alone, than of all other trees whatsoeuer. Much ado there is with it before it come vp; and as hard it is to grow, and when all is done, the fruit is good for nothing. The berries that it beareth, be wrinckled, and nothing louely to the eie; the leaues wherewith it is clad, bitter in tast; a strong and violent smell it hath with it, not so much as the very shade thereof is delectable and pleasant; and the wood but small & not solide, but of an hollow substance: insomuch, as a man may range it among the kinds of shrubs. Consecrated is this tree to *Phaon*; & therefore men vse to set a bough thereof as a signe, before those houses wherein a dead corpse lieth vnder boud. As touching the female Cypresse, it is long ere she beareth. The Cypresse tree for all this, in the end growing vp to a pyramidall forme sharp pointed, is not rejected but much set by, if it were for nothing els but to stand between euery row and ranke of Pine-trees; howbeit, now adaies it is ordered with cutting and clipping for to grow thick in borders about garden quarters along the allies, also to climbe vpon walls in manner of feeling; and being thus kept down, it is by this means alwaies small and tender. Moreover, thereof are drawne many vi-nets and borders about story-works in colours: for so fine is the leafe, so short and green withal, that it may be brought in a traile to winde about pictures either of hounds and hunters, or of ships and sailers, or any counterfeits and images whatsoeuer most daintily.

Two sorts there are of the Cypresse tree. First that which runneth vp into a pyramidall point, winding vpward as a round spire, which also is called the female. A sfor the male, it sendeth out branches, and spreadeth broad: it is lopped also, and serueth in frames to beare vp vines. Both the one and the other is suffered to grow for perches, railes, and planks, to be made of their boughes when they are cut. Once in thirteene yeares there is made a fall, and not one of those but are sold for a Roman denier apiece. A wood thereof planted in this manner, is of all others most gainfull, and yeldeth greatest profit: insomuch, as in old time they were wont commonly to say, That one fall of such Cypresse poles would yeld a man a portion sufficient to giue with his daughter in mariage.

The Island Candie is the naturall countrey of the Cypresse tree, howsoeuer *Cato* hath called it a Tarentine tree: haply, because it came thither first. In the Isle *Ænaria*, the Cypresse trees spring againe after they be cut downe to the roots. But in Candie, looke what ground soeuer a man dorth breake vp and plough, vnlesse he sow or set it with some other thing, Cypresses will come vp, and presently shew about ground. In many places also of that Isle, they spring and grow of themselves, euen in ground otherwise vntilled; and principally in the mountaines of *Ida*, and those which they cal the white Hills: vpon the very crests and tops wherof, which are alwaies

alwaies couered with snow, they are to be seen in greatesst plenty. A wonderfull thing, considering that in all other places they loue warmth, and without it, will not grow: and besides, when they haue met with a familiar ground vnto them, yet they care not much for it, but disdain so kind a noyce: whereby a man may see, that not onely the nature of the soile, and the ordinarie power of the climat serueth much for these plants, but also certain sudden and temporarie impressions of the aire do wonderfully worke in this case: for some showers there be, that oftentimes do bring seeds with them and ingender plants. The same rains do fall sometime after one certain manner, otherwhiles also in such strange sort, as men are able to giue no reason thereof. A thing that befell the country about Cyrene in Barbary, at what time as the herbe *Laserpitium* (which beareth the gum Benioine) grew there first: as hereafter we will write more at large in our treatise of herbes. Moreouer, about the 430 yere after the foundation of Rome city, there sprung vp a very forest or wood nere vnto the same city, by reason of a certaine thick and glutinous shoure like to Pitch, that then fell.

CHAP. XXXIII.

¶ Of *Iuie*.

It is said, that now the *Iuie* tree groweth also in Asia: and yet *Theophrastus* in his time deliuered the contrary, and a firmest, that neither it was to be found there, nor yet throughout all India, but only vpon the mount *Merus*. Ouer and besides, it is reported, that *Harpalus* did what he could to store the country of Media therewith, but all in vaine. And as for *Alexander* the Great, when he returned from out of India with victory, for the rarenesse thereof he would haue all his soldiers go in a sumptuous shew, wearing chaplets thereof vpon their heads; resembling herein prince *Bacchus*, in solemnities and high feasts of which god, the people of Thracia euen at this day are furnished from this tree, and do with *Iuie* set out and garnish the heads of their launces, pikes, and iauelins, their mourrons also and targuets.

An enemy is *Iuie* doubtlesse to trees, and generally to all plants and sets whatsoeuer it cleaue and breaketh sepulchres built of stone, it vndermineth city walls; good onely to harbour serpents, and most comfortable for their cold complexions: so that I cannot chuse but marvel much that it should be honored at all, and accounted of any worth. But to enter into a more particular consideration and discourse of *Iuie*, two principall kinds are found thereof, like as of all other trees, to wit, the male and the female. The male is described to be a more massiue and greater body, to be clad with a harder and fatter leafe, and to shew a flower inclining to purple: and yet the flower of them both, the male as well as the female, doth resemble that of the wild Rose or Eglantine, saue that it hath no smell at all. These generall kinds containe each of them three particular sorts: for there is the black and the white *Iuie*, and a third besides named *Helix*: and yet we must admit other subdiuisions of these also: for of the white, there is one sort that beareth white fruit only, and another that hath white leaues withall: moreouer, of such as carry only white fruit, one kind hath big berries growing thick together, and bunching round in manner of grapes, which clusters be called of the Greeks and Latines *Corymbi*. A second sort there is of the white *Iuie* named *Selenitium*, which beareth smaller berries, and those not so close set and thick couched together. Semblably, it is to be said of the black: for there is an *Iuy* that beareth also a black grain or seed: another with a fruit of a Saffron colour; and hereof are the garlands made which Poets wear: some call it *Nysia*, others *Bacchica*: the leaues of it are not altogether so blacke, but it beareth the greatest bunches and biggest berries of all the black kind. And verily of this *Iuie* there be some Greeke writers that make two sorts, according to the diuers colors of the berries: for the one they call *Erythranus* [i. the red;] & the other *Chryfocarpus*, as one would say, the golden berry. *Iuie*. Now as touching the rampant or climbing *Iuie*, *Helix*, there be many and sundry sorts thereof, differing in their leafe especially: for first & foremost the leaues of this *Iuie* are small, cornered, and better fashioned than the rest, which indeed are but of a plain and simple making. There is a difference likewise in the length between euery knot and ioint, but especially in this, that it is barren and beareth no fruit at all. And yet some there be, who attribute that to the age, and not to a feuerall kind of *Iuie* by it selfe; saying, that the same which at first was *Helix*, and clasped trees, in tract of time changed the leafe and became a very *Iuie* tree: but foully they are deceiued, and disprooued plainly they may be by this,

That

- A That of the said clasping *Iuie Helix*, there be many kinds, and three principall above the rest. The first, of grasse Greene colour, which groweth most common: the second, with a white leate: and the third, called also the Thracian *Iuie*, which hath leaues of diuers colours. The foresaid Greene *Iuie* is fuller of leaues, and those finer and set in better order than in others; whereas the contrary is to be seen in the white kind: also in the third sort with variety of colours, some haue smaller and thinner leaues, couched likewise in good order, and thicker growing; whereas in the middle kind, no such thing may be obserued. Ouer and besides, the leaues of *Iuie* are bigger or lesse, spotted also and marked; in which regard one differeth from another. Among the white *Iuies*, some be whiter than other. The green *Iuie* groweth most of all others in length: the white killeth trees, for by sucking and foking al the sap and moisture out of them, it feedeth and thrusteth so well it selfe, that it becommeth in the end as big as a tree. A man may know an *Iuie* being come to his perfection by these signes: the leaues are very big and large withall; the tree putteth forth yong shoots straight, whereas in others they be crooked and bend inward: the berries also stand in their clusters directly vpright. Moreouer, whereas the branches of all other *Iuies* be made like vnto roots, this hath boughes strong and sturdy above the rest; and next vnto it, the black kind: howbeit this property hath the white *Iuie* by it selfe, that amid the leaues it putteth forth armes that clasp and embrace the tree round on euery side: which it doth vpon walls likewise, although it cannot so well compasse them. And hereupon it is, that although it be cut asunder in many places, yet it continueth and liueth still: and looke how many such arms it hath so many heads likewise of roots are to be seen, whereby it maintaineth it selfe safe and sound; and is besides of that force, as to suck and choke the trees that it claspeth. Furthermore, there is great diuersity in the fruit, as well of the white as the black *Iuie*. As for the rest, the berries of them are so exceeding bitter, as no bird wil touch them. And yet there is one kind more of *Iuy*, which is very stiffe and standeth alone of it selfe without any prop to beare it vp: and this of all others only, is therupon called *Cissos* or *Iuie*; indeed, Contrariwise, *Chamaecissos*, [i. ground *Iuie*] is neuer knowne but to creep along the ground.

CHAP. XXXV.

¶ Of the Bind-weed or *Iuie* called *Smilax*.

- D Like vnto *Iuie*, is that plant which they call *Smilax*, or rough Bind-weed. It came first out of Cilicia, howbeit more commonly it is to be seen in Greece: it putteth forth stalks set thicke with ioints or knots, and those thrust out many thorny branches. The leafe resembleth *Iuie*, and the same is small, and nothing cornered: from a little stele that it hath, it sendeth forth certain pretty tendrils to clasp and wind about: the floure is white, and smelleth like to a Lilly; it beareth clusters comming nearer to those grapes of the wild vine *Labrusca*, than to the berries of *Iuie*; red of color, whereof the bigger contain within them 3 kernels or pepins apiece, the smaller but one, and those be hard and black withall. This *Smilax* is not vsed in any sacrifices or diuine seruice of the gods, nor serueth for garlands and chaplets: for that it is held to be dolefull and ominous, or of an vnlucky presage, by occasion of a certain yong lady or Damsell, of that name, who for the loue of the yong gallant and knight *Croesus*, was turned into this shrub or plant, retaining still her name: which the ignorant people not knowing, but taking it for a kind of *Iuie*, stick not to make coronets thereof; profaning by that means many times their high feasts and sacred solemnities: and yet who woteth not with what chaplets Poets are crowned, and what garlands prince *Bacchus* or *Silenus* vsed to weare? Of this *Smilax* are made certain manuell writing tables. And this property moreouer hath the wood thereof, That if a man hold it close to his eare, he shall heare it to giue a pretty sound.

But to return againe to the *Iuie* indeed, it hath (by report) a strange and wonderful vertue to trie wines, whether they be delaid with water or no: for make a cup of *Iuie* wood, and put wine thereinto, all the wine will foke and run through, but the water (if any be mingled therewith) will tarry behind.

CHAP. XXXVI.

¶ Of Reeds, Canes, and other water shrubs.

IN this discourse touching plants that loue cold places, it wil not be amisse to treat of those that grow in waters. Among which, the Reeds and Canes may be raunged in the first place:

Tt

for

* For Arrowes
and Darts.
* For writing
pens,
* For Flutes
and Pipes.

for necessarie they be in time both of * war and * peace : they haue their vse besides, and are accepted among the * delightfom pleasures of this world. Moreouer, in the Northern regions, the people vse therewith to couer and thatch their houses: and this kind of rooffe will last many ages, if it be laid with a thick coat, euen vpon high and stately houses. In other parts also of the world, they are wont with it to make their arch-roufes, and hanging floores of most sleight worke. As for Canes particularly, and those of Egypt by name, which haue a certaine resemblance of the Papyr-reed in Nilus, they serue for writing Paper. Howbeit those of Gnidos, and which grow in Asia along the lake or meere of Anaja, be held for the best. As for ours heere in Italy, they are of a more spongeous substance and gristly matter, apt to sucke and drinke vp any liquour. The same within-forth is full of holes and concauities, but conuerted aloft into a fine woody rind, and in time becommeth drie, fast, and hard. Apt it is to cleaue, and the cliffs euer more carry with them a very sharpe edge; and besides, it is full of ioints. Now this woody substance being thus distinctly parted by knots, runneth alwaies euen and smooth, growing smaller and smaller vntill it proue sharpe pointed in the top: with a head consisting of a good thicke downe or plume, which serueth also to right good purposes: for either in stead of feathers they vse to stuffe beds therewith in common Innes; or when it is growne hard and hath a slimie callositie about it, they in Picardie and those Nether-lands do stampe it, and therewith calfet or calke the ioints of their ships, betweene the ribs and planks: and herein it hath no fellow, for it taketh faster hold than any glue, and for filling vp any rifts and chinks, no solder so strong, no pitch so sure and trustie. Of Reeds, the Easterlings make their shafts; and archers they be that fight their battels and determine all quarrels. These shafts they arme with sharpe barbed arrow heads in manner of fish-hooks, which wound with a mischief, because they cannot be drawne out of the body againe: and to make these arrowes flie the faster and kill more presently, they fet feathers vnto them. Now say that a shaft be broken as it is fet fast in the body, that end without the flesh will serue againe to be shor: & so inured are the people in those parts to these kind of weapons, so practised withall in discharging of them so nimbly, that a man seeing how thick the shafts flie in the aire, would say they were a cloud of arrowes that shadowed the very Sun. And therefore when they goe to battell, they wish euer for faire weather and Sunne-shine daies. Windes and raine, as most aduerse vnto their warres, they cannot abide: then are they quiet and rest in peace, full fore against their wils, because their weapons at such a time wil not serue their turne. Certes if a man would fall to an exact reckoning and estimate of Aethyopians, Egyptians, Arabians, Indians, Scythians, and Baetrians, of so many nations also of the Sarmatians, and other East-countries, together with all the kingdomes of the Parthians, hee should finde, that the one moiety or halfe of the world hath been vanquished and conquered by the meanes of arrowes and darts, made of Reedes. The Candiot aboute all others, were so readie and perfect in this kinde of feat, that the ouerweening of their owne skill, and the confidence which they had in this manner of seruice, made them too bold, and was in the end their owne ouerthrow. But herein also, as in all other things: else whatfoeuer, Italie hath carried the name, and woen the prize: for there is not a better Reed growing for to make shafts, than that which is found about the Rhene, a little riuier running vnder Bononia: very full of marrow or pith; stiffe also it is and weightie withall; it cutteth the aire, it flyeth away most swiftly: and last of all, it will hold the owne and stand in the weather so counterpoised, that no winde hath any power on it. And those Reeds in Picardie and the Low-countries, are nothing comparable: ne yet of Candie, how highly soeuer they be commended for warre-seruice. And yet the Reeds that grow in India be preferred before them, and beare the name, which indeede some thinke to be of another nature, considering they bee so firme and bigge withall, that beeing well headed with yron, they serue in stead of Speares and Iauelins. In very truth, the Indian Canes for the most part, grow to the bignesse of Trees, such as we see commonly in Temples, standing there for a shew. The Indians doe affirme, that there is a difference amongst them also, in regard of sexe: and namely, That the substance and matter of the male, is more fast and massie: but that of the female, larger and of greater capacitie within. Moreouer, (if wee may beleue their words) the verie Cane betweene euery ioint, is sufficient to make a boat. These great Canes do grow principally along the riuier Acesine. All Reeds in generall, doe shoot and spring in great number from one root and principall stocke: and the more they be cut, the better they come againe. The root liueth long, and without great iniurie offered vnto it, will not die: it also is di-

uided

A vided into many knottie ioints. Those onely of India, haue short leaues. But in all of them, the leafe springeth out of the ioint, which embracing the Cane, doth clad it round about with certaine thin membranes or tunicles, as far as to the middle space between the ioints; and then for the most part they giue ouer to claspe the Cane, and hang downward to the ground. As well Reeds as Canes, spread their leaues like wings round one after another, on either side vpon the very ioints, and that in alternatiue course alwaies very orderly; so as if the one sheath come forth of the right side, the other at the next ioint or knot about it, putteth out on the left, and thus it doth throughout by turnes. From these nodosities, otherwhiles a man shall perceiue as there were certaine little branches to breake forth, and those bee no other but small and slender Reeds.

B Moreouer there be many kindes of Reedes and Canes: for some of them stand thicker with ioints, and those are more fast and solid than others, & small distance there is between the same: there be again that haue not so many of them, and greater space there is from the one to the other, and such Canes for the most part are of a thinner substance. Yee shall haue a Cane all full of holes within, called therupon Syringias; and such are very good to make whistles or small flutes, because they haue within them neither gristly nor fleshy substance. The Orchomenian Cane is hollow throughout from one end to the other, and this they call Auleticus, or the pipe Cane, for as the former was fit for flutes, so is this better for great pipes. Now you shall meet with Canes also that stand more of the wood, & haue but a narrow hole and concauity within; and this is full of a spongeous pith or marow within-forth. Some be shorter, some longer than other, and where you haue one that is thin and slender, you shall spie a fellow to it more grosse and thicker. That which brancheth most, & putteth forth greatest store of shoots, is called Donax, and is neuer known to grow but in marishes and watery places (for herein also lieth a difference) and preferred it is far before the Reed that commeth vp in dry ground. The archers reed is a severall kind by it selfe (as we haue shewed before;) but of this sort, those in Candy haue the greatest spaces betweene euery ioint; and if they be made hot, they are very pliable, and will bend and follow which way soeuer a man would haue them.

Moreouer, Reeds are distinguished one from another by the leafe, not for the number, but the strength and colour. The leaues of those about Lacedaemon, * are stiffe and strong, growing thicker of the one side than of the other. And such as these are thought generally to grow a-
D long standing pooles and dead waters, far vnlike to those about running riuers: and besides, to be clad with long pellicles, which claspe and climbe about the Cane higher about the ioint, than the rest doe. Furthermore, there is another kind of Reeds that groweth crooked and winding trauers, and not vpright vnto any height, but creeping low toward the ground, and spreading it selfe in manner of a thrub. Beasts take exceeding great delight to feed thereof, and namely, when it is young and tender, for the sweet and pleasant taste that it hath. Some call this Reed, Elegia.

E Ouer and besides, there breedeth in Italy also among the fens, a certain salt some, named * A-
darca, sticking to the rind or vtmost barke of Reedes and Canes, onely vnder the verie tuft and head: passing good it is for the tooth-ach, by reason of the hot and caustick quality that it hath like to Senuie or Mustard-seed. As touching the Reed-plots about the Orchomenian lake, I must needs write more exactly, considering in what admiration they were in times past: for in the first place, they called that Cane which was the thicker and more strong, Characias; but the thinner and more slender, Plotia. And this verily was wont to be found swimming in the Islands that floted in the said lake; whereas the other grew alwaies firme vpon the bankes and edges thereof, how farre soeuer it spread and flowed abroad. A third sort also there is of Canes, which they called Auleticon, for that it serueth to make flutes and pipes of: but this commonly grew but euery ninth yeare: for the said lake also kept that time just, and increased not about that terme; but if at any time it chanced to passe that time and to continue full two yeres together more than ordinary, it was holden for a prodigious and fearfull signe. The which
F was noted at Chironia, in that vnfortunate battell wherein the Athenians were ouerthrowne and defeated: and many times else is obserued to happen about Lebadia, namely when the Riuier Cephissus ariseth so high, that he swellth ouer his bankes, and is discharged into the said lake. Now during that ninth yeare (whiles the inundation of the lake continueth) these Canes prouue so bigge and strong withall, that they serue for hawking poles, and fowlers peaches:

T t 2

and

* Paria, or Per-
ficolor, minima,
Therph. i. of
diuers colours.

* Calamachne.

and then the Greeks call them Zeugitæ. Contrariwise, if the water hold not so long, but do fall and return back within the yere, then the Reeds be small and slender, named Bombyciæ. Howbeit the femals of this kind, haue a broader and whiter leafe, little or no down at all vpon them, and then they are known by a pretty name and called Spadones, as one would say guelded. Of these Reeds were made the instruments for the excellent close musick within-house: wherein, I cannot passe with silence, what a wonderfull deale of paines and care they tooke to fit them for their tune, and make them to accord: insomuch, as we are not to be blamed but born withall, if now adaies we chuse rather to haue our pipes and hautboies of siluer. And in truth, to the time of *Antigenes* (that excellent minstrell and plaier vpon the pipe) all the while that there was no vse but of the plain musick and single instrument; the right time of cutting down & gathering these Reeds for this purpose, was about September, when the signe *Arcturus* is in force: then were they to haue a seasoning and preparation for certaine yeares, before they would serue the turne; yea and then also much ado there was with them, and long practise and exercise they asked, before they could be brought into frame and good tune: so as a man might wel say, that the very pipes were to be taught their sound and note, by meanes of certaine tongues or quills that struck and pressed one vpon another; and all to giue contentment and shew pleasure vnto the people assembled at Theatres, according as those times required. But after that musicke came once to be compound, and that men sung and plaied in parts with more varietie and delight, they began to gather these Reeds before mid-Iune, and in three yeares space they had their perfection and grew to their prooffe; then were those tongues or holes made more wide and open, for to quauer and change the note the better: and of such are the flutes and pipes made, which be vsed at this day. But in those times men were persuaded, that there was a great difference in the parts of any Reeds for to serue these or those instruments: in such sort, as that ioint which was next vnto the root, they held to be meeter for the Base pipe that was fitted for the left hand, and contrariwise for the Treble of the right hand, those knots that were toward the head & top of the Reed. Howbeit of all others, by many degrees were those preferred which grew in the riuer *Cephissus*. Now adaies, the hautboies that the *Tuscans* play vpon at their sacrifices, be of Box-wood; but the pipes vsed in plaies for pleasure only, are made of the *Lotos*, of *Asses* shank-bones, and of siluer. The best *Faulconers* Reeds wherewith they vse to chase foules, came from *Panhormus*: but the Canes for angle-rods that fishers occupie, are brought out of *Africk* from *Abaris*. The Italian Reeds & Canes be fittest for to make perches to lay ouer frames, & props for to beare vp vines. Finally, as touching the setting of Reedes, *Cato* would haue them to be planted in moist grounds, after they haue bin first delued & laid hollow with a spade; provided alwaies that the oellets stand 3 foot asunder, and that there be wilde *Sparages* among, whereof come the tender crops for fallads; for those like well and sort together with the Canes.

CHAP. XXXVII.

¶ Of the Willow or Sallow, eight kinds thereof: and what trees besides the Willow are good for bindings. Also of Briers and Brambles.

Moreouer (after the opinion of the said *Cato*) it is good to plant Withies also about riuer sides, and neere to Reeds: for surely there is not more profit arising from any other tree of the waters, than from it; howsoeuer the *Poplars* are well liked and loued of the vines, and do nourish the good wines of *Cæcubum*: howsoeuer the *Alders* serue in stead of rampiers and strong fences against the inundation and ouerflowing of riuers, withstanding their forcible eruptions; howsoeuer they stand in the waters as mures and wals to fortifie the banks, or rather as sentinels to watch and ward in the borders of country farms; and being cut down to the root, do multiply the rather, and put forth many shoots and imps as heires to succeed. And to begin withall, of *Sallowes* there be many kinds: for some there be, that in the head beare perches of a great length to prop and make trails for vines to run vpon: and the rind or skin as it were pilled from the wood, is as good as a belt or thong to binde or gird any thing withall. Others againe there are, and namely the red Willows, which carry twigs and rods that are pliable and gentle to wind as a man would haue them; fit also for buildings. Ye shal haue of these *Osiers*, some that are very fine & passing slender, wherof are wrought pretie baskets, and many other dainty deuises; others also that are more tough and strong, good to make paniers, hampers, and a thousand other

- A** other necessary implements for country houses, and to fit the husbandmen. Being pilled, they are the fairer and whiter, more smooth also and gentle in hand, whereby they are excellent good for the more delicate sort of such wicker ware, and better far than stubborn leathers; but principally for leaning chairs, wherein a man or woman may gently take a nap, sitting at ease and repose most sweetly. A willow, the more that it is cut or lopt, the better spring will it shoot at root, and beare the fairer head. Let that which you cut or shred, be so little & short withall, that it resemble a mans fist, rather than a bough, the thicker will it come again: a tree no doubt that would not be set in the lowest rank, but be wel regarded, how soeuer we make but baste reckoning thereof: for surely there is not a tree for reuennue and profit, more safe and certain; for cost, lesse chargeable; and for injury of weather, in better security. Certes, *Cato*, among the commodities that commend a good ferm or manor, esteemeth it in the third place, and preferreth the increase and benefit thereby, before the gain that groweth from oliue rows, corn fields, & good meadows. Yet hereof we must not infer, that we are not furnished with many other things which wil serue for bands to bind withall; for we haue certain sorts of *Spart* or *Spanish broom*, we haue *Poplars*, *Elmes*, the *Sanguine-thrubs*, *Birch*, clouen Reeds, leaues of *Cane*; as for example in *Liguria*: the cuttings also of the very *Vine*, and *Briars*, so their sharp prickles be cut away, to tie withall; yea and the *Hayell wands* also, so they be writen and twined: wherein a man may see a wonderful property, That a wood should be stronger for to bind withall, when it is crushed and bruised, than whiles it was entire and sound. All these (I say) are good for bands, and yet the willow hath a gift therein beyond all the rest. The Greek willow is red, and commonly is sluken for to make withs. The *Amerian Osier* is the whiter, but more brittle, and soon wil crack, & therefore it is put to that vse of binding sound and whole as it groweth, and not clouen through. In *Asia*, they make account of three sorts of willows: the black, which they imploy to wind and bind withall, so tough and pliant it is; the white, wherewith husbandmen make their wicker paniers and baskets, with other such vessels for their vse; as for the third, it is the shortest of all other, and they call it *Helix* or *Helice*. With vs also here in *Italy*, there be as many kinds, & those distinguished by their seuerall names; the first, which is of a deep purple colour, they call the free osier or willow; and that is so good for bands: the second, which is more thin and slender, is named *Vitellina*, [or *Vitellinam* rather, for the yellow colour of the yolke of egges,] for the bright hew that it hath: the third that is smallest of all three, is the French willow.
- D** To come now to the brittle Rushes that grow in marsh grounds, which serue to thatch houses and to make mats; and the pith whereof when the rind is pilled, maketh wicke for watch-candles, and funerall lights to burne by a dead corps whiles it lieth aboue ground, they cannot iustly be reckoned in the ranke either of shrubbes, or Brier-bushes, and Brambles, ne yet of tall plants growing vp with stems and stalks, no more than among Hearbes and Weeds creeping along the ground; but are to be counted a seuerall kind by it selfe. True it is, that in some places there are to be found rushes more stiffe, hard, and strong, than in others. For not onely mariners and watermen in the riuer *Po* do make sailes thereof, but fishermen also of *Africk* in the maine sea; howbeit they hang their sailes betwene the masts, from mast to mast, after a preposterous manner contrary to all other. The *Mores* also do couer their cottages with *Bulrushes*; and surely if a man looke neerly to the nature of them, they may seeme to serue for that vse which the *Papyr-reeds* in the netherland of *Ægypt* are put vnto, about the descent and fall of the riuer *Nilus*.
- E** As touching Brambles, they may go among the shrubs of the water: so may the *Elders* also, which consist of a spongy kind of matter, & yet cannot wel be counted among those plants which bee termed *Fencels-gyant*: for surely the *Elder* standeth more vpon the wood than they do. The shepherds are verily persuaded, that the *Elder* tree growing in a by-place farre out of the way, and from whence a man cannot heare a cock crow out of any town, maketh more shrill pipes and louder trumpes than any other. The Brambles beare certaine berries like the *Mulberries*, euen as the sweet Brier of another kind, which they call *Cynosbatos* or the *Eglantine*, carrieth the resemblance of a *Rose*. A third sort there is of brambles, which the Greeks call *Idea*, of the mountaine *Ida*. This is the *Raspis*: smaller it is and more slender than the rest, with lesse prickles vpon it, and nothing so sharpe and hooked. The floure of this *Raspis* being tempered with hony, is good to be laied to bleared and bloud-shotten eies; as also to the wild-fire, or disease called *Saint Antonies fire*. Being taken inwardly, and namely drunk with water, it is very com-

comfortable to a weake stomacke. The Elder beareth certain blacke and small berries, full of a grosse and viscous humor, vsed especially to die the haire of the head black. If they be boiled in water they are good and wholsome to be eaten as other pot-herbs.

C H A P. XXXVIII.

¶ *Of the iuice or humor in trees. The nature of their wood and timber. The time and manner of felling and cutting downe trees.*

Trees haue a certaine moisture in their barks, which we must vnderstand to be their very bloud, yet is it not the same nor alike in all: for that of the Fig trees is as white as milke, and as good as rendles to giue the forme to cheese. Cherry trees yeeld a glutinous and clammy humor, but Elmes a thin liquor in manner of spittle. In Apple trees the same is fattie and viscous; in Vines and Pyrries waterish. And generally, those trees continue and liue longest, that haue such a glewy moisture in them. In summe, there are to be considered in the substance and body of trees, like as of all other liuing creatures, their skin, their bloud, flesh, sinues, veins, bones, and marrow. For in lieu of their hide is the barke. And I assure you, a strange and maruellous thing it is to be obserued here in the Mulberry, that when Physitians seek to draw the foresaid liquour out of it, at seuen or eight a clocke in a morning, if they scarifie or lightly cut the bark with a stone, it issueth forth, and they haue their desire: but if they crush or cut it deeper in, they meet with no more moisture than if it were stark dry. In most trees next to the skin lieth the fat: this is nought else but that white sap which of the colour is called in Latin Albumum. As it is soft in substance, so is it the worst part of the wood; and euen in the strong oke, as hard as otherwise it is, ye shal haue it soon to putrifie and rot, yea and quickly be worm-eaten. And therefore if a man would haue found and good timber, this white must be alwaies cut away in the squaring. After it followeth the flesh of the tree; and so the bone, which is the very heart and best of the wood.

All trees whereof the wood is ouer dry, beare fruit but each other yeare, or at leastwise more in one yeare than another, as namely the Oliue tree: a thing obserued more in them than in those that haue a pulposus and fleshy substance, as the Cherry tree. Neither are all trees indifferently furnished with store of the said fat or flesh, no more than the most fierce and furious beasts. As for the Box, Cornel, and Oliue trees, they haue neither the one nor the other, ne yet any marrow at all, and but very little bloud. Semblably, the Seruis tree hath no heart, the Alder no carnositie, (and yet both of them are stored wel enough with marrow, which is their pith) no more than canes or reeds for the most part. In the fleshy substance or wood of some trees there are to be found graine and veine both. And easie it is to distinguish the one from the other: for commonly the veins be larger and whiter; contrariwise the grain, which the Latines call Pulpa, runneth streit and direct in length, and is to be found ordinarily in trees that wil easly cleaue. And hereupon it commeth, that if a man lay his eare close to one end of a beame or piece of timber, he shall heare the knocke or pricke that is made but with a pen-knife at the other end, be the piece neuer so long, by reason that the sound goeth along the streit grain of the wood. By this means also a man shall find when the timber doth twine, and whether it run not euen, but be interrupted with knots in the way.

Some trees there be that haue certain hard bunches bearing out and swelling like to kernels in the flesh of a Swines necke: and these knobs or callosities haue not in them long grain and broad veine, as is aboue said, but only a brawny flesh (as it were) rolled round together: And to say a truth, when such knurres and callosities as these be, are found either in Citron or Maple trees, men make great account of them, and set no small store by that wood. All other sorts of Tables, when the trees are clouen or sawne into planks, are brought into a round compasse with the grain: for otherwise, if it were slit ouerthwart to make them round against the grain, it would soon breake out. As touching the Beech, the graine of it runneth crosse two contrary wayes like combe teeth; but in old time the vessels made of that wood were highly esteemed. As for example, *Manius Curius* hauing subdued his enemies, protested, and bound it with an oath, That of all the booty and pillage taken from them, hee had not reserued any thing for himselfe, but only a cruet or little Ewer of Beech wood, wherein he might sacrifice vnto the gods.

There

A There is no wood but floteth aloft the water, and waueth in length: like as that part which is next to the root is far more weighty, setleth faster downe and sinketh. Some wood hath no veins at all, but consisteth only of a meere grain, streight and small in maner of threds, & such commonly is easie to be clouen. There is again wood that hath no such direct graine, and that will sooner breake out than cleaue; and of this nature is the Oliue and Vine-wood. Contrariwise, the whole body and woody substance of the Figge tree is nothing but flesh. The Mast-holme, Cornel, Oke, Tretifolie, Mulberry, Ebony, and Lotus, which haue no pith and marrow within, as is before said, are all heart. All wood for the most part turneth to a blackish colour. The Cornel tree is of a deep yellow, whereof are made the faire Bore-speare staues, which shine again, and be studded (as it were) with knots, and chamfered betweene both for decencie and handsonnesse. The Cedar, Larch, and Iuniper wood is red.

C H A P. XXXIX.

¶ *Of the Larch tree, the Firre, and the Sapine: the manner of cutting or felling such like trees.*

There is a female Larch tree which the Greeks call *Ægis*: the wood whereof is of a pleasant colour, like to hony. Painters haue found by experience, that it is excellent good for their tables, both for that it is so euen and smooth, not apt besides to chink and cleaue: as also because it will endure and last for euer. And that part they chuse which is the very heart of it, and next the pith, which in the Fir tree the Greekes call *Leufon*. In like sort the heart of the Cedar is hardest which lieth next to the pith or marrow aboue named (much after the manner of bones in the bodies of liuing creatures) when the muddy carnositie is scraped off and taken away. The inward part also of the Elder by report is wondrous hard & tough, and they that make thereof staues for Bore-speares prefer it before any wood whatsoeuer. For it standeth only vpon skin and bone, that is to say, of the rind and heart.

As touching the falling and cutting downe of trees, to serue either in temples or for other vses, round and entire as they grow, without any squaring; as also for to barke them, the onely time and season is, when the sap runs, and that they begin to bud forth: otherwise you shal neuer be able to get off their bark: for bark them not, they wil rot and become worm-eaten vnder the said barke, and the timber withall waxe dusky and blacke. As for the other timber that is squared with the axe, and by that means rid from the barke, it would be fallen or cut downe between mid-winter and the time that the wind *Favonius* bloweth: or, if we be forced to vse the timber before, and to prevent that time, trees may be fallen at the setting of the star *Arcturus*, or of the *Harp*-star before it. Finally, the utmost and last time thereof is at the summer Sunnest. But forasmuch as most men be ignorant of these seasons, and know not when these starres aboue named do either rise or fall, I will hereafter shew the reason both of the one and other in place conuenient. For this present, as touching the time of felling trees, the common sort make no more scruple, but thinke it sufficient to obserue, that no trees which are to be hewne square for carpenters work be cast down and laid along before they haue borne their fruit. As for the hard and sauge Oke, if it be felled in the spring it will be subiect to the Worme: but cut it down in mid-winter, it will neither warpe, ne yet cleaue and chink: being otherwise subiect vnto both, namely, as well to cast and twine, as to rift and gape: a thing incident to the Cork wood, be it cut down in as good a season as is possible. Moreouer, it passeth to see how much the age of the Moon auaileth in this case: for it is commonly thought that timber would not be fallen but in the wain and namely in the last quarter, from the 20 day of the Moon, till the thirtieth. And this is generally received among all good workmen, That the best time to cut downe any timber, is in the coniunction of the Moon with the Sun, euen in the very day of the change, before she sheweth new. *Cerres Tiberius Cesar* the Emperor gaue order to fel the Larch trees that came out of *Rhoetia*, to repaire and re-edifie the bridge that serued to represent the shew of a naual battell vpon the water (which fortun'd to be consumed with fire) iust at the change of the Moon. Some say, that we must precisely obserue the point of the conjunction, and that the Moon withall be vnder the earth, when such trees should be felled: which cannot be but in the night. But if it fall out besides, that this conjunction or change of the Moone, and the last day of the Winter Sun-head meet together at one instant; the timber then cut downe will last a

Theophrastus writeth this of the Cornel tree.

world

world of yeares. Next vnto it is that timber which is fallen in the daies and signes aboute rehearted. Others affirme moreouer, that the rising of the Dog-star would be considered and chosen for this purpose: for at such a time was that timber felled which serued for the stately hall or pallace of *Augustus*. Moreouer, for to haue good and profitable timber, the trees would be cut down that are of a middle age, for neither yong poles nor old runts are fit for durable building. Furthermore, there be that hold opinion, that for to haue the better timber, the trees should haue a kerse to the very heart and pith round about, and so let it stand an end still, that all the humor by that means might run out, before they be ouerthrowne and laid along. And verily a wonderfull and miraculous thing is reported in old time, during the first Punicke war against the Carthaginians, namely, that all the ships of that fleet which was conducted by General *Duellius* the high Admiral, were shot into the sea and vnder saile, within sixty daies after the timber wherof they were built was cut downe in the wood. And *L. Piso* hath left in writing, That against king *Hiero* there were 220 ships made & furnished in 45 daies after the timber grew. Also in the second Punicke war, the Armado which *Scipio* imploied, was set afloat and bare saile forty daies after the fall of the timber. See how forcible and effectuell in all things is the season and opportunitie of time duly taken, especially when need driueth to make speed and hasten apace.

Cato the chiefe and only man of all others for experience and knowledge in euery thing, in his treatise of all kind of timber to be imploied in building, giues these rules following. Make thy pressing plank especially of the black * *Sapine* or Horn-beam tree. *Item*, Whensoever thou meanest to stoke vp either Elme, Pine, Walnut tree, or any other whatsoeuer for timber, see thou dig it out of the ground, in the wane of the Moon, and that in the afternoon, and take heed in any wise that the wind be not South. *Item*, The right season to fell a tree for timber, is when the fruit is full ripe. *Item*, Beware in any case, that thou neither draw forth of the ground, nor yet square a tree when the dew falleth. And a little after: Beware thou meddle not with timber trees but either at the change or full of the Moon. And in no hand, neither stork it vp then, nor hew it hard to the ground. But within foure daies after the full Moone, plucke vp trees hardly, for that is the best time. *Item*, Be well aduised, that thou neither fell, square, nor touch with the ax, any timber that is black, ylesse it be dry. And meddle not with it, if either it be frozen or full of dew. *Tiberius* the Emperour aboue named obserued likewise the change of the Moon, for cutting the haire both of head and beard. And yet *M. Varro* gaue a rule, That to prevent baldnesse and the shedding of haire, the Barber should be sent for alwaies after the full Moon.

But to come again vnto our timber trees: The Larch and Fir both (but the Fir especially) if they be cut down, bleed a long time after, and yeeld abundance of moisture. Indeed, these twain of all others be the tallest, and grow most streight and vpright. For Mast-poles and crosse saile-yards in ships, the Fir or Deale is commended and preferred before all other, for the smoothnes and lightnesse withall. The Larch, the Fir, and the Pine haue this propertie common to them all, To shew the graine of their wood running either parted in foure, forked in twaine, or single one by one. For fine carpentry and Ioiners feeling within house, the heart of the tree would be clouen or rent. The quarter timber, or that which runneth with foure grains, is simply the best, and more pleasant to be wrought than the rest. They that be skilfull woodmen, and haue experience in timber, wil soon find at the first sight the goodnes of the wood by the very bark. That part of the Fir tree which groweth next to the earth is without knots, euen and plain: the same is laid to foke and season in the water, and afterwards the barke is taken off, and so it commeth to be called *Sapinus*. The vpper part is knotty, and harder than the nether, and the Latins name it *Fufterna*. In sum, what tree soeuer it be, that side which regardeth the North is more strong and hard than the other. And generally, the wood of those trees that grow in moist and shady places is worse: contrariwise, that which commeth from ground exposed to the Sun-shine is more fast and massie, and withall endureth a long time. And herupon it is, that at Rome the Fir trees that come from the nether sea side out of Tuscane, be in better request than those from Venice side, vpon the coast of the vpper sea.

Moreouer, there is great ods between Firre trees, in regard of diuers Countries and Nations where they grow. The best are those of the Alps and the Apennine hills. Likewise in France there are excellent good Firs vpon the mountains Iura and Vogesus: as also in Corsica, Bithinia, Pontus, and Macedonia. A worse kind of them grow in Arcadia and about the mountains neere

A neare *Anea*. The worst be those of *Pernassus*, & *Euboea*: for in those parts they be full of boughs and grow twined, besides, they soone doe putrifie and rot.

As for Cedars, the best simply be those that grow in Candy, Affricke, and Syria. This vertue hath the oile of Cedar, That if any wood or timber be thoroughly anointed therewith, it is subiect neither to worme nor moth, ne yet to rottenesse.

The Juniper hath the same propertie that the Cedar. They proue in Spaine to be exceeding big and huge, the Berries also greatest of all others. And wheresoeuer it grows, the heart thereof is more found than the Cedar.

A generall fault and imperfection there is common to all wood, When the graine, and the knots run into round balls, and such they call in Latin *Spiræ*. Also in some kind of timber, like as in marble also there be found certaine knurs like kernils, as hard they be as naile heads, and they plague sawes, wheresoeuer they light vpon them. Otherwhiles they fall out to be in trees, by some accidental occasion, as namely, when a stone is got into the wood, and enclosed within it: or, in case the bough of some other tree be incorporat or vnited to the foresaid wood. There stood a long time a wild Oliue in the market place of Megara, vpon which the hardie and valiant warriors of that citie vsed to hang and fasten their armor, after some worthy exploit performed: which in tract and continuance of time were ouergrown with the bark of the said tree, and quite hid. Now was this a fatal tree vnto the same city and the inhabitants thereof, who by way of Oracle were forewarned of their wofull destiny and vtter ruin, which was to happen. When that a tree should be with yong, and deliuered of harneis: which Oracle was fulfilled when this tree was cut downe, for within the wombe thereof were found the mourrions, jambriers, or grieues, of braue men in times past. To conclude, it is said, That such stones so found in trees be singular good for a woman with child, to carie about her, that she may goe her full time.

CHAP. XL.

¶ Of diuers sorts of timber. Of some trees of extraordinarie bignesse. What trees they be that neuer be worme-eaten, nor decay and fall. What wood doth endure and continue a waies good.

THE greatest tree that to this day had euer been knowne or seene at Rome, was that, which being brought with other timber for the rebuilding of the foresaid bridge called *Nau-machiaria*, *Tiberius Caesar* commanded to be landed and laid abroad in view for a singular and miraculous monument to all posteritie: and it remained entire and whole, vntill the time that *Nero* the Emperour built his stately Amphitheatre. This peece of timber was of a Larch tree: it contained in length 120 foot, and caried in thicknesse euery way two foot, from one end to the other. Whereby a man may guesse and judge the incredible height of the whole tree besides, to the very top. Such another tree there was to be seen in our daies, which *M. Agrippa* left for the like singularity and wonder of men, in those stately porches and cloisters that hee made in *Mars* field: and it continued still after the building of the muster place and treasurers hall named *Diribitorium*. Shorter it was than the former by 20 foot, and caried a foot and half in thicknesse. As for the Fir tree, which serued for a mast in that huge ship, which by the commandement and direction of *C. Caligula* the Emperour transported and brought out of *Aegypt*, that Obelisk which was erected and set vp in the Vatican hill, within the cirque there, together with the foure entire stones which bare vp the said Obelisk as supporters; it was seen of a wonderfull and inestimable height aboue all others: and certaine it is, that there was neuer knowne to float vpon the sea a more wonderful ship than it was. She receiued 120000 Modij of Lentils for the very ballast; she tooke vp in length the greater part of the left side of *Hostia* harbour: for *Claudius* the Emperour caused it there to be sunk, together with three mighty great piles or dams founded vpon it, and mounted to the height of towers, for which purpose there was brought a huge quantity of earth or sand from *Puteoli*. The maine bodie of this mast contained in compasse 4 fadom full. And a common by-word it is, currant in euery mans mouth, that Fir mast for that purpose, are vually sold for eight hundred Sesterces a peece, and more monie: whereas for the most part planks which are set together and serue in stead of boars, ordinarily cost but forty. Howbeit, the kings of *Egypt* and *Syria*, for default and want of Fir (haue vsed by rep ort) in stead thereof Cedar wood about their shipping. And verily, the voice goes of an exceeding

ceeding big one which grew in Cyprus, and was cut downe for a mast to serue that mighty gal-
leace of king *Demerius*, that had eleuen bankes of oares to a side; a hundred and thirtie foot it
was high, and three fatham thicke. And no maruell, since that the pyrats and rousers, who haunt
the coasts of Germanie, make their punts or troughs of one entire peece of wood and no more,
wrought hollow in manner of a boat, and some one of them will hold thirtie men.

To proceed now vnto the sundry natures of wood. The most massie and fast wood, and there-
fore the weightiest of all other, by judgment of men, is that of the Ebene and the Boxe: both
small trees by nature. Neither of them twaine swims aboue the water, no more will the Corke
wood, if it be barked, nor the Larch. Of all the rest, the saddest wood is that of Lotus, I meane
that which at Rome is so called. Next to it, is the heart of Oke, namely, when it is rid of the
white sappie wood: the heart (I say) which comes neare to a black color; and yet the Cytisus or
Tetrifolice is blacker, and seemeth most to resemble the Ebene. Howbeit, you shall haue some
who affirme that the Terebinth of Syria be blacker than it. There was one *Thericles* a famous
Turner, who was wont to make drinking cups, mazers, and bowles of the Terebinth; which is a
sufficient prooffe, that the wood is fine and hard. This wood alone of all others, louth to be oi-
led, and surely the better it is for the oile. But a maruellous prety deuice there is to set a passing
faire blacke color, and a shining glosse vpon it; with Walnuts and wild Peares, namely, boiling
these together, and making thereof a mixture and composition to giue the said tincture. All
these trees abouenamed haue a sad and fast wood. Next to them in that respect is the Cornell
tree: and yet I cannot properly range it in the order of timber trees, so small and slender it is.
Neither is the wood thereof in manner good for nought else but for spokes in cartwheels, also
to make wedges to cleaue wood, and tough pins, that will hold as fast well neere as yron spikes. In
like sort, the Mast-helm, the Oliue both wild and tame, the Chestnut tree, the Hornbeam, and
the Poplar, be of an hard substance, and meet for this purpose. The wood hereof hath a curled
graine like the Maple, and surely would be as good timber as any, but for often lopping the
boughs, which gueldeth and deminisheth the strength. Moreouer, many of them there bee, and
the Oke especially, so hard, that vnlesse they be foked first in water, it is impossible to bore a
hole into them with an auger, or to pluck forth a nail if it be once set fast, water them as much
as you will. Contrariwise, the Cedar will not hold a nail. The wood of the Linden tree seemes
of all other to bee most soft, and hottest withal: for prooffe whereof, this reason men doe alleadge,
because it soonest turnes and dulles the axe edge. Of a hote nature also are the Mulberrie tree,
the Lawrell, and the Yvie, and in one word, all those that serue to strike fire with. This experi-
ment was first found out by spies, that goe between camp and camp, by shepheards also in the
field: for hauing not flint euermore readie at hand to smite and kindle fire withall, they make
shift for to rub and grate one wood against another, and by this attrition there fly out sparkles,
which lighting vpon some rinder, made either of drie rotten touchwood, or of bunts and wither-
ed leaues, very quickly catch fire, and burne not out. And for this intent, there is nothing bet-
ter than to strike the Yviewood, with the Bay. In this case also the wilde Vine (I mean not La-
brusca) is much commended: and it climbeth and runneth vpon trees in manner of Yvie.

The trees that grow in waterie grounds be coldest of all others: but such be toughest and
therefore best to make bucklers & targuets, the wood whereof, if it be cut, comes quickly toge-
ther, and closes vp the gash againe, and in that regard, much adoe there is to pierce it thorough
with any weapon whatsoever. And of this sort are Fig trees, Willowes, Lindens, Birch, Elder,
Ash, and Poplar. Of all these, the Fig tree and the Willow be lightest, and therefore fittest for
that purpose. These trees last rehearsed, be good for caskets and foffers; wicker baskets also and
prettie paniers, which be made of winding twigs. Their wood besides is faire & white, streight
also and easie to be grauen. The plane wood is soft and gentle, but moist withall; and so is the
Alder. Elme likewise, Ash, Mulberry, and Cherry-tree wood, is pliable, but drier and more pon-
derous. The Elme, of all kinds of wood, will keep streight and stiffe best, and not warp at all: &
because it twines and casts not, it is passing good for hinges and hooks, for sawne bords for led-
ges in dores and gates, so as this regard be had of exchange, that the vpper end of the bord that
grew toward the head of the tree, be fitted to the nether hinge or hooke of the dore; and con-
trariwise the butt end, serue the higher. The Date tree and the Corke, haue a soft and tender
wood. The Apple tree, Pear tree, and Maple, haue as sad and massie; but brittle it is, like as
all wood that goeth with a crosse and frised grain. And look what tree soeuer is naturally hard
and

A and tough, the wild and the male of the same kind, haue their wood more churlish than other-
wise it is in the rest. Semblably, those that beare no fruit, are of a faster and firmer wood than
the fruitful: vnlesse it be that that the males be bearers and the female barren, of which sort are
the Cyresse and Cornell trees. The wood of Cyresse, Cedar, Ebene, Lotus, Box, Yewgh, Lu-
niper, and the Oliue both sauage and gentle, is neuer worme-eaten, ne yet rotteth for age. As for
all other trees, long it is before these decay, to wit, the Larch, the Oke, the Corke tree, Chestnut
and Walnut tree. The Cedar, Cyresse, and Oliue wood, neuer doth chinke or cleaue of it self,
vnlesse it be by some accident.

It is commonly thought, that the Box, the Ebene, the Cyresse, and the Cedar wood, is euer-
lasting and will neuer be done. An euident prooffe thereof as touching all these sorts of timber,
by the judgment and choise of so many men, was to be seene in that famous temple of *Diana* in
B Ephesus: for al Asia set to their helping hand and contributed toward that work, which in foure
hundred yeres and not before, they brought to an end & finished. The beames, rafters, and spars
that went to the making of the rouse, were by the generall voice of the whole world, of Cedar
timber. As touching the statue or image it selfe of the goddesse *Diana*, it is not certainly known
of what wood it was: all writers, saue only *Mutianus*, report that it was of Ebene. As for him, a
man who had been thrice Consull of Rome, and one of the last who vpon their owne sight of
the said thing, wrote thereof, auoucheth that it was made of Vine wood; and that, howsoeuer
the temple was ruined and rebuilt againe no lesse than seuen times, yet the foresaid image was
neuer altered nor changed. Who saith moreouer, that *Caenias* chose that wood for the best (for
so he named the workman that cut and carued it.) And I much maruel therat, considering that
C by his saying this image was of greater antiquity than that of lady *Ameria*, much more than of
prince *Bacchus*. He addes moreouer and saith, that this statue was embawled within, by reason
of the precious oile of Spiknard, which was distilled into it at many holes: by means of which
medicinal liquor, the wood was nourished, and the joints held close and fast together, where-
at I cannot chuse but maruell againe very much, that considering the statue was so small, it should
haue any peece or joint at all. Now as touching the leaues of the dores belonging to this tem-
ple, they were by his report, of Cyresse wood: and continued still fresh and new to the eye, not-
withstanding it is foure hundred yeres well neere since they were made. Where, by the way
this is to be noted, that these dores stood foure yeres glewed in the cleaue. And verily, this wood
was chosen for that purpose, because among other properties, the Cyresse alone hath the gift,
D to looke alwaies shining and polished, and neuer loseth the glosse and beauty. And for to prooue
this, we need not to goe farre: Looke but vpon the emage of * *Vejouis*, in the Capitoll, made of
Cyresse wood, doth it not endure still faire and trim? and yet was it dedicated and consecra-
ted in that temple, in the yeare after the foundation of Rome, 551.

A famous and memorable temple there is of *Apollo* at Vtica, where the beames and maine
peecees of timber, made of Numidian Cedars, remaine as whole and entire as at the first day
when they were set vp, which was when the citie was first founded: by which computation, they
haue continued alreadie 1188 yeres. Moreouer, it is said, that at Saguntum a citie of Spaine,
there is a temple of *Diana* still standing, a little beneath the citie: and yet as king *Burchus* mine
Author saith, 200 yeres before the ruine and destruction of Troy, the same men that brought
E the image of the said *Diana* from the Island Zacyntus, founded the temple abouesaid. For the
antiquity and religion whereof, *Annibal* made some conscience to demolish it, and would not
once touch it: and therein are to be seen at this day the beames and rafters of Luniper, sound and
good. But aboue all other, memorable is the temple of the said goddesse *Diana* in Aulis, which
was built many hundred yeres before the Trojan war: but what kind of timber was employed
about the Carpentrie thereof, is not well knowne. Howbeit, this we may boldly resolute vpon,
that the more odoriferous any wood is, the more durable also it is and euerlasting.

Next to these trees aboue rehearsed, the wood of the Mulberrie tree is most commended,
which in tract of time as it grows to be old, waxes also blacke. Moreouer, some kinds of wood
as they be more lasting than other, so they continue better being employed in one kind of work,
F than they do in another. The Elme timber will well abide the aire and the wind. The wild Oke
Robur louth to stand within the ground, and the common Oke is good in the water: let it be
vsed aboue ground to take the aire and the weather, it will cast, warpe, and cleaue too bad. The
Larch wood agreeth passing wel with water works, and so doth the black Alder. As for the Oke
Robur,

Thus it hath beene knowne that doore-hinges and hookes made of Oliue wood (which otherwise is most hard) if they haue rested any long time, and not beene worne by shutting, and opening too and fro, haue put forth fresh buds, as if they had growne still in the plant. As for the dore-barrs and bolts, *Cato* would haue them made of Holly, Bay-tree, and Elme. The handles and helues of rusticall tooles, mattocke steeles, and spade trees, *Hyginus* willethe they should be either of Hornebeame, Holme, or Cerrus. For fine painell in fret-woke, for feeling also and ouerlaying other wood, these are the chiefe, the Citron, Terebinth, Maple of all sorts, Box, Date tree, Huluer, Holme, Elder root, and the Poplar. The Alder tree likewise (as hath beene said) affordeth certain swelling bunches & hard knots, which may be cut and clouen into most daintie flakes and precious leaues, as faire and pleasant to the eie for their damask branch, as either Citron or Maple: setting which three aside, there be no knurs and nodosities in any treeworth ought and of account.

Moreover, yee shall haue trees ordinarily in the mids toward the heart, carie a more crisped and curled wood; and the neerer it is to the but or root end, the finer is the graine, more branching also, and the streaks winding in and out. Loe, from whence first came the superfluous expence to couer and seele one wood with another! See how those trees which for their very wood were of no price, are become more costly and dearer, when they serue as a barke to clau others! that one tree forsooth by this means, should be so sold many & sundry times at a feuerall price. Thus haue beene deuised (I would not els) thin leaues of wood, like gold or siluer-foile. And yet that is not all: for there is come vp of late a deuise, to paint and die in sundrie colors the hornes of beasts, to cut and saw their teeth into thin plates: and whereas at first there was fret-works only inlaid and set out with Iuorie here and there, soone after it came to passe, that the wood was couered all ouer therewith. Neither hath the ryot and wastfull prodigality of the world staid there, but proceeded farther, euen to searcho into the deepe sea for that, which might serue in stead of wood and timber. Thus the tortoise shel hath been cut into flakes and leaues, for want forsooth of wood vpon drie land. And now of late daies, certaine monstrous spirits, during the Empire of *Nero*, haue found out a deuise to disfigure the Tortoise shel also with paintings, that it might be sold the dearer when it lookt like wood. Thus means are wrought, that the price of beds should be raised and set vp by this meanes: thus they would haue the Terebinth wood to be excessive deare and aboue the worth: thus must the Citron wood be enhaunfed to an higher rate: and thus the Maple is counterfeited, Tortoise shells are foisted in the place and bought for it. To conclude, of late daies the curiositie of men was such, that they could not content themselves with rich and costly wood; and now for to beautify and set out ther wood, Tortoise shells must needs be bought, there is no remedie.

CHAP. XLIII.

¶ The age of trees: what kind of trees they be that are of least continuance. Semblably, of Missello, and the Priests called Druids.

If a man would consider the hidden corners of the world, and the inaccessible desarts that be in it, he might by infallible arguments conclude and resolute, that there be some trees that haue continued time out of mind, and liued infinitely. But to speak of their age only that are known (euen by the testimonie of ancient records, and those faithfully deliuered vnto vs) there are to be seen standing or growing at this day, about Linternum (a towne in Campaine) certain Oliue trees, that *Scipio Africanus* (the first of that name) planted long since with his owne hand. In the same place also there is a Myrtle tree, of a rare and admirable greatnesse; and vnder it, a caue or hole in the ground, wherein (by report) there lyeth a dragon that keepes the ghost and soule of the said *Scipio*. And at Rome, in the court-yard belonging to the chappell of goddesse *Diana Lucina*, there is yet to be seen a Lote tree standing before the said chappell, built in the yeare of the Anarchie, what time as Rome stood desolate of all magistrates, and that was 369 yeares after the foundation of the citie: but how much more auient this tree is than the said temple, God knoweth: for elder it is without all question, considering that of the groue or tuft of trees there growing, which the Latines call *Lucus*, the said goddesse *Diana* tooke her name * *Lucina*. Now it is 450 yeares or thereabout, since that time, and so old it is doubtlesse. Another Lote tree there is and elder than that, but the age thereof is likewise vncertain: known it is by

* *Gratia Lucina* dedis hoc tibi nomina *Lucus*. Ouid.

A by the name *Capillata*, [i. hairie:] so called, because the haire of the vestall Nuns heads is vsually thither brought, & there consecrated, and yet is there a third *Lotus* at Rome in the court-yard and cloister about the temple of *Vulcan*, which *Romulus* built for a perpetuall monument and memoriall of a victorie, and defraied the charges out of the tenths of the pillage and spoile that he woone from his enimies; and this tree is at least full as old as the citie of Rome, if it bee true that *Massurius* writeth. The roots thereof, passing along the street where the Burg-woifes vse to keep their residence, doe reach as farre as the statly market-place or Hall of *Casar*. There grew by it a Cypresse tree also of the same age, the which by an ouersight and careless neglect, fell downe no longer since then the last yeare of *Nero* the Emperour. But why stand wee long hereupon? there is an Holme growing in the Vatican, elder than Rome it selfe, with a plate of brasse vpon it engrauen in Tuscan letters, containing an inscription or title: whereby it appeareth, that euen in those daies the said tree for antiquity, was worthy of peoples deuotion. Moreover, it is well knowne, that the Tyburtines are more antient than the Romans, and their citie Tybur founded many a yeare before Rome: and yet certain it is, that there be yet three Holmes there remaining alie, elder than Tyburus himselfe, their first founder: vpon which trees (as the voice goeth) he obserued the flight of birds, and thereby tooke his auspices and warrant from the gods to build the said citie. And (by report) the sonne he was of *Amphiarauus*, who died at Thebes an hundred yeares before the Troiane warre. Writers there be who affirme, that both that Plane tree which groweth before the temple of *Apollo* at Delphos, was set by king *Agamemnon* owne hand: also another in the second groue of Caphys in Arcadie. Furthermore, C at this day, there be trees neere vnto the streight of Callipolis, sometime called *Hellespontus*, ouer-against the citie of the Ilians, where old Troy stood, growing close vnto the tombe or sepulchre of *Proetislaus*: which euery fourteene yeres so soon as they are shot vp so tall only as they may seeme to discouer and see the citie Ilium, immediatly begin to wither and fade, and afterwards spring againe and grow anew vnto that age and height aforesaid. Hard by the citie of Ilium, there be certain Okes also (as folke say) neer vnto the tomb of *Ilius*, which were then planted or set of acornes, when Troy began to be called Ilium. It is reported moreover, that the Oliue tree remains yet alie at Argos, vnto which *Argus* tied lady *Io*, after she was transformed or turned into an Heifer. About *Heraclea* in Pontus, there be certaine altars erected to the honor of *Iupiter* surnamed *Stratius*, ouer which there stand two Okes, both set by the hands of *Hercules*. In the very same tract there is an haue, ennobled and renowned by the name of *Amycus* the K. of the Bebrycians there slaine. His tombe, from the very day of his sepulture, hath been ouershadowed with a Bay tree (planted there and then for that purpose) which the people of that country do call The raging or mad Lawrell; for pluck but a branch or twig thereof be it neuer so small, and carie it into a ship; all the marriners and passengers within, will fall a brawling, and neuer agree vntill it be cast out and throwne away out of the vessell, that was brought thither from the tree aforesaid. Of a certain region we haue before written, called *Auloerene*, lying in the way between *Apamia* and *Phrygia*; & there the paissants of that country can shew you that very Plane tree, on which *Marsyas* the musitian hung himselfe in a melancholly mood for that he was ouermatched in his owne cunning and professed skill, by *Apollo*: and surely like it is, that euen then he made choise of that tree for the bignes: ouer and besides, in the Isle *Delos*, there is a Date tree to be seen, which hath remained there euer since that the said god *Apollo* was borne and reared there. The wild Oliue tree at *Olympia* (wherof *Hercules* wore the first coronet or guirland) is kept and tended still with great deuotion. The very same Oliue tree also (by folks saying) continueth this day at Athens, which sprung vp at the very time that *Minerva* and *Neptune* strove together about giuing the name to the citie Athens. And thus much of long-liued trees.

Contrariwise, Pomgranat trees, Fig trees, and Apple trees, liue a very short time: & of these, the hastie kind or Ienitings, continue nothing so large as those that bear and ripen later: neither yet those that carie sweet fruit, last so well as they that bring forth fower. The Pomgranat tree also with the more pleasant fruit, is shorter liued than the other. The like is to be said of Vines, and namely, such as bear greater burden of grapes & vield most wine. Howbeit *Gracinus* saith, That there haue been vine trees known to liue three score yeres. It seems also, that trees which come vp in waterish and moi st places, are not of any long continuance, but soone die. In deed Bay trees, Apple trees, and Pomgranat trees, do age & looke old quickly; howbeit they spring fresh,

fresh again from the root. Well then, the Oliue trees hold out life and liue very long: for after the common opinion and agreement of all writers, they continue ordinarily 200 yeares. There is a little hil named *Carnè* within the territory of *Tusculum*, not far from *Rome* city side, clad and beautified with a goodly groue and tuft of Beech trees, so euen and round in the head, as if they were curiously kept, cut, and shorne artificially with garden sheares: which groue was consecrated in old time to *Diana*, by the common consent of all *Latium*, which did their deuotions there. In it there was one especiall faire tree about the rest, which *Pasienus Crispus*, a man in our daies of great authoritie (as hauing been twice *Consull* in his time, & reputed an excellent *O-rator*, who also afterward mounted to higher place of reputation by marrying *Agrippina* the *Empresse*, by which match he became father in law to *Nero* the *Emperor*) cast a fancie and extraordinary liking vnto: in so much as he was wont not only to take his repose and lie vnder it, to sprinkle and cast wine plentifully vpon it, but also to clip, embrace, and kisse it otherwhiles. Neere adioining as a neighbour to the said groue, there is an *Holme*, which of it selfe alone is much renowned: it beareth in compasse about the butt therof 35 foot, and sends out ten monstrous big armes from the bodie, which may goe well enough for as many trees, and those euery one so great as it is wonderfull. Surely this one tree alone (a man would say) resembled a whole wood.

Moreover, there is nothing more certaine than this, that *Iuie* killeth trees. The like is to be said (in some sort) of the *Misselto*, although it is generally thought, that the harme thereby is not so soon seen. And this you must thinke, that this *Misselto* is not to be taken for the fruit of a tree, and therefore as great a wonder it is in nature, as any other: for some things there be, that not willing to grow out of the earth, engender in trees; & hauing no proper place of their own habitation to seat themselves in, sojourn as it were & make their abode with others, and of this nature is the *Misselto*. Also, in *Syria* there is a certain hearbe named * *Cadyas*; which windeth about, not trees onely, but also very bushes and thornes: likewise, all about the pleasant vale *Tempe* in *Thessalie*, you shall haue a kind of *Ferne* called *Polypodie*, to doe the same: also, the *Pulse* named *Dolychos*, which is *Fasels* or *Kidney* beanes, and the wild running-laced *Thyme*, *Serpillum*. Semblably, that which the *Greeks* call *Phaunos*: the very same, that after a man hath cut and pruned the wild *Oliue*, engendreth thereupon. The like is to be said of *Hippopheston* which groweth vpon the *Fullers* thorne or *thistle*: it beareth certaine little heads and hollow knobs with nothing in them, small leaues, and a white root; the juice wherof is singular good to euacuate and purge the bodie, for the diuersion of ill humors, in the falling sicknesse. But to returne againe to *Misselto*, there be three kinds thereof. For that which groweth on the *Firre* and *Larch* tree, is called *Stelis* in *Eubœa*, and *Hyphear* in *Arcadia*. And as for that which properly is *Misselto* indeed, most men are of opinion, that it groweth fast to the common *Oke*, the wild *Robur*, the *Holme*, wild *Plumtree*, and the *Terebinth*, and not lightly on any other trees. Howbeit, in greatest plenty it is seen vpon the *Oke*, and that is named *Dryos Hyphear*. A difference there is in the *Hyphear* and *Misselto*, on what tree soeuer they are found (except the *Holm* and common *Oke*) in regard of the sauer, which is strong and stinking in the one more than the other. The leafe of them both hath no pleasant smel, and in the *Misselto* it is bitter, clammy, and viscous besides. Of the two, *Hyphear* yet is the better to feed sheep and such cattell fat: only at the first it purgeth yll humors, and makes them to scoure apace, but afterwards it fattereth them; I mean such as were able to bear the said purgation. But in case any of them were deeply tacked and infected with the rot, or other inward consuming disease, they can neuer endure the taking of the said *Hyphear*, but they die vpon it. The only fit time for this kind of curing them, by the way of purging, is in *Summer*, and that for 40 daies space together. There is moreover, by mens saying, another difference in *Misselto*: for that which groweth vpon trees, shedding their leaues in winter, loseth also his owne leaues; but contrariwise, it continueth alwaies green vpon such trees as hold their leaues all the yeare long. Moreover, set or sow this *Misselto* what way soeuer you will, it will neuer take and grow: it comes onely by the mewting of birds, especially of the *Stockedone* or *Quoist*, and the *Blackbird*, which feed thereupon, and let it passe thorough their body. And this is the nature of it, vnlesse it bee mortified, altered and digested in the stomacke and belly of birds, it will neuer grow. It exceedeth not at any time a cubit in heighth, notwithstanding it be alwaies greene and full of branches. The male beareth a certaine graine or berry: the female is barren and fruitlesse. But sometimes neither the one nor the other beareth at all.

Now

*Some take
this for *Cassia*-
tha, or *Cuscuta*
Dodder.

- A Now as touching Birdlime, it is made of the berries of *Misseltoe*, gathered in haruest time before they are ripe; for if they should tarry still to take showres of rain, wel might they thrice and increase in bignesse, but their strength and vertue would be gon clean, for euer making any such glew or birdlime aforesaid. Being so gathered, as is before said, they must be laid abroad a drying, and when they be once dry, they are braied or flamped, and so put in water to sleepe, and let to putrifie for the space of 12 daies or thereabout. This one thing yet in the whole world is the better for putrefaction, and serueth to good purpose. When this is done, the said berries thus putrified and corrupt, are beaten or pummed once again with mallets, in running water; by which means when they are husked and turned out of their skins, the fleshy substance within, becommeth glutinous, and will stick too, in manner of glew. This is the way to make birdlime.
- B for to catch poore birds by their wings, entangled therewith; which toulers vie to temper and incorporate with the oile of *Walnuts*, when they list to set limetwigs to take fowle.

And so far as we are entred into a discourse as touching *Misselto*, I cannot ouerpasse one strange thing thereof vsed in *France*: The *Diuidæ* (for so they call their *Diuijors*, *Wise-men*, & the state of their *Clergy*) esteeme nothing more sacred in the world than *Misselto*, and the tree wherupon it breeds, so it be on *Oke*. Now this you must take by the way, These priests or *Clergy* men chofe of purpose such groues for their diuine seruice, as stood only vpon *Okes*; nay, they solemnise no sacrifice, nor perform any sacred ceremonies without branches & leaues thereof, so as they may seem well enough to be named thereupon *Dryidæ* in *Greek*, which signifieth as much as the *Oke* priests. Certes, to say a truth, whatsoeuer they find growing vpon that tree ouer and besides the own fruit, be it *Misselto* or any thing else, they esteeme it as a gift sent from heauen, and a sure signe by which that very god whom they serue giueth them to vnderstand, that he hath chofen that peculiar tree. And no maruel, for in very deed *Misselto* is passing geason and hard to be found vpon the *Oke*; but when they meet with it, they gather it very deuoutly and with many ceremonies: for first and formost, they obserue principally, that the *Moon* be iust six daies old (for vpon that day they begin their months and new yeares, yea and their secular ages, which haue their revolutions euery thirty yerres) because she is thought then to be of great power and force sufficient, and is not yet come to her halfe light and the end of her first quarter. They call it in their language *All-Heale*, (for they haue an opinion of it, that it cureth all maladies whatsoeuer) and when they are about to gather it, after they haue well

D & duly prepared their sacrifices and festiual cheare vnder the said tree, they bring thither two yong bullocks milk white, such as neuer drew in yoke at plough or wain, and whose heads were then and not before bound by the horn: which done, the priest araied in a surplesse or white vesture, climbeth vp into the tree, and with a golden hooke or bill cutteth it off, and they beneath receiue it in a white soldiers cassock or coat of armes: then fall they to kil the beasts aforesaid for sacrifice, mumbling many oraifons & praying deuoutly: that it would please God to blesse this gift of his to the good and benefit of all those to whom he had vouchsafed to giue it. Now this perswasion they haue of *Misselto* thus gathered, That whatliuing creatures soeuer (otherwise barren) do drink of it, will presently become fruitfull thereupon: also, that it is a soueraign countrepoison or singular remedie against all vermine. So vain and superstitious are many nations in the world, and oftentimes in such frivolous and foolish things as these.

THE

THE SEVENTEENTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIUS

SECVNDVS.

CHAP. I.

¶ The wonderfull prices of some Trees.

AS touching the nature of all those trees which of their owne accord doe grow, as well vpon the main land as the sea coast, we haue already treated sufficiently. It remaineth now to discourse of those which (to speake more properly) are made rather and forced by art and wit of man, than otherwise come by nature and of themselves. But before I enter into this treatise, I cannot chuse but maruel how it is come to passe, That those trees which for necessity & need we hauing taken from the wilde and brute beasts, and possessed in common with them (considering that men maintaine fight and scramble with them for the fruits that fall, yea and otherwhiles with the fowles of the aire, about those which hang vpon the tree) should grow to so excessive a price, as to be esteemed among the principall delights of this world? And that this is so, appeareth by that most notable example (in mine opinion) of *L. Crassus* and *Cn. Domitius Anobarus*. This *L. Crassus* (a right renowned Orator of Rome as any one of his time) had a stately and sumptuous dwelling vpon mount Palatine: howbeit that house of *Q. Caelius* (who defeated in battell the Cimbrians, together with *C. Marius*) went beyond it a faire deale in magnificence, and stood likewise within the pourprise of the same mount. But the goodliest and fairest Pallace knowne in that age, was that of *C. Aquilius* a Gentleman or Knight of Rome, scituate vpon the hill of Osiers, called Viminalis: in regard whereof there went a greater name of him, than for all the skill he had in the Ciuill Law, which was his profession. Yet of all those three, *Crassus* onely was challenged and reproched for that foresaid house of his. And in this manner is the storie deliuered: *Crassus* and *Domitius* (great personages both, and descended from most noble Houses in Rome) after they had bene Consuls, happened also to be chosen Censors together: and this fell out to be in the six hundred sixty two year after the foundation of the city: but during this Magistracie of theirs there passed many a foule day and bitter fit betweene them; so dissonant were their natures, and their conditions so farre vnlike. Now it fortuned vpon a time, that *Cn. Domitius* (as hee was hot and hasty man by nature, and carried an inward hatred besides in his heart, which soone is kindled and set on fire, yea and most insatiable, vpon emulation and enuy betweene Concurrents, such as they two were) reprooued *Crassus* verie sharply for his excesse in expence, and namely, That any Censor of Rome should dwell in so stately and sumptuous a Pallace as he did; and euer and anon made offer to buy the House, and pay him downe-right for it an * hundred Millions of Sesterces: whereat *Crassus* (being a man quicke of spirit, and of a prompt and present wit, finely conceited withall, and not to seeke for a ready answer) tooke him at his word, and accepted of the offer; refering only six trees that grew about his house. Tush (quoth *Domitius*, replying againe) take those Trees a way, and take all; if they be gone, I will none of the house though I might haue it for a single denier. Then *Crassus* hauing gotten the vantage and start of him, rejoyned and came vpon him thus: Tell me now I pray you good *Domitius*, whether of vs twaine giueth a scandalous example to the world? Whether am I my selfe (I say) offensive, and deserue to be taxed and noted by mine own Censorship, who can be contented to liue quietly and louingly among my neighbours in mine owne house, and that house which came to me by way of inheritance from my father;

* *Militer Sestertium*. An incredible price for a dwelling house: and therefore as *Madams* thinke, this place must be corrected, by conference with *Val. Max.* who for *(militari)* hath *(sexaginta)* which amounts little more than to the 20 part of the other summe.

A father; or you rather, that for six trees bid 100 millions of Sesterces? Now, if a man be desirous to know, what these trees might be? truly they were no other but six *Lote* trees, very faire and beautifull indeed, but there was nothing in them commendable, save only their spreading and casting a goodly shade. And verily, *Cacina Largus*, a Nobleman and principal citizen of Rome, vsed many a time and often (I remember well) to throw me when I was a yong man, those trees about his house. And since our speech hath bin of such trees as liue very long, these I wrote well, continued for the space of 180 yeres after *Crassus* death, to the great fire that *Nero* caused to be made for to burne Rome; fresh and green they were with good keeping, and looked yong still, like to haue liued many a faire day more, had not that prince hastened the vntimely death euen of trees also [as well as of citizens.] Now lest any man should think, that all the sumptuositie of *Crassus* consisted only in those trees, and that the furniture otherwise of his house was but mean and simple, and could minister vnto *Domitius* no matter of such contesting and reproofe, disposed as he was to quarrel and find fault: know he thus much, That the said *Crassus* had before that time set vp in the open hall of that house, foure goodly pillars of Hymettian marble, which in the yere of his Edileship were brought abroad to rich and beautifie the Theatre, the Stage and Shew-place of the solempne plaies by him set out: for as yet there had not bin in publicke place at Rome any marble pillars seen: so how lately is come vp this excessive expence in rich & glorious building, so common in these daies. See (I say) how in those times, faire trees beautified pallaces more than any thing els; in so much, as *Domitius* for the want of six trees only, would not stand to the price that him selfe first made, no not to buy his very enemy out of house and home with it: but no maruel if trees were accounted of so highly, seeing that our ancestors in old time thought not foon to take otherwhiles their surnames from them. Thus that braue and valiant fouldier came to be named *Fronatius*, who (maugre the beards of *Anibal*) swum ouer the riuer *Vulturnus*, with a chaplet of green leaues (answerable to his name) set vpon his head, and performed many feats of arms and worthie exploits against him. Thus they of the noble *Licinian* family had for their addition *Stolons* (i. the vnprofitable water-shoots that putt forth from the root or tree it selfe, and neuer proue or come to any good.) And why so? For that one of the said house deuised the means to cleanse trees & vines of such superfluous twigs (the practise & feat of cutting which a way, is called *Pampinatio*) and therupon was one *Licinius* first surnamed *Stole*. Moreouer, our predecessors in ancient time made good statutes and ordinances for the maintenance of trees: and expressly provided it was by the laws of the 12 Tables at Rome, in these words, *That whosoever made wilfull waste, and cut downe any trees growing in another mans ground, should be peined in the court for a trespassse done; & forfeit for euery such tree, 25 pound of brasse money.* But what should we thinke of this? Did these law-makers throw ye, suppose or imagine that other wilde trees would euer haue growne to that high reckoning about named, and which now they are come vnto, who valued fruitfull trees at no greater price, and set the penalty for the trespassse, so low? But neuer maruell we any more hereat, considering to what a proportion Apple-trees, and such like are risen vnto. For there be many of them here about the city of Rome, in the villages neere adioining, which are set for a yearely rent of 2000 Sesterces; and one of them yeeldeth more profit and reuenue by the yere to the owner, than a pretty ferm in times past of good domaine, to the land-lord. Hereupon came the inuention of grafting trees: for this purpose haue we such bastard fruits intermingled one with another, of sundry kindes; as if Apples and other fruits were not for poore men to eat, but grew only for the rich. Hence forward now therefore will we shew the right, perfect, and absolute manner how to order and cherish them, that it may appeare by what means especially, such annuall commodity can be made of them, as is before said. For the better performance of which discourse, I meane to leaue the common and ordinary way; neither will I handle the vsuall and vulgar manner of that point in husbandry, wherein euery man is perfect, and whereof no man maketh question: but deliuer such matters onely, as be vncertaine and doubtful, whereby oftentimes folke are deceived and beguiled. For to break my head or busie my brains in needlesse trifles, and therein to affect a kinde of curiositie, was neuer my manner yet, nor is it any part of my meaning and intention now. But before I doe enter into particulars, my purpose is to treat in generalitie of this matter, and touch briefly the consideration of heauen and earth both, so farre forth as may concerne in common all kindes of trees whosoever.

CHAP.

CHAP. II.

¶ Of the nature of the Skie respectiue vnto trees: and what quarter thereof they should regard.

Trees generally do like best that stand to the Northeast wind: for it nourisheth them well, causeth them to spread thick and grow euery way in length and breadth, and withall maketh the timber more fast and strong. But in this rule most men doe erre, and be much deceived; for in vnderpropping vines, the forks would not be set opposite against that wind to hinder the blast thereof; a point that is to be obserued in regard of the North wind only. Moreouer we find by experience, that if trees haue a kindly winter and cold season in their due time, their wood will be more firme, and so likewise will they bud and shoot out best: otherwise, if the warm Southerne winds blow vpon them much, ye shall haue the trees proue soft and feeble, and their blossoms come to nothing, blooming as they do before time: for if it chance that presently after their floures be fully out, and ready to shed, there fall any flore of raine, the fruit is quite gone for that yeare. And as for Almond trees and Peare-trees, if it be but close and cloudy weather only, without any raine, or the wind stand South when they floure, sure they be to lose their fruit. Certes, a glut of rain in May, at what time as the Brood-hen star called Virgilie doth arise, is exceeding hurtfull to Vines and Oliue-trees: for then is the very season of their knitting or conception. Then be the foure decretorie or criticall daies, that giue the doome of Oliue trees, either to good or bad: this is the Southerly point of filthy, foule, and glowmie weather, whereof wee haue spoken before. Moreouer, all manner of graine feelth the inconuenience of Southern wind at the time of their ripening. Well may come make hast and ripen sooner, but it shal neuer haue the kind maturity and perfection as it ought. As for the cold pinching black frosts and Northern winds, which blow out of season, come they early or come they late, they be hurtfull all. But if the wind stand Northeast in winter, there is nothing so good generally for all fruits of the earth. And verily, a good shower now & then during that time, wil do no harm; and that men wish for rain then, the reason is euident: for why? trees with bearing of fruit, are drawne dry and haue lost their naturall moisture, with shedding their leaues they be poore and feeble; so that it is kind for them to be hungry then, and to haue a greedy appetite to new food, which is raine. Now if the winter be open and warm withal, that so soone as the trees haue don bearing, they rest not between, but conceiue again presently vpon it (that is to say, bud & spurt anew, yea, and fall afresh to blossome, whereby they haue another euacuation that way also, to spend their sap and radicall moisture) we find by experience, that there is nothing in the world so bad for them. Nay, if many such yerres come together, immediately one after another, the very trees themselves will die; for who can looke for better, when they are thus pined and famished? He then whoseuer he was that said, Husbandmen were to wish for faire winters: surely he was no friend therein to trees, nor neuer praised for them: neither are wet Mid-summer good for Vines. But in truth, That winter dust should cause plentiful haruest, was a word spoken in a bravery, and proceeding from a pregnant wit and jolly spirit: for otherwise, who knoweth not, that euery man (wishing well to trees and corn indifferently) praieth, that snow might lie long vpon the ground? The reason is, for that not only it keepeth in & enloseth the vitall breath & soule (if I may so say) of the earth, ready to exhale out and vanish away, yea, and driueth it back again into the blade and root of corn, redoubling thereby the force and vigor thereof: but also because it both yeldeth moisture and liquor thereunto gently by little and little, and the same withall fine, pure, and passing light: considering, that snow is nothing els but the fume or froth of rain-water from heauen. This humor therefore, not falling forcibly all at once to drown the root, ne yet washing away the earth from it (but distilling drop-meale a little at once, in that proportion and measure as thirst requireth and calleth for it) nourisheth all things, as from a teat or pap; nourisheth (I say) and neither drencheth nor ouerfloweth them. The earth also for her part, by this means wel foked, swelleth and houth as it were with a leauen, and lieth thereby more light and mellow: thus being full of iuice and moisture it selfe, & not barren, but well replenisht with seeds sown, and plants suckled, thus continually in her womb; when the open time of the spring is once come to discharge her, she sheweth her selfe fresh and gay, and willingly entertaineth the warme weather of that season.

K

L

M

By

A By this meanes especially, we see how come liketh well vpon the ground, and thrueth apace euery where, vnlesse it be in climates where the aire is alwaies hot, as in Egypt. For continuance and ordinarie custome alone effecteth the same there, which the season of the time, & moderate temperature of the aire elswere. And in one word, be the place whatsoeuer, passing good it is to keep away the thing that is hurtfull. For in the most parts of the world it happeneth, That when either corn is winter-proud, or other plants put forth and bud too carely, by reason of the mild and warme aire; if there follow any cold weather vpon it, all is nipped, blasted, and burnt away. Which is the cause, that late winters do harme vnto the wild trees also in the forest. The more paine and sorrow likewise such trees abide, by reason of their owne thicke branches shading one another, and not easily admitting the warme Sun; and destitute they are besides of mans helping hand to cure them: for growing as they do in wild and desart Forrests, impossible it is to lap and wrap them about with wreaths and thumb-ropes of straw, and so to cherish and defend them when they be yong and tender. Wel then, to conclude this matter, Winter raine principally is seasonable and good for all plants: and next to it the dewes and showers that fall immediately before their sprouting time: a third sort also there be of showers that come when fruits hang on the tree, and are in their growth, yet not too soon, namely, before they bee strong and able to abide some hardnesse.

As touching trees which be late-ward and keep their fruit long ere they ripen, such also as require store of nourishment and more food still, as namely, the Vine, the Oliue, & Pomgranat trees; it is good for them to be watered with raine in the later end of the yeare. And to say a truth, euery kind of tree requireth a seuerall rain by it selfe, in due season, for that some ripen their fruit at one time, and some at another: so as a man shall see ordinarily the selfsame showers, to hurt one sort, and to help another; yea, and that diuers effect is to be seen in trees & fruits of the same kind, as for example, in Pyrries: for the late-ward of them call for raine at one time, and the hasty or forward at another, and yet indifferently all doe require alike the seasonable showers of winter, as also those before budding time. In which regard, the winds Northeast are better than the Southern, and such winters be most kindly. Semblably, by the same reason the Mediterranean or mid-land parts of any country are for this purpose preferred before the maritime or sea-coasts (as being for most part colder) the high & hilly regions before the plaines and vallies: and last of all, the night rains are held to be more profitable than those that fall by day time: for lands new sowne, and any yong plants, inioy more benefit by such shoures in the night, for that the Sun commeth not so presently vpon them againe to dry and drink vp all the moisture.

Hereunto ought to be annexed the consideration of Vine-yards, hort-yards, and Groues, as touching their situation, and namely, what part of the heauen they should regard. Virgil condemned altogether the planting of any trees, respectiue to the West: some haue chosen that quarter before the East. And this haue I obserued, that in most mens opinion, the South is best. But if I should speak what is mine own conceit indeed, there can no generall and infallible rule be giuen concerning this point, for to hold alwaies. All our skil and art herein must be directed by the nature of the soile, the disposition of the climat and temperature of the aire. In Africke although it be nothing profitable for Vine-yards to be planted so as they look into the South, yet kind it is & whole some for the Vine-planter and husbandman, by reason that all Africke lieth vnder the Meridionall or South climat. And therefore he that shall set vines there, either into the West or North (how soeuer Virgil alloweth not of the West) shall make an excellent, medley between the temperature of that aire and the nature of soile together. As for the North no man seemeth to make any doubt or question, but that vines so planted, wil proue right well. And verily there are not found any vines to prosper better, or to beare more fruit in all Italy than in that tract which lieth on this side, and vnder the Alpes: and there for the most part the Vineyards are so planted.

Moreouer in this case the winds would be much considered; for in Languedoc or the prouince of Narbone, in Liguria and part of Tuscan, they are reputed vnskillfull husbandmen that plant any vine-yards directly vpon the Northwest wind: but it is counted contrariwise a special point of prouidence and good husbandry, to cast it so, as the said wind may flanke it on the side. For this is the wind, which in those quarters qualifies and tempereth the excessive heat of the summer: howbeit, many times, so violent and blustering he is, that hee beareth downe before him the

the rooffe of many a house, and carrieth it cleane away.

CHAP. III.

¶ *The societie of the skie and aire with the earth, respecting to trees.*

SOME men do force the skie for to be obedient & conformable to the earth: as namely, when planting in dry grounds, they haue regard to the East and North: and contrariwise, when in moist places they respect the South. Moreover, it falleth out, that they be driuen otherwhiles to follow the nature of the very Vines, and thereby to be ruled: wherupon, in cold ground they plant such as be of the hastic kind, and soone ripen their grapes; to the end that they may come to their maturity and perfection, before cold weather comes. As for such Vines and trees bearing fruit, as cannot abide dewes, those they set in to the East, that the Sun may soon dispatch and consume the said dew: but looke what trees do loue dewes, and like well therewith, those they will be sure to plant against the West, or at leastwise toward the North, to the end they may inioy the full benefit thereof. All others againe (grounding in manner vpon natural reason only) haue giuen counsell to set as well Vines as Trees, into the Northeast. And *Democritus* verily is of this mind, that such fruits will bee more pleasant and odoriferous.

CHAP. IIII.

¶ *The quality of sundrie regions.*

AS touching the proper seat of the Northeast wind, and of all other winds, we haue spoken already in the second booke: and our purpose is in the next following, to treat of the rising and falling of signes and notable stars, of other Astronomical points also concerning heauen. Now in the mean time for this present, it is sufficient, that in the former rule of the North wind, we seem to rest and resolute vpon the apparent and euident argument of the wholesome and healthfull climate of the heauen: forasmuch as we see, that euermore all such trees as stand into the South, soonest shed their leaues: the same reason also is to be giuen of those that grow vpon the sea coasts: and albeit in some places the winds blowing from thence, and the very aire of the sea be hurtfull, yet in most parts the same are good and profitable. Certaine plants and trees there are, which take pleasure to be remot from the sea, and ioy to haue the sight of it only a farre off: set them neerer to the vapors and exhalations ascending from thence, they will take harm and mislike therewith. The like is to be said of great riuers, lakes, and standing pooles. As for those which we haue spoken of, they either burn their fruit with such mists, or refresh and coole such as be hot with their shade, yea, & take ioy and prosper in the frost and cold. And therefore to conclude this point, the surest way is, to beleue & trust vpon experience: thus much for this present, concerning the heauen: our next discourse will be of the Earth and Soile, the consideration whereof is no lesse difficult to be handled than the other.

First and formost, all grounds are not alike good for trees and most kinds of corne. For neither the black mould (such as Campain standeth vpon much) as in all places best for Vines; or that which fumeth and sendeth vp small and thin mists: neither is the red veine of earth any better, how soeuer there be many that commend it. The white earth or chalkie marle, the clay also within the territory of Alba and Pompeij, for a vineyard, are generally preferred before all other countries (although they be exceeding fat, which in that case is otherwise vially reiect.) On the other side, the white sand about * *Ticinum*: likewise, the blacke mould or grit, in many places, as also the red sandy ground, although it be wel mingled & tempered with fat earth are all of them nothing to the purpose for increase & fruitfulness. And herein must men take heed, because oftentimes their judgement may faile when it goeth but by the cie: for wee must not streight waies conclude, that the ground is rich & battle, wheron we see goodly faire & tall trees to grow, vlesse it be for those trees only: for where shal we meet with any, higher than the Fir: & is there a tree again that possibly can liue where it doth? No more is rank grasse & plentiful forrage a true token alwaies of a good ground: for there is no better pasture nor grasing to be found than in Almaine; and yet dig but vp the Greene sould and the thinnest coat of turfe that may be, ye shal presently come to barren sand vnder it: ne yet is it by & by a moist ground, that hath vpon it deepe grasse and hearbes shooting vp in height: no more verily, than a fat and

* *i* Pauc.

A and rich soile is knowne by sticking to one fingers, as appeareth plainly in all sorts of clay. And verily, no earth doth fill vp the trenches euen againe, out of which it was cast, that thereby a man might find out whether the ground be sad, or hollow: and generally all sorts thereof will cause yron to rust that shal be put into it. Moreover, there is no weighing of earth in ballance, to know by that means which is lighter or heavier: for who could possibly euer set down the iust weight that earth should haue? Again, the ground that is cast vp into banks by the ouerflow of great riuers is not alwaies commendable: seeing that some plants there be that decay, if they be set in water. And say that some such bank were ground good enough, yet it continueth not so long, vlesse it be for Willowes and oillers onely. But if you would know a rich ground indeed, one of the best arguments and signes therof is this, when you see it to bring forth a thick & strong haulme or straw, such as usually groweth in that noble territorie Laborine within Campaine; which is of that bignesse, that the people of the country vse it for fewell in stead of wood. Now, this ground, so good as it is, where & whensoever we haue found it, is hard enough to be tilled, and requireth great labour and husbandry, putting the poore husbandman to more paines in manner with that goodnesse of it, than possibly he could haue with any defects and imperfections thereof. For euen the hot earth, called by the name of Carbunculus, which vseth to burn the come sown therupon, may be helped & remedied (as it is thought) by setting it with plants of poore & hungry vines. The rough grauell stone which naturally will crumble as grit, many writers there bee that allow and commend, for vines. As for *Virgi*, he findeth no fault with the ground that beareth fern and brake, for a Vineyard. The earth that is brackish, and standeth much vpon saltpetre, is thought to be more found for many plants than others; and in regard of vermine that vse to breed therein, much safer also. Neither do high banks and hills remaine vntilled and naked for want of good husbandry, if so be a man haue the cast of it, to care & breake them vp skilfully. As for the plaines, they are not all of them exposed to the Sun or subiect to the wind more than need requireth. And to speake of frosts, mists and fogs, there be Vines (as we haue said already) which are nourished and fed with them. And to conclude, hereby we may see, that in euery thing there is some one deep secret or other, wherein it behoueth each man to employ his spirit and set his mind for to search them thoroughly and find them out: what shall we say then to this, That oftentimes those things which haue bin approoued by long experience and many obseruations, become otherwise, and change their visuall manner? In Thessalie about Larissa, the whole region, by reason of a lake that was let out and drained drie, proued much colder: and the Oliues which there grew before, left bearing and died all, vpon it. In like sort, neere vnto *Enos*, the Vines were all scorched and burnt, by occasion, that the course of the riuier *Enbrus* was brought neere vnto them, an accident that beforetime neuer befell vnto them. Semblably, about the citie *Philippi*, the whole country being made drie by sluices and trenches artificiall; altered withall the whole disposition of the aire and weather, and changed the very habite of the heauen about their heads. But in the territory of *Syracusa*, the forraigne Coloners that thither came to inhabit and practise husbandry, by ridding the ground from all the stones, marred all the corn in the country, so mirie and durty it was by that meanes, vntill such time as they were driuen to lay the stones againe where they had them. In *Syria*, the husbandmen goe lightly ouer with their plough, & take no deep stich in making their furrowes, for feare of the stony rocke lying ebbe vnder the good ground, which in Summer season will burne all their graine and seed sowne there. Now, there be certain parts of the world, where a man shall see one and the same effect to proceed both of extreame heat, and also of exceffue cold. *Thracia* is exceeding cold, and thereby plentifull in corne. *Africke* and *Egypt* be as hot, and yet come not after it for fertilitie in that kind. In *Chalcia*, an Island belonging to the *Rhodiens*, there is one place about the rest so fruitful, that the Barly which was sowed in the due time & season of the yere, they mow once, and presently put it into the ground againe, which will be ready to be cut downe the second time, with other corne in haruest. In the *Venafrane* tract within the realme of *Naples*, the grauellie ground is thought meetest for Oliue trees, & therein they bear most plentifully: contrariwise, about *Bætica* in *Spaine*, the fattest soile is best for that purpose. The excellent grape that makes the good *Punicke* wine, ripeneth soon vpon the very rockes: but the *Cæcube* Vines stand soaked & drenched (as it were) in the marish low grounds of *Pomptinum*. See what a difference and diuersitie there is in causes, to make this variety in sundry plots of ground! *Cæsar* *Tepesens* being conuicted before the *Censors*, and there pleading his cause, affir-

me 3

med openly, that the plaines of Roſea were the very fat of Italy, and reſembled the kell or leafe of a fed and franked ſwine: wherein (quoth he) if a man left forks or props to day, they will bee ouergrowne and couered with graſſe by to morrow. But ſurely, this ground is good for nothing but paſture. Yet now withſtanding, Nature would haue vs ſtill to learne and grow ſkilfull euery day more than other, and for that intent ſhe hath laid open the defects and imperfections of the ground, euen there, whereas the commodities thereof be neither ſo certain, nor ſo well knowne. And therefore let vs in the firſt place ſpeake of thoſe faults for which the earth is blamed.

CHAP. V.

¶ Sundry ſorts of earth.

If a man would know which is a lean, hungry, & bitter ground, there is no better experiment and prooſe thereof, than by the blackiſh, miſliking, and vnkind herbs growing thereupon: like as, when they come vp ſcorched and burnt, they ſhew a cold ſoile: alſo, when they ſeem ill fauoured and vnpleaſant to the eye, the earth no doubt is foked and drowned in wet. As for red ſandy ground and clay, you need go no farther than to your owne eye ſight. And ſuch ſoiles as theſe be, is of all other, hardeſt to be wrought and tilled; they ſo clog and load both the harrow teeth and the plow ſhares, with huge and heauie clods. Howbeit, the ground that is thus churliſh to be eared and husbanded, is not alwaies bad and naught for increaſe. But it fareth cleane contrary with the pale and wan aſhie earth, as alſo with the white ſandy ſoile: for the barren ground is ſoon found by a thicke and callous cruſt that it hath, euen at the firſt dent of culter or ſtroke of mattocke.

Cato ſetteth down briefly, as his maner is, all the defects and faults of ground in theſe words: Take heed (quoth he) of a rotten ground, and ſee that you ſtir it neither with cart, nor touch it with beaſt. What ſhould we thinke was his meaning by this term of his, that he ſhould feare rotten ground ſo much, as to forbid in a manner to tread and goe thereupon? Let vs call to mind the rottenneſſe that is in wood: and thereby ſhall we find thoſe faults that he abhorreth and deteſteth ſo much in the earth. In good faith, by rotten earth hee vnderſtandeth dry, ſpungeous, and full of holes, rugged, hoary, caren, old, and hollow. So as in that one ſignificant word (*Carioſa*) hee ſaid more than could be expreſſed poſſibly by any multiplicity of language whatſoeuer: for if a man would rip vp to the quicke the imperfections that are in grounds, he ſhould find, that ſome pieces thereof be of it that may be termed truly old and ouerworne, not for any age (for who can ſay properly, that earth is ſubiect to old age) but by reaſon of their naturall defects: in regard whereof, a ground may be weake, feeble, barren, and no longer good for to bring forth any thing. The ſame Cato iudgeth, That ground to be principall which lieth at the foot of an hill, and nunneth forth in manner of a plaine, into the South, which is the very ſituation of all Italy: and by a blackiſh and wart earth, which he calleth (*Pulla*) he meaneth a gentle, tender, and mellow ſoile. And this we will determine to be the beſt ſimply both for worke or tillage, and alſo for gaine and increaſe: now let vs (if ye pleaſe) ſtand a little vpon this word *Tenera* [*i. Tender*] which he ſeteth in this ſence: you ſhall find a marvellous ſignification thereof: and that he implieth thereby, as much as your heart can wiſh to be in a ground. That is it, which is ſo temperat in fertility, that is it which to be wrought is ſo gentle, ſoft, pliable, and mellow; neither wet, nor yet dry and thirſty. Now doth this ground ſhine againe after the plough ſhare, reſembling that veine of earth, which Homer, the very fountaine and ſpring of all good wits, reported to haue bin engrauen by a * god, in the armour of (*Achilles*): adding moreover, that the ſaid earth looked black withall: wherein hee obſerued a wonderfull piece of workmanſhip, notwithstanding it was wrought in gold. This is that ground, I ſay, which beeing new broken and turned vp with the plough, the threwd and buſie birds ſeek after, and goe vnder the plough ſhare for it: this is it, that the very Rauens follow the plough man hard at heeles for, yea, and are readie for greedineſſe to pecke and job vnder his very feet. And here, in this place I cannot chuſe but relate the opinion that is currant among our roſtous and delicate gallants: which ſome other thing alſo making for our purpoſe, in the diſcourſe of this argument which wee haue in hand. Certes Cicero, a man reputed (as he was no leſſe indeed) for a ſecond light of all good learning and literature. Better are eſteemed (quoth hee) the ſweet compositions and ornaments which taſt of earth, than of ſaffron: where note by the way, that this great Clarke choſe to vſe the word

A of taſt rather than of ſmell, in ſuch odoriferous perfumes and mixtures. Well, to ſpeake at a word, ſurely that ground is beſt of all other, which hath an aromaticall ſmell and taſt with it. Now if we liſt moreover to be better inſtructed, what kind of ſauour and odour that ſhould be, which we would ſo gladly find in the earth; we may oftentimes meet with that ſcent, euen when ſhe is not ſtirred with the plough, but lieth ſtill and quiet, namely, a little before the ſun ſetting, eſpecially where a rainbow ſeemeth to ſettle & pitch her tips in the Horizon: alſo, when after ſome long and continuall droughe, it beginneth to rain; for then being wet and drenched therewith, the earth will ſend vp a vapor and exhalation (conceiued from the Sun) ſo heavenly and diuine, as no perfume (how pleaſant ſoeuer it be) is comparable vnto it. This ſmell there muſt be in it when you ere it vp with the plough: which if a man find once, he may be aſſured it is a right good ground; for this rule neuer faileth: ſo as (to ſay a truth) it is the very ſmel and nothing els, that will iudge beſt of the earth: and ſuch commonly are new broken grounds, where old woods were lately ſtocked vp: for all men by a generall conſent, do commend ſuch for excellent. Moreover, the ſame ground for bearing is held to be far better, whenſoeuer it hath reſted between, and either lien ley or fallow; whereas for vineyards it is cleane contrary: and therefore the more care and diligence is to be employed in chuſing ſuch ground, leaſt wee approoue and verifie their opinion, who ſay, That the ſoile of all Italie is already out of heart and weary with bearing fruit. This is certaine, that both there and elſewhere, the conſtitution of the aire and weather, both giueth and taketh away the opportunitie of good husbandrie, that a man cannot otherwiſe do what he would: for ſome kind of grounds there is ſo fat and ready to reſolue into mire and dirt, that it is impoſſible to plough them and make good worke, after a ſhower of rain. Contrariwiſe, in Byzacium a territory of Africke, it is far otherwiſe: for there is not a better and more fruitfull piece of ground lieth without dore than it is, yeelding ordinarily 150 fold; let the ſeaſon be dry, the ſtrongest teeme of oxen that is, cannot plough it: fall there once a good ground ſhower, one poore aſſe, with the help of a filly old woman drawing the plough ſhare at another ſide, will be able to go round away with it, as I my ſelfe haue ſeen many a time and often. And whereas ſome great husbands there be, that teach vs to enrich and mend one ground with another, to wit, by ſpreading fat earth vpon a lean and hungry ſoile; & likewiſe by caſting drie, light, and thirſtie mould, vpon that which is moiſt and ouer-fat, it is a meere follie and waſtfull expence both of time and trauaile: for what fruit can he euer looke to reape from ſuch a mingle mangle of ground?

CHAP. VI.

¶ Of the earth which Britaine and France loue ſo well.

The Britaines and Frenchmen haue deuifed another meanes to manure their ground, by a kind of lime ſtone or clay, which they call Marga [*i. Marle*]. And verily they haue a great opinion of the ſame, that it mightily enricheth it & maketh it more plentiful. This marle is a certaine fat of the ground, much like vnto the glandulous kernels growing in the bodies of beaſts, and it is thickened in manner of marrow or the kernell of fat about it.

CHAP. VII.

¶ The diſcourſe of theſe matters continued according to the Greekes.

The Greekes alſo haue not ouerpaſſed this in ſilence: for what is it that they haue not medled withall? The white clay or earth wherewith they vſe to marle their grounds in the territory of Megara, thoſe onely I mean which are moiſt and cold, they call Leucargillæ. Theſe marles (all the kind of them) do greatly enrich France and Britaine both, and therefore it would not be amiſſe to ſpeak of them more exactly. In old time there were two ſorts thereof, and no more: but of late daies (as mens wits are inuentiue euery day of one thing or other) they haue begun to find out more kindes, and to vſe the ſame: for there are now diuers marles, the white, the red, the Columbine, the clay ſoile, the ſtony, and the ſandy: and all theſe are but two in nature, to wit, either hard and churliſh, or elſe gentle and fat. The triall of both is knowne by the handling and a twofold vſe they yeeld; either to beare corne onely, or els for graſſe and paſture alſo. The ſtonie or grauelly ſoile is good only for to nourish corne; which if it be white

withall, and the pit thereof found among springs or fountains, it wil caufe the ground to be infinite fruitfull; but it is rough in handling, and if it be laid too thick vpon the lands or leyes, it wil burn the very ground. The next to it is the red marle, called also Capnumargos, which hath intermingled in it a certaine small stony grit full of sand: This stony marle the manner is to break and bruiſe vpon the very lands; and for the first yeares, hardly can the straw be mowne or cut downe for the said stones. Lighter is this marle than the rest by the one halfe, and therefore the cariage thereof into the field is least chargeable. It ought to be spread and laid thin, & some thinke that it standeth somewhat vpon salt. But both the one and the other will serue well for fifty yeares, and the ground enriched thereby, will (during that time) yeeld plenty as well of corne as grasse.

CHAP. VIII.

¶ Sundry sorts of Earth and Marle.

OF those marles which are found to be fat, the white is chiefe; and thereof be many sorts. The most mordant and sharpest of them all, is that whereof wee spake before. A second kind there is of chalkish clay, which our gold-smiths vse (called Tripela:) this lieth a great depth within the earth, inſomuch as many times men are driuen to sinke pits 100 foot deep, for it; and those haue a small and narrow mouth aboue, but within-forth and vnder the ground they be digged wider, by reason that the veine thereof runneth many waies, in manner of other mettall mines. This is the marle so much vsed in Britain: the strength thereof being cast vpon a land, will last 80 yeares; and neuer yet was the man known that herewith marled the same ground twice in all his life time. The third kind of white marle, is that which the Greekes call Glischromargon: it is no other than the Fullers chalkie clay mixed with a viscous and fatty earth. The nature of it, is to breed grasse better than to beare corne: for after one crop of corne is taken off the ground in haruest, before seed time is come for winter grain, the grasse wil be so high growne, that a man may cut it down and haue a plentiful after-math for hay; and yet all the while that it hath corn vpon it, you shall not see it to beare any grasse besides. This marle continueth good 30 yeares: if it be laid ouer-thick vpon a land, it choketh the ground in manner of * Cumine. The Columbine marle, the Gauls call in their language, by a name borrowed of the Greeks, Pelias, (i. Doue or Pigeon marle:) it is fetched out of the ground in clots and lumps, like as stones be hewed out of quarries: with Sunne and the frost together, it will resolue and cleaue into most thin slates or flakes. This marle is as good for corne as for herbage. As for sandy marle, it will serue the turn for want of other: yea and if the ground be cold, moist, and weely, the husbandman will make choice thereof before other.

The Vbians, vpon my knowledge, vse to enrich their ground and make it more battle (though their territory otherwise be most fertile) with any earth whatsoever; provided alwaies that it be digged vp three foot deep at least, and laid a foot thick; a deuise that no other country doth practise: howbeit this soile and manner of manuring, continueth good not aboue ten yeares: the Hedunans and Pictones, haue forced their grounds and made them most plentifull, with lime-stones, which is found also by experience to be passing profitable for vines and oliues.

To come now to the ordering of this piece of husbandry: the ground ought to be ploughed first, before marle of any sort be cast vpon it; to the end that the medicinable vertue & substance thereof, might the sooner and more greedily be receiued into it. Now forasmuch as marle is at the first ouer-rough and hard, not so free in the beginning as to resolue and turne into blade or grasse, it had need of some compost or dung to be mingled with it: for otherwise, be it neuer so rich, it will rather do harm than good to the ground, by reason that it is yet strange and not acquainted therewith: and yet help it this way as well as you can, it will not bring forth any plenty the first yere after it is laid on. Last of all, it skilleth much to consider the nature of the ground, which you mean to marle: for the dry marle, forteth well with a moist soile; and the fatty, hiteth that which is dry and lean. But when the ground is of a middle temperature between both, it mattereth not whether you vse the white gold-smiths chalker, or the Columbine-marle, for either of them will serue well enough.

CHAP.

CHAP. IX.

¶ The vse of ashes vpon lands: of Dung: what graine or pulse (swine, doth make the ground more plentifull, and what burneth it.

THE people dwelling beyond the Po, make such account of ashes for to enrich the grounds withall, that they prefer it before horse-muck, and such like: which dung (because they take it to be very light) they burne also into ashes for that purpose. Howbeit (as we haue said before) in one and the same corn-land, they vse not ashes and mucke both at once: no more doe they cast ashes in hortyards for to nourish yong trees, nor in fields, for some kind of corn. Some are of iudgement, that grapes are fed with dust: who also do cast dust vpon them when they begin to bloome, yea and bestrew dust vpon the roots as well of Vines as other trees. Certain it is, that in the prouince of Narbon they vse so to do, and they are assuredly persuaded, that grapes ripen better and the vintage cometh the sooner thereby: because in those parts dust doth more good than the Sun.

As for mucke, there be diuers sorts thereof, and in old time much vse there was of it: for in Homer we read, that long ago the good old king [Laertes] was found laying soile and dung vpon his land with his own hands. The first that deuised mucking of grounds, was (by report) Augur a king in Greece: but Hercules divulged the practise thereof among the Italians, who in regard of that inuention immortalized their K. Stercutius the son of Fauus, M. Varro esteemeth the dung of Blackbirds (gathered out of their bartons where they be kept in mew) aboue all others.

He highly magnifieth and extolleth it also, for that it bringeth forth so good forage to feed kine, oxen, and swine withall: auouching for certaine, that they will become fat beefe and pork with no meat sooner. We must thinke well therefore and hope the best of the world now adaies, since that our ancestors and forefathers so long ago had so great bartons and pens, that the dung of fowls there kept, was sufficient to help their hard and hungry grounds. In the second degree of goodnesse, Columella rangeth Pigeons dung gathered out of Doue-cotes: the third place hee giueth to that of Hens, and other land pullen, reiecting altogether the dung of water-fowle. Howbeit all other Authors (setting these two aside) attribute with one voice and consent vnto the excrements of mans body, the greatest praise for this purpose. Some of them prefer mans urine, and namely, when the haire of beast-hides haue bin foked therewith and quicke-lime together, in the Tanners pits. Others vse urine alone by it selfe, only they mingle water with it againe, but in greater quantitie a good deale, than they (whose urine it was) did put to the wine when they drinke it: and good reason too; for more need there is now to correct and repress the malice thereof, considering that besides the native malignitie of the wine it selfe, mans bodie hath giuen and imprinted into it, a strong and vsaurie quality. Thus you may see how men labour, strue, and try conclusions, to feed and enrich the very ground, the best way they can deuise. Next vnto the ordure and urine of mans body, the filthy dung of swine is most commended: only Columella condemneth it. Some praise the mucke of any foure-footed beasts whatsoever, so they were fed with Tree-trifolie, called Cytisus. Others prefer the dung of Pigeons before any other; in the second place that of Goats; thirdly of sheepe; then of kine and oxen; and lastly of cart-jades, mules, asses, and such like. Thus you see as well what difference there was in times past, between this dung and that; as also what were the rules (so farre as I can guesse and learne) whereby they went, in the vse and ordering thereof: for, to say a truth, the old way is best, cūen herein as well as in other matters. Ouer and besides, the practise hath bin already seen in some of our prouinces (where there is so great store of cattell bred) to riddle and sift their dung ouer their ground through sieues, in manner of meale; and so in proceſſe of time it loseth not only the stinking sent and ill-fauored sight that it had, but also turneth into a pleasant smell, and looketh louely withall. Of late, found it hath been by experience, that Oliue trees doe like and prosper very well, if the ashes of lime-kills especially be laid to their roots. Varro, among many other precepts, addeth and saith, That corne grounds would be manured with horse-dung, because it is the lightest; but meadows require compost that is heavier, and namely, made by beasts that haue barley for their prouender; for that such soile bringeth plenty of grasse. Some there bee also, that preferre the dung made by horses, before the mucke of kine and Oxen; likewise sheeps treddles, before Goats dung; but Asses mucke before all other, because

* Cymini.
Turnub. reades
Siginis, & mea
neth thereby
shards of pot-
ters worke and
such like rub-
bifh.

they eat and chew their meat most leifurely. But daily experience teacheth the contrary, and testifieth againft the one and the other. And thus much as touching compoft of mucke.

Furthermore, all men are of opinion, that nothing is better for the ground, than to fow Lupines therupon, prouided alwaies, that before it coo, it be turned into the ground by the plough, fpede, or two-piked yron forke; alfo when it is cut down, to make it into wads or bottles, and fo to bury them at the roots of trees, and vines efpecially. In countries where there are no cattell to better the lands, it is thought good to manure the fame in ftead of beafts dung, with very hawme, ftraw, and ferne. *Cato* hath a deuife to make an artificiall mucke or compoft of litter, lupine ftraw, chaffe, beane stalks, leaues and branches both of Malt-holm and oke. He faith moreover to the fame purpose: Weed out of the ftanding corn * Walwort [otherwife called Dane-wort] and Hemlock; alfo from about oſier-plots, plucke vp ranke weeds, or ground Elder; alfo Reeke or Sea-graffe, and dead leaues or branches lying rotten vnder trees: when thou haſte ſo done, ſtrew, and lay a courſe of them vnder ſheep where they be folded. *Item*, If the Vine begin to decay and wax leane, burne the fthreads and cuttings of the owne, and turne the aſhes vnder ground hard to the roots thereof. *Item*, where thou meaueſt to ſow any wheat or ſuch like bread-corn, draw thy ſheep thither, and there fold them. He faith moreover, that the ſowing of ſome graine is as good as a dunging to the ground: for theſe be his very words, The fruit it ſelfe of the earth is a batling to the earth; and namely, Lupines, Beans, and Vetches, for they muck the lands: like as on the contrary ſide, Chiches do burn the ground, both becauſe they are plucked, and alfo for that they ſtand vpon ſalt. Semblably doth Barley, Foenigreeke, Eruiſe, and generally all kind of pulſe which are pulled and not mowne downe. *Item*, Take heed (quoth *Cato*) that you ſet no pepins or kernels, where you meaue to ſow corne. As for *Virgil*, he is of opinion, that the ſowing of Line-feed for flax, likewiſe of Otes and Poppies, do burne corne-ground and pill it out of heart. He alſo giueth rules as touching mucke-hills, That they ſhould be made in the open aire, within ſome hollow place where it may gather water; that they be couered ouer with ſtraw and litter, for feare they ſhould dry in the Sun; and laſt of all, that they haue a good ſtrong ſtake of Oke pitched and driuen in about the mids thereof, for ſo there will no ſnakes nor ſuch like ſerpents breed and ingender therein. Moreover, as touching the ſpreading of mucke, and mingling it with the mould of a land, it is exceeding good to do it when the winde ſetteth full Weſt, ſo that the Moon then be paſt the full and in the Waine. But this rule many haue miſtaken and not conſidered aright, ſuppoſing that they ſhould ſo do when the Weſtern wind Fauonius beginneth to riſe, and namely in the moneth of Februarie only; whereas indeed moſt countries require this point of huſbandry in other moneths as wel. But looke what time ſoeuer you liſt to do it, be ſure in any hand that the wind do then blow from the Equinoſſiall point of the Weſt, and that the moone then be in the waine, and drie withall. Haue regard to theſe rules and obſervations, you will wonder to ſee the effects thereof, and what increaſe the earth thereby will yeeld.

CHAP. X.

¶ The planting and ſetting of trees: the manner how trees do grow, by a ſion ſlued and plucked from the root.

Now that we haue already ſufficiently treated of the conſiderations as well of the aire and ſkie, as of the earth, belonging vnto plants and trees; me thinks it were to good purpoſe to diſcourſe of the induſtry and artificiall meanes that men haue vſed to make trees grow: and verily we ſhall find no fewer kinds of them that come by mans hand, than of ſuch as nature it ſelfe hath brought forth; ſo kind and thankfull we haue bin to her, as to make recompence in this behalfe. Firſt and formoſt therefore this is to be noted, That all trees do grow either of ſeed ſowne, or of branches growing to the tree and couched in the ground, or of an old ſtocke from whence new imps may ſprout: alſo, either of a ſlip or ſprig plucked from another tree, and ſo laid in the ground; or of a young ſhoot, twig, impe, or ſion, engrafted in the very trunk of a tree, ſlit and clouen for that purpoſe. For I cannot chuſe but maruell much at *Trogus*, who was verily perſuaded, That about Babylon the leaues onely of Date trees beeing ſet or ſowne, would proue trees. Now whereas there be ſo many deuifes abouefaid for to nourish trees, this you muſt vnderſtand, that ſome trees there be which will grow by many of theſe waies before ſpecified,

A ſied, and others by them all. And verily the moſt part of this knowledge hath beene taught by Nature her ſelfe: for firſt of all, we haue learned by her for to ſow ſeed, by occaſion that we haue ſeen ſome to fall from trees, which being received by the ground, haue chitted, taken root, and liued. And in very truth, ſome trees there be that grow no otherwiſe, as Cheſtnut, and Walnut-trees, excepting onely thoſe that being cut downe, doe ſpring new again from the root. Of ſeed alſo (although the ſame be farre vnlike to others) thoſe alſo will grow; that are vſually plucked otherwiſe; as for example, Vines, Apple trees, and Pyrries: for in theſe the ſtone and pepin within, ſeructh in ſtead of the ſeed; and not the fruit it ſelfe, as in thoſe before rehearſed, the kernels whereof [i. the fruit] are ſowne. Medlars likewiſe may come vp of ſeed. But all the ſort of theſe that ſpring after this manner, be late ere they be come forward, and ſlow in growth: they turn alſo to a degenerat and baſtard nature, and had need to be graſſed anew ere they be reſtored to their owne kind: which is the caſe of Cheſtnuts alſo otherwhiles. Howbeit there be others for them againe, which (ſow or ſet them what way you will) neuer grow out of their owne kind; and ſuch be Cypreſſes, Date trees, and Lawrels: for the Lawrell commeth vp by ſowing, by ſetting, and planting, after ſundry ſorts. The diuers kinds whereof, we haue deſcribed already. Of all which, the Lawrell Auguſta with the broad leaues, the common Bay tree alſo that beareth berries, as alſo the wild kind named Tinus, be ordered all three after one and the ſame ſort. The manner whereof is this: the Bayes or berries thereof, be gathered dry in the moneth of Ianuary when the Northeaſt wind bloweth: they are laid abroad thin to wither, one apart from another, & not in heaps, for feare they ſhould catch a heat. This done, ſome put them afterwards in dung; and being thus prepared and ready for to be ſowne, they ſteep them in wine. Others take and lay them within a large basket or twiggen panier, trample them vnder their feet in a brook of running water, vntill they be pilled and rid of their outward ſkins: for otherwiſe their ſkin is of ſo tough and moiſt a ſubſtance, that it would hardly or not at all ſuffer them to come vp & grow. After all this, in a plot of ground wel and thoroughly digged once or twice ouer, a trench or furrow muſt be made a handfull deepe, and therein the berries ought to be buried by heaps, to wit, twenty or thereabout together in one place: and all this would be done in the month of March. Lawrels alſo will grow, if their branches or boughes be bended from the ſtocke and laid within the ground: but the Triumphall Lawrell will come vp no other way but by ſetting a graffe or impe cut from it. As for the Myrtle, all the ſorts thereof within Campaine, come of berries ſown: but we at Rome vſe to interre only the boughes of the Tarentine Myrtle, growing ſtill to the body, and by that means come to haue Myrtle trees. *Democritus* ſheweth another deuife alſo to increaſe Myrtles, namely, to take the faireſt and biggeſt berries thereof, & lightly to bruife or bray them in a mortar, ſo that the grains or kernels within be not broken; & then to beſmeare with the batter or ſtamped ſubſtance thereof, a courſe cord made of Spart or Spaniſh broome, or els hempen hurds, and ſo lay it along within the ground. Thus there wil ſpring therof, a maruellous thick hay or wall (as it were) of yong Myrtles: out of which, the ſmall twigs you may draw which way you will, yea, and plant them elſewhere. After the like manner, folke vſe to ſow thorns or brambles for to make hedges & mounds, namely, by anointing ſuch another hempen rope with bramble blacke-berries, and interring the ſame. As for Bayes thus ſowne, when they come once to beare a dark and blackiſh leaſe: Myrtles alſo, when their leaues be of a wine color, to wit, of a deep red (which commonly happeneth when they be three yerres old) it will be time to remoue and tranſplant.

Among thoſe plants and trees that are ſowne of ſeeds, *Nago* maketh much ado, and is ſouly troubled about thoſe trees that beare nuts, & ſuch like fruit in ſhells: for to begin with almonds firſt, he would haue them to be ſet in a ſoft clay ground that lieth into the South: & yet he faith again that Almond trees loue a hot and hard ſoile; for in a fat or moiſt ground, they will either die or els wax vnfruitful. But aboue all, he giueth a rule to chuſe Almonds for to ſet or ſow, that be moſt ſhoked, and eſpecially ſuch as were gathered from a young tree: alſo he ordaineth, that they ſhould be well ſoked or infuſed in ſoft beaſt ſterne or thin dung, for three daies together: or at leaſt wiſe in honied water, a day before they be put into the ground. *Item*, they ought (by his ſaying) to be ſet charily with the ſharp and pointed end pitched downward, and the edge of the one ſide to turne into the Northeaſt. Alſo that they muſt ſtand three and three together in a triangle, for ſooth, ſo as there be a handbreadth iuſt between euery one. Moreover, that euery tenth day they ought to be watered, till they be ſhot vp to a good bigneſſe. Now to come vnto

walnuts, they be laid along within the earth, with this regard, that they do ly vpon their joints. **G** As for pine nuts, there would be six or seuen of their kernels put together into pots that haue holes in them, and so buried in the ground: or else they should be ordered after the manner of the Bay tree, which commeth of berries bruised, as hath been shewed before.

The Citron tree will grow of seed, and may be set also of sprigges or twigs drawne to the ground from the tree, and so couched. Seruis trees come of the grains thereof sowed of a quick-set plant also with the root, or of a slip plucked from it. But as the Citron trees liue in hot grounds, so these Seruises loue cold and moist.

As concerning seminaries and nourse-gardens, Nature hath shewed vs the reason and maner thereof, by certaine trees that put forth at the root a thick spring of yong shoots or fions, but lightly the mother that beareth these imps, killeth them when the hath done, with her shade and dropping together. And this is euident to be seene in Lawrels, Pomegranate trees, Planes, **H** Cherry trees, and Plum trees: for standing as these imps doe, a number of them without all order vnder their mother stocke, they be ouershadowed and kept downe so, that they mislike and neuer come to prooffe. Howbeit some few there be of this sort, that are not so vnkinde to their yong breed, as to kill them with the shadow of their boughs, and namely Elmes & Date trees. This would be obserued by the way, that no trees haue such yong imps springing at their feet, but they only whose roots for loue of the warm sun and moist rain, spread aloft and ly euen within the ground. Moreover, the manner is not to set these yong plants presently in the place where they must remaine and continue for altogether, but first they are to be bestowed in a piece of ground where they may take nourishment, to wit, in some nourse-garden for the nones, vntill they are grown to a good stature, and then they are to be removed a second time to their due place. And a wonder it is to see, how this transplanting doth mitigate euen the saue nature of the wildest trees that are: whether it be that trees as well as men are desirous of nouelties, and loue to be traueilling for change; or that as they go from a place, they leaue behind them their malicious qualitie, and being vsed to the land, become tame and gentle like the wild beasts; especially when such yong plants are plucked and taken vp with the quicke root. Wee haue learned of Nature also another kinde of planting like to this: for we see that not only water shoots springing out of the root, but other sprigs slipped from the stocke, liue and doe full well: but in the practise of this feat they ought to be pulled away with a colts foot of their owne, so as they take a quicke parcell also of their mothers bodie with them, in manner of a fringe or border hanging thereto. After this manner they vse to set Pomegranate, Filbert, Hazell, Apple, **K** and Seruis trees; Medlars also, Ashes, and Figge trees; but Vines especially: marie, a quince ordered and planted in that sort, will degenerate and grow to a bastard kinde. From hence came the inuention, to set into the ground yong sprigs or twigs, cut off from the tree. This was at first practised with foot-sets for a prick-hedge, namely, by pitching down into the earth, Elder, Quince-cuttings, & brambles; but afterwards men began to do the like by those trees that are more set by, and nourished for other purposes, as namely Poplars, Alders, and the Willow, which of all others may be pricked into the ground with any end of the cutting or sprig downward, it makes no matter whether, for the smaller end will take as well as the bigger. Now al the sort of these are bestowed and ranged in order at the first hand, euen as a man would haue them and where he list to see them grow, neither need they any remouing or transplantation at all. But before we proceed any further, to other sorts of planting trees, it were good to declare the **L** manner how to order seminaries, seed-plots, or nourse-gardens.

For to make a good pepinier or nourse-garden, there would be chosen a principal and special peece of ground: for oftentimes it falleth out, yea and meet it is, that the nourse which giueth sucke should be more tender ouer the infant, than the owne naturall mother that bare it. In the first place therefore, let it be found and drie ground, howbeit furnished with a good and succulent elemental moisture, and the same broken vp and afterwel digged ouer and ouer with mattock and spade, and brought to temper and order, so as it be nothing coy but readie to receiue al manner of plants that shall come, and to entertain them as welcome guests; & withall, as like as may be to that ground vnto which they must be removed at last. But before al things this would be looked to, that it be rid clean of all stones, surely fenced also and paled about, for to keep out cockes and hens and all pullen: it must not be full of chinkes and cranies, for feare **M** that the heat of the sunne enter in and burne vp the small filaments or stringes and beard of the

new

A new roots: and last of all, these pepins or kernels ought to stand a foot and a halfe asunder: for in case they meet together and touch one another, besides other faults & inconueniences, they will be subiect to wormes: and therefore I say there would be some distance between, that the ground about them may be often harrowed and raked, to kill the vermin, and the weeds pluckt vp by the heeles that do breed them. Moreover, it would not be forgotten to proin these yong plants when they are but new come vp: to cut away, I say, the superfluous sprigs vnderneath, and vse them betimes to the hooke. *Cato* giueth counsel to sticke forks about their beds a mans height, and lay hurdles ouer them, so as the Sun may be let in vnderneath: and those hurdles to couer and thatch ouer with straw or holme, for to keepe out the cold in winter. Thus are yong plants of Peare trees and Apple trees nourished: thus Pine nut trees, thus Cypresses which do **B** likewise come vp of seed, are cherished.

As for the grains or seeds of the Cypres tree, they be exceeding small, and so small indeed, that some of them can scarce be discerned well by the eye. Wherein the admirable worke of Nature would be considered, to wit, that of so little seeds should grow so great and mightie trees, considering how far bigger are the cornes of Wheat and Barley (to make no reckoning nor speech of Beans) in comparison of them. What should we say to Peare trees and Apple trees? what proportion or likenesse is there between them, and the pretty little pepins whereof they take their beginning? Maruell we not, that of so slender and small things at the first, they should grow so hard, as to checke and turne againe the very edge of ax and hatchet: that frames and stocks of presses should be made thereof so strong and tough, as will not shrinke vnder the heauiest poise and weights that be: that Mast-poles comming thereof should be able to beare **C** faile in wind and weather: and finally, that they should afford those huge and mightie Rams and such like engins of batterie, sufficient to command towers and battils, yea, and beat downe strong walls of stone before them? Lo what the force of Nature is! see how powerfull shee is in her works! But it passeth and exceedeth all the rest, that the very gum and liquour distilling out of a tree, should bring forth new plants of the same kind, as we will more at large declare in time and place conuenient. To returne then againe to the female Cypres (for the male as hath bin said already bringeth forth no fruit) after that the little balls or pills (which be the fruit thereof) be gathered, they are laid in the Sun to dry, during those moneths, which we haue before shewed, and being thus dried, they will breake and cleaue in sunder. Now, when they are **D** thus opened, they yeeld forth a seed which Pismires are very greedy of. Where another wonder of Nature offereth it selfe vnto vs, That so small a creature as it should eat and consume the seed which giueth life and being to so great and tall trees as the Cypres. Well, when the said seed is gotten, and the plot of ground laid euen and smooth, with cylinders or rollers, it must be sowne of a good thicknesse in the moneth of Aprill: and fresh mould sifted and strewed ouer with riddles an inch thicke and no more: for if this grain be buried ouer-deep and furewed ouer, it is not able to break through against the weight of the earth, but in stead of rising vp, the new chit turneth and benderth backward vnder the ground. And hereupon it is that folke forbear either to go at all vpon it, or else they tread very lightly. Being thus sowed, it must be gently watered for three daies following, after the Suns setting, (that the earth may drinke equally in **E** all places) vntill the sprouts appeare aboue ground. Now, after they haue had a yeares growth, they be translated and re-planted againe in rewes: for by that time they are come to a span or nine inches in height: but great care must be had that the time be temperat, that is to say, that the weather be fresh and faire without any wind. Certes a wonderfull thing it is to be spoken, that all the danger or security of this tree, standeth vpon the choice of that only day wherein it is replanted: for let there fall neuer so smal a rain or dew, nay let the wind blow neuer so little, it is a great hasard whether it will die. For euer after it is warished and safe enough, howbeit it cannot abide a glut of rain at any time following. Moreover, as touching Iuybes, they are likewise set of their graines in the moneth of Aprill. But that kinde of Peaches or Abricors which be called Tuberes, loue better to be grafted either vpon a skeg or wilde Plum-stocke, or **F** Quince, or else vpon the wild Hart-Rhamme, called Calabrium, [or Spina Cervina.] To knit vp this discourse, the fruit Sebesten and the Seruises may be grafted and planted both vpon the same kind of stocke: and looke what will beare the one, is apt to receiue the other.

CHAP.

CHAP. XI.

¶ The manner of translating or replanting out of one seminarie or nource, vnto another. How Elmes are to be planted. Also as touching trenches.

Some would haue vs to remoue plants out of one seminarie into another, before they be set indeed where they should be for to continue: which me-thinkes is a matter of more toile and curiositie than necessitie, howsoeuer they make promise, that by such transplanting, the leaues will proue larger and broader.

Now for Elms, their seed or grain is to be gathered about the * Calends of March, when it beginneth to turn yellow, and before the leaues break forth. After it hath bin dried in the shadow for two daies, it is to be sown thick in a plot of ground well broken vp and laid hollow beforehand, and then must there be mould searced ouer through a fine riddle, to the same thicknesse as we haue appointed for the Cypres. In case no raine do fall in due time, it ought to be watered by hand. After one yere, the plants that come herof must be taken vp out of the trenches and ranges wherein they came vp, and translated directly into the Elme plots where they are to grow; with this care & good regard, that they stand a foot at least euery way distant one from another. As for the male Elmes, vnto which Vines are wedded, because they are without seed, it is better they were planted in the Autumne: and for that they want seed they would be set of plants. Here with vs about Rome tude they vse to replant them again in their groue-plots when they be five yeares old, or as fone would haue it, so foon as they be come to 20 foot in height. The maner whereof is this, in a trench or ditch called * Nouenarius, 3 foot deep in the ground, and as many broad, or rather more, they are set: which done, for three foot in height euery way about the foot of each tree from the ground as it stands, there must be banks raised of some earth, after the maner of those seats which they cal Arulæ in Campanie. As for the spaces between tree and tree, they ought to be set out and disposed according to the nature and scituation of the place, and as the ground wil giue leaue. In the champion and plain country, those would be planted that are of a drier nature, and likewise in a thinner course. As for Ashes and Poplars, because they make haft to spring, leafe, and bud out betimes, it is meet that their plants likewise were set and ranged with the first, that is to say, about the * Ides of Februarie; for they also grow of plants, and may well be replanted.

Now for the order of setting trees either in groves, hort-yards, or vine-yards, wee ought to follow the vsuall maner of checquer row, called Quincuncial, which is not so common, but it is also as necessarie: not only good to admit all kindes of winde to passe betweene, but also faire and pleasant to the eye, considering, that which way soeuer a man looks, there offer to his sight both the allies, and reues, directly ranged in order.

The Opiets or Wich-Hazels are sown of seed after the same maner as Elme: in like sort also are they to be remoued & transplanted out of their nource-plots, as if they were wild, drawn from the very forrests.

Moreover, aboue all things this would be considered, that a tree to be remoued ought to be translated either into the like ground from whence it came, or else into a better. For we must take heed how we remoue plants out of warme grounds, & where the fruit is early ripe, into others that be colder or late in ripening. Semblably, out of cold & hard places, they would not be translated into warm, mellow, and forward. Item, if it be possible, let the trenches be cast and digged so long before, that a good thicke green sould be ouergrowne against the time that you mean to plant. *Mago* is of opinion, That the said trenches should stand made a yere before at the least, that they might be fully seasoned with the Sun, and receiue all rain, winde, & weather thoroughly. But in case it fall out otherwise, that the opportunitie thereof be ouerslipped, or our leifure wil not serue, he would haue fires to be made in the midft of them two moneths before, and in no case any trees to be set but after showres of rain. And if the ground be rough or hard, and standing vpon the cley, the ditches ought (according to *Mago*) for to be three cubits deepe euery way: and if they be to plant plum trees, he would haue them be a hand-bredth more, or spanne in deapth, and digged on euery side hollow, and vaulted in manner of a founaine, with a narrower mouth in the top. In a blacke veine of ground, by his direction, it is sufficient that they be two cubites and a hand-breadth or spanne deepe, and made foure-square in man-

ner

A ner of a quadrangle. In the measure and proportion of these ditches, the Greeke writers doe accord in one, saying, that they ought not to be more than two foot and a halfe deepe, nor wider than two foot bare also, that in no place it must be vnder a foot and a halfe deepe, for that in a moist soile, we shal come ordinarily neer to water about that skantlin, and not before. But *Cato* is of another judgment, if (quoth he) the place be waterish, let the trenches be three foot broad in the mouth, but in the bottome not aboue a foot and a hand-breadth, but see they be foure foot deepe: provided alwaies, that they be * paved beneath with stone: and for want thereof, laid with green willow bastons, and for default of them, with vine cuttings, or such triouffe, so that they lie halfe a foot thicke. But considering the nature of trees wherof we haue before written, I think it not amisse to adde somewhat of mine owne, namely, The more ebbe that any roots of trees creepe vnder the ground, the deeper they must be set into the earth, as for example, the Ash and the Oliue tree: for they and such other like ought to stand foure foot deepe. As for all the rest, it skils not, if they goe no deeper than 3 foot, for that is thought sufficient. [Stocke me vp this root here (quoth *Papirius Curs* for a Roman in General, in a brauery, when he meant to terrifie the Pretors of the Prænitines.) Whereby it is plain that the more secure & safe way in his judgment was rather to cut the stocke and maister Root indeed, than slightly to pare away those bare roots that appeare naked aboue ground; for that might be done, and the tree neuer the worse for it.] Some there be that would haue round pebble stones laid in the bottome of such ditches, which might as wel contain and keep water, as let it forth and giue issue thereto: whereas broad flat stones would not so doe, but besides, hinder the root that it should not goe downe and take hold of the earth. For to keep therefore a meane betweene, it were good in mine opinion, to lay grauell vnder the root.

Moreover, there be diuers men of this mind, that a tree should not be remoued, either vnder two yeares old, or aboue three: whereas others make no question to transplant them after the first yere, without more adoe. *Cato* alloweth not of translating a tree, vnlesse it beare in thicknesse more than 5 fingers. And verily, so exactly hath he written hereof, that he would not haue forgotten, to marke in the barke of trees the South side, before they were taken vp, in case, hee had thought that it was material to the replanting of them, that they should stand just in the same position and accustomed coast of the heauen, as they did before, for feare least that side which regarded the North, if now it should be opposed against the South, might cleaue and rift with the heat of the Sunne, not vsed thereto: and contrariwise, the parts which looked Southward, might now by the Northern winds, be clunged and congealed withall. Now there be some that affect a cleane contrarie course, and namely, in the Fig tree, and the Vine, exchanging the one side for the other: being fully persuaded, that by that means they will beare leaues thicker, preserve and defend their fruit better, and in the end shed fewer: more particularly, that the fig tree thereby wil be the * more easie to climb. Most men take great heed of this only, that when they prune trees, and cut off the top ends of boughes, the cut may be toward the South, without any regard or consideration, that in so doing they expose the boughs to the danger of cleaving, by reason of the hote Southern wind which lieth vncessantly beating vpon them. Yet hold I rather with them, that would haue branches cut Southeast or Southwest, namely, toward the points where the Sun is, at the fift and eight houres of the day. Another secret there is besides, wherof they are as ignorant, howbeit, not to be neglected, namely, to beware that the roots of such trees as are to be replanted, stay not long aboue ground, and thereby wax drie also, that trees bee not digged vp, either standing into the North, or in any quarter between that point and the Southeast, where the Sunne riseth in midwinter, in case the wind sit in those corners: or at leastwise, that the roots be not exposed bare against any of those winds: for surely, many a tree dies hereby, and husbandmen neuer know the cause thereof. *Cato* utterly condemneth all maner of winds whatsoeuer, yea, and raine too, all the while that trees be in remouing. Moreover, in this case it is singular good, that there hang to the roots of these trees, when they be translated, as much of the old earth wherein they liued and grew before, as may bee, yea, and (if it were possible) to bring them away with the turfs whole and entire, lapped fast about the roots. And therefore *Cato* provided wel, that such yong plants should be caried in baskets, earth and altogether with the roots. Doubtlesse, not without very great reason there is one Author saith, That it is sufficient that the vppermost course of the old mouth that lay at the foot of the tree, should be put vnder the root thereof now when it is replanted. Some write, that if the bottome of the hole or

grauce

* It seems that *Cato* meant of trenches to drain water out of low grounds: and not as *Pliny* mistaketh.

* *Scantlin*, reading it *Scantlin*, book 16 for *Scantlin*, or *Scantlin*, (i.) more or less and in full.

* The first of March.

* Nine foot distant euery way from another, for trees were planted ordinarily with that space between: as may appeare in the next chapter.

* The 23 day of Februarie.

graue be pained with stone where Pomegranate trees should stand, the Apple or fruit that they bear, wil neuer burst nor cleaue vpon the trees. Also, that the roots of trees when they are to be set, should be laid bending at one side, and not stand direct and streight. Moreouer, that the tree in any case be set iust in the mids of the ditch or hole made for it. It is said moreouer, that if a man plant a fig-tree, together with the sea-onion, Scilla (that is a kind of the Bulb) it will make haist to bear Figs, and those wil not be subject to the worme: and yet other fruits will be worm-eaten neuertheless, set them with the said Scilla as well as you can. As for the roots of a tree who makes any doubt, that great care should be had in the taking of them vpon so as they might seeme rather drawn forth gently, and not plucked vp violently. But my purpose is not to dwell in these matters, nor to stand much vpon such points, which haue a manifest reason, and wherof no man is ignorant or doubtfull; to wit, that the earth is to be well driuen and beaten downe close with a rammer, that it may lie fast about the roots, which *Cato* judgeth to bee a principall point for to be obserued in this businesse: who also giueth a rule, that the place where a tree is cut in the body, should be plaistered ouer with dung, couered ouer also, and fast tied with leaues.

CHAP. XII.

¶ *Of the spaces and distances that ought to bee betwene trees planted: of their shadowes and droppings: of the place where they should be planted.*

IT belongeth to this place properly for to speak of the distances between tree and tree, in the setting. Some writers are of opinion, That Pomgranat trees, Myrtle trees, & Lawrels, should be planted thicker than ordinarie, howbeit, with this regard, that they be set 9 foot asunder one from another. As for Apple trees, they may stand a little more at large, Peare trees somewhat wider than they, Almond trees, and Fig trees yet a little more than all the rest. But herein must we be ruled & directed by the boughs spreading more or lesse, by the room of the place it selfe, and according to the shadow that each tree casteth. There is not (I say) any one of these considerations to be neglected, and the shade especially of all others would be obserued. For such trees as branch round as it were in compasse, although they be otherwise great, as namely Apple trees, and Pyrries, yet they yeeld no great shadow: whereas a man shall see Cherry trees and Lawrels take vp an exceeding deale of ground with their shade. Now these shadowes of trees haue their properties by themselves, for that of the Walnut tree is noisome and hurtfull euē to man, breeding heauinesse in the head: and an ill neighbour it is besides to all plants either vnder or neere vnto it. The Pine tree also with her shadow nipeth and killeth the yong spring of all plants within the reach thereof. Howbeit, both it and also the Walnut tree resist the force of winds notably, and therefore they serue in good steed to protect vineyards, and are projected against the winds to breake their violence. The dropping of the Pine, Oke, and Mast-holme, by reason of the raine water wherewith they are much charged, is very heauy and ponde-rous, and therefore hurtfull. As for the Cypress tree, it droppeth little or nothing, by reason that it receiueth so small a deale of rain: and in truth of all others the shade is least, the boughs are knit and trust so round, and run vp sharpe pointed in the top. The Fig tree giueth no thicke shadow, howeuer the boughs spread large ynough; which is the cause, that no man forbiddeth the planting of them in Vineyards among Vines. And as for Elmes, their shade is so milde and thin, that it nourisheth whatsoeuer it ouerspreads vnder it. Howbeit, *Atticus* is of opinion, That the shadow of Elmes is one of the thickest and most hurtfull: neither doe I make any doubt thereof, if they be let to spread into great armes and boughes at liberty: marie, if the branches thereof, or if any tree within-forth be shrugged, I thinke that the shade will doe no harme at all. The Plane tree carieth a heauie head, and therefore casteth a thicke shade, howbeit, pleasant it is, and refreshes those that sit vnder it: safe resting there is vpon the grasse, rather than the bare ground: and there is not a tree againe where grasse groweth thicker and longer, to couer the banks and seats vnder it. As for the white Poplar or Aspen tree, it maketh little or no shade at all, the leaues keep such a wagging & trembling, and neuer hang still: the shadow of the Alder tree is fat and battie, it feeds whatsoeuer is sowne or set vnder it. The Vine hath shade ynough to serue her owne turne: the leaues are euer stirring, and by their motion and turning often too and fro, there is a good temperature of shade and Sunne by that means: they serue also in steed of a couert in time of raine, and beare off a good shower. Generally, all trees in manner that haue

A haue their leaues hanging by a long taile, cast but a light and slender shadow. And truly the knowledge hercof would not be contemned, nor set in the last place of such points as belong to husbandrie, considering there is not the shadow of any one tree, but either is a kind nource, or a shrewd and curst step-dame, that is to say, either profitable or incommodious to all the fruits of the earth. For without all question, the shade of Walnut trees, Pine trees, Pitch trees, & firs is no better than poison to all that is within the compasse of it, and kills whatsoeuer it toucheth. And thus much of Shadowes.

As touching the dropping of trees, a man may conclude in one word all that belongs thereto. For looke what trees soeuer be so defended and clad with thick leaued branches, that the raine cannot passe readily through them, be sure the dropping and diffillation of such is naught and dangerous. And therefore it skilleth very much in this matter and question now in hand, to know the nature of the earth wherin we meane to plant, how many trees it may well bear and nourish. As for hills, they require of themselves not so great distance betwene tree and tree, as the plaines beneath: besides, in such places exposed to the wind, it is good that they be planted thicker. Howbeit, Oliues require the greatest space between of all others: and therefore *Cato* following the judgment of all Italie, ordaines in these words, That they should stand asunder five and twentie foot at the least, and thirtie at the most: but this rule holdeth not alwaies, for herein guided we must bee by the nature and site of places, which varie and differ much. For in *Beetica*, which is a part of Spaine, there is not another tree growing bigger than the Oliue: and if we may giue credite to authors that haue written hercof, there bee in *Affricke*, by their report many of them called *Milliariae*, for that euery yeare they yeeld a thousand pound weight of oile; apeece. And therefore *Mago* allowed threescore and fifteen foot euery way, for distance between Oliue trees, or else five and forty at least, euē in leane and hard grounds, and those that were exposed to the winds. And in *Beetica* verily, the people vse to reap great plenty of corn among Oliue trees.

Now of all other follies this is one, and bewraith shamefull blindnesse and ignorance, To be driuen to make glades between trees when they be grown to a good bignes: and namely, either by lopping their boughs too much for to let in light between, and so by this means to hasten their age and decay; or els to draw them by cutting them downe cleane: wherin oftentimes they that did set them at first, take themselves in the manner, and blame their own want of skill. D Considering therefore, that there is no greater shame can happen to husbandmen than to repent when a thing is done, and then goe about to vndoe it, much better it is of the twain in this case, to fault in ouerwise, than too streight roume.

CHAP. XIII.

¶ *What trees grow but slowly: and which they bee that soone come forward: also, of the Saine.*

SOME trees by nature are slacke of growth, and principally those that come of seed, and liue longest. But such as soone decay and die, are quicke of growth, as the Fig tree, Pomegranat tree, Plumme-tree, Apple-tree, Peare-tree, Myrtle, and Willow: but they make amends for their short life in this, that they goe before others in fruit, and enrich their masters quickly, for they begin to beare well at three yeeres age, yea, and they make a shew thereof in their blossom before. Of all these the Pear-tree is the slowest. But the Cypress, as wel the true & legitimat as the bastard (which is a shrub called *Pseudo. Cypress*) come fastest forward of any other, for they beare at first both blossome and fruit. This is a generall thing obserued, That all trees will thrive and prosper better, yea, and grow sooner to perfection, if the shoots and suckers that put out at the root, as also other water twigs, be rid away, so that all the nourishment may be turned to the principall stocke only.

The work of Nature in sending out these sprigs, taught vs the feat to couch and lay sets in the ground by way of propagation: and euē after the same manner briars and brambles doe of themselves put forth a new off-spring: for growing as they do, smal and slender, and withal running vp to be very tall, they cannot chuse but bend and lean to the ground, where they lay their heads againe, and take fresh roor of their owne accord without mans hands: and no doubt, ouer-grow they would and couer the whole face of the earth, were they not repressed and withstood by

by good husbandrie. The consideration whereof maketh me to enter into this conceit. That men were made by Nature for no other end but to tend and look vnto the earth. See yet what a commodious deuice we haue learned by so wicked and detestable a thing as this bramble is, namely, to lay slips in the ground, and quick-setts with the root. Of the same nature is the Yuiue also, euen to grow and get new root as it creepeth and climbeth. And by *Cates* saying, not onely the Vine, but Fig trees & Oliues also, wil grow & increafe of cuttings couched in the ground; likewise Pomegranate trees, all kinds of Apple-trees, Baies, Plum-trees, Myrtles, Filberds, Hazels of Præneste, yea, & Plane-trees. Now be there two waies to increafe trees by way of propagation or entering their twigs. The first is, to force a branch of a tree as it grows, downe to the ground, & so to couch it within a trench foure foot square euery way; & after two yeares to cut it arow, where it bent from the tree; and after three yeares end to transplant it. But if a man list to haue such plants or young trees to beare longer, the best way were to burie the said branches at the first within mould, either in paniers or earthen vessels, that when they are once rooted, they might be removed all whole and entire in them, and so replanted. The second is a more curious and wanton deuice than this, namely, to procure roots to grow on the very tree, by carrying, and conueighing branches, either through earthen pots or oisier baskets, full of earth, thrust close to the said branches; and by this means, the branches feeling comfort of the warme earth enclosing them on euery side, are easily intreated to take root, euen among Apples and other fruits, in the head of the tree, (for surely by this meanes we desire to haue roots to chuse, growing vpon the very top.) So audacious are men and of such monstrous spirits, to make one tree grow vpon another, far from the ground beneath. Thus in like manner as before, at 2 yeares end, the said imps or branches that haue taken root, be cut off and carried away in the foresaid pots or paniers; thither where they shall grow. As for the Sauine, an hearb or plant it is that wil take if it bee in this sort couched in the ground; also, a sprig if it be slipped off cleane from the stocke, will come again and root. Folke say, that if a man take wine lees, or an old bricke out of the wall broken small, and either pour the one, or lay the other about the root, it wil prosper and come forward wonderfully. In like manner may Rosemarie be set as the Sauine, either by couching it, or slipping off a branch from it, for neither of them both hath any feed. To conclude, the hearb or shrub Oleander, may be set of any impe, and so grow, or else come of seed.

CHAP. XIII.

¶ *Of encreasing trees by seed: the manner of grafting one in another: how the fine deuise of inoculation by way of scutcheon and emplaster was deuised.*

Nature not willing to conceal any thing from man, hath also taught him to engraft trees with their seed and graine. For oftentimes it happeneth, that birds being hungrie, haue greedily gobbled vp seed and fruit whole and sound, which after they haue moistened in their gorge, and tempered it also with the warmth and natural heat of their stomach, they send forth and squirt out again when they meute, together with their dung, that giueth vnto it a vertue of fecunditie, and so lay it vpon the soft beds of tree leaues, which many a time the winds catch and driue into some clifts and cranies of the barke, by meanes whereof, wee haue seene a Cherrie tree vpon a Willow, a Plane tree vpon a Lawrell, a Lawrell vpon a Cherrie tree; and at one time Berries and fruits of diuerse sorts and sundry colors hanging at one and the same tree. It is said moreover, that the Chough or Daw hath giuen occasion herof, by laying vp for store, seeds and other fruit in creuises and holes of trees, which afterwards sprouted and grew. From hence came the manner of inoculation or grafting in the scutcheon, namely, to cut out a parcel of the barke of that tree which is to be grafted, with a sharp knife made in manner of a shomakers nall blade; and then to enclose within the said concavity, the eie or seed taken out of another tree with the said instrument. And in old time verily this was the only maner, of inoculation vsed in fig-trees and apple trees. *Virgil* teaches vs to open a concavity in the knot or joint of a bud that driueth out the barke, and within it to enclose the gem or bud taken out of another tree. And thus much for the grafting that Nature hath shewed.

But there is another way of grafting, which casualtie and chance hath taught. And to say a truth, this Maister hath shewed well neer more experiments, now daily practised, than Nature her selfe. Now the manner of it came by this occasion. A certain diligent & painfull husbandman,

A man, minding to mound and empale his cottage round about with a fence of an hedge; to the end that the stakes should nor rot, laid a sill vnder them, of Iuue wood: but such was the vitall force of the said Iuue, that it took hold fast of the stakes and clasped them hard, inso much as by the life thereof, they also came to liue; and euident it was to the eye, that the log of Iuue vnderneath, was as good as the earth to giue life and nourishment vnto the stakes afore-said.

To come then vnto our grafting, which we haue learned by this occasion: first, the head or vpper part of the stock must be sawed off very euen, and then pared smooth with a sharp garden-hook or cutting-knife: which don, there offers vnto vs a two-fold way to perform the rest of the worke: The first is, to set the graffe or Sion between the barke and the wood: for in old time truly, men were afraid at first to cleaue the stocke; but soon after they ventured to bore a hole into

B the very heart of the wood: and then they set fast into the pith just in the mids thereof, but one Sion or graffe, for by this kind of grafting, impossible it was that the said pith should receiue or beare any more. But afterwards they deuised a finer and more subtile inuention to graffe, by cleauing the stocke gently thorough the mids; and after this manner they might well set into it six imps or Sions at once: as being persuaded, that by such a number they might supply the defect of any, if they chanced to die or miscarry any way. Now when the said clift was made, they held it open with a wedge of wood put between, untill such time as the impe or graffe being thwitted thin and sharp beneath were set hand somely close within the rift. In the practise of which feat, many points are to be obserued: first and foremost, it would be considered, what trees will thus sort together and be vnited; namely, what stock will beare this maner of engrafting, and of what tree an impe or Sion will agree well to be set into it: for be ye sure of this, all trees are not alike, neither haue they all their sap in one and the same part. Vines and Fig trees are drier in the mids of the tree, than in the head; and toward the top they are more apt to take and conceiue, and therefore from thence it is good to make choise of imps to be grafted. Contrariwise, the sap of Oliues is most frim about the mids, and from thence they afford Sions; for the tops are drie. Moreover, soonest of all other doe those trees incorporate one into another, if when the stock and graffe haue barks both of one nature, if they blossom together at one time, if they bud and put forth their spring at the same season, and last of all, if their saps doe agree one with another. On the other side, long it wil be ere they take, when the stock is drie and the graffe moist; or when the barke of the one is tender, and of the other tough and hard.ouer and besides, carefull heed must be taken in this businesse, that the stocke be not clouen in a knot;

C for the churlish hardnesse thereof will not willingly receiue and entertaine a guest, that choise also be made of the smoothest and fairest place in the stocke, where the graffe would be set: *Item*, That the clift be not aboue 3 fingers deepe; that it be streight and direct; and lastly, that the impe stand so close barke to barke in the socket, that a man may not see between it and the stocke. *Virgil* will in no wise haue a Sion or graffe to be taken from about the top of a tree, for such are all naught. But this one thing is generally held for certain, That the good imps to bee grafted are those, which be gathered from those armes of the tree that regard the Sun-rising in summer: *Item*, That all such grafts come from the boughs that beare well: also that they be new tender shoots of the last yeare (vnlesse they are to be grafted in the stock of an old tree, for then there should bee chosen such as are stronger:) moreover, this is to be regarded, that they be well budded, yea and knotted too, making shew and giuing good hope euen then, that they would bear fruit the same yere, but in any wise the same ought to be of 2 yeres growth at least, and not smaller beneath toward the stocke than a mans middle finger. As for the graffes, the manner is to set them in the stocke with the lesser end downward, when our purpose is, that the tree should spread rather in breadth, than run vp in height. Aboue all, it would be looked wel to, that they be neat and bright, so as they shine againe; that no part of them be seene either scorched drie with the sunne, or cicatrized (as it were) and blistered. Good hope there is that the graft will take, if the pith or marrow of the sion do fall jump with the joynt, so as it ioyne close to the wood and inner barke of the mother stocke: for this is farre better than to let it meet just

E and euen with the bark without-forth. Moreover, a carefull eie must be had in thwitting and sharpening the graffe or imp, that the heart or woody substance be not stript all naked and left bare: howbeit gently and with a light hand a man must go ouer it with a fine and sharp instrument, in such sort, as it may go downe into the clift wedgewise, no deeper than 3 fingers bredth: the which may right easily be don, if it be shauen and pared presently after it hath bin dipped

in water. Moreover, wee ought be well aduised, that wee sharpen not the end of a graffe in the wind, and that the barke goe not either from it or the stock. As for the graffe it selfe, it must be driuen downe into the clift, close to the shoulder where the owne barke goeth round, and from whence you began to sharpen it: but take heed in thrusting and forcing therof, that it stand not out of joynt, ne yet that the barke thereof turne vp in wrinkles: and therefore chosen they would not be which are ouer moist, no more (I assure you) than those that be too drie, for as the excessive humiditie of the one looseth the rind, so the want of vitall moisture in the other, will not suffer it to vnite & conuincorporat. Ouer and besides, in the working of this feat, men obserue a certain religious reuerence, namely, that the fions be set into the stocke when the moone is croissant (to wit, before the full) and with both hands forsooth, or els all is marred: and otherwise in this businesse there is an opinion, that two hands together are put to smaller streffe, and haue better stay of themselves than one alone; and therefore such a moderation is right necessarie: for the more forcibly the graffes be set into the stocke, and the faster that they are settled, the longer it will be ere they take to beare, but surer they be, and continue the longer: contrariwise, if they stand slacke, the tree indeed will the sooner beare, but last the lesse while. Furthermore, regard would be had in this case, as well that the clift of the stocke gape not too much (as being ouerwide for the graffe,) as that it be not too little and ouer-straight, for feare that either it flurt it out againe, or clasp it and gird it so hard that it kill it quite. This principally we must take heede of at the first, that there be no spill or little chip left behind in the mids of the clift, nor any thing besides the graffe it selfe, to fill vp the place. Some there be, that enter the clift first in the stock, with a bill, and with an oser twig tie and bind vp the very brims or edges therof: which done, they driue the wedges in, to make such an ouerture as is meet, for by reason of the foresaid bonds, they need not feare the gaping of it too wide. Some stocks there be that the very same day that they be grafted in the nource garden, are without any harme remooued to the place where they must grow. If the stocke wherein you graffe be big and round, the best way is to set the fion between the barke and the wood therof, and to diuide the one from the other with a wedge of bone, least in enlarging of the barke it chance to breake. In grafting of a Cherry tree stocke, the ouer rind or barke would be taken away before the clift be made. [Now these trees alone of all others may be grafted very well presently after mid-winter.] When the said rind is gone, you shall see therein a certain down, that if it chance to clasp about the graft, it rots the same incontinently. But to return again to our worke of grafting: After the wedge is taken forth whole and sound at the point (which is a token that no spill remains within) you may be bold to bind the head of the stocke all about. Yet this would be considered by the way (which I had like to haue forgotten) that the best & handsomest grafting, is as neere the ground as may be, in case the knots will giue leaue and the stock beare it: also that the grafts would not conueniently stand without the stock about six fingers breadth. Now when al is done and sure work made (as hath been said) *Cato* willet vs to take cley, or the sandie grit of chalk, mixed together with oxe or cow shearn, to worke and temper all these together in maner of a tough past or cataplasme, and then to lay the same within the clift, & round about to daube all. And verily by this and other such rules which he hath left in writing, it appears plainly, that in those daies the manner was to graffe betweene the barke and the tree, and not otherwise; as also to set the fions in the stocke, not about two fingers deepe. As for Apple trees and Pyries, he prescribeth that they should be grafted in the Spring, also 50 daies after the summer Sun-stand, and again after vintage: but Oliues and Fig-trees in the Spring only, obseruing the age and disposition of the Moon, when she is in the wane and thirtieth, that is to say, drie: moreover, after noonetide, and when no Southern wind doth blow. And I cannot chuse but wonder much at the curiositie and double diligence of *Cato*, who not content to haue defended the graft with clay or past afore said, yea and to preferue it with turfe and mosse against the iniurie of rain and cold, to haue bound it about also with little knitches of soft oser twigs sluied in twaine; must giue charge besides to couer it with Oxe-tongue (a kind of herb there is so called) i. Buglosse: and yet hee hath not done, but the same must be bound with wispes and wreaths of straw and litter aloft. Now adaeies men make no more adoe, but thinke it sufficient to stop and close vp barke and al, with earth or cley and chaffe tempered together, thinking it sufficient, the graft beare out two fingers breadth about. They that wait vpon the Spring season for to graffe, are many times driuen to their shifts for want of time, by reason that all trees make hast then to bud, and do break

out

A out of a sudden, vnlesse it be the Oliue, the oilers or eies wherof be longest while in coming forth, as hauing least sap of all other, running vnder the barke; the which if it were ouermuch would fiske and choke the grafts. As for the Pomegranat and Fig tree, howsoeuer otherwise they seem to be dry, yet good it is not to defer and put off the grafting of them. The Pearre tree may well enough be grafted with the blossom on the head, and it makes no matter if a man do stay and graffe it within the moneth of May. To be short, if a man be constrained to fetch his fions or imps of Apple trees, and such like, far off, it is thought that they will keepe their sap best, if they be stuck or set fast in a Rape root. Also if one would preferue them a certain time before they should be occupied, it is passing good to lay them close betweene two ereft tiles, well stopped on euery side with earth, and that neere to some riuers or fish-ponds.

B CHAP. XV. ¶ The manner how to graffe a Vine tree.

A S for the cuttings or sets of vines, they may be kept wel a long time, couered all ouer with straw or litter in dry ditches; and afterwards they are to be laid within the earth, all billed or couered, saue only that their heads be seen aboue ground. *Cato* graffeth a vine stock three maner of waies: First, he willet that the mother stock should be cut ouerthwart, & then clouen through the very pith or heart in the mids, wherein he would haue the yong imps (thwitted and sharpened as is before said) to be set and ingrafted so, as the marrow of the one and the other may ioine and meet iust together. The second maner is, when two vine stockes doe reach one to the other, for to cut byas or allaunt (after the manner of a goats foot) two twigs or branches, of either one, with this regard, that these cuts be of a contrarie side the one vnto the other, and withall so deep, as that they come vnto the pith or heart: then to fit one to the other, ioining pith to pith, and then binding them fast together so close, that no aire may enter between, vntill such time as the one hath adopted the other. The third deuise is, to bore holes in an old vine, not directly, but aslope, as far as to the pith; and then to put into them yong imps 2 foot long, and to bind them fast: which done, to make a certaine batter or mortar [with clay, beasts dung, and sand together] and therewith to dawbe the place: but with this regard, that the graft stand halfe vpright, or somewhat leaning. This manner of grafting hath bin checked and corrected of late daies by our countrymen, who leauing the hand-piercer, haue taken the French Vibrequin or brest-wimble, which gently and quickly boreth a hole, and hurteth not the wood: for all chafing heate caused by the said piercer, dullerth the vigor both of stock and imp. Also they haue deuised, that the said imp to be ingrafted, be gathered from the tree when it begins to bud or burgen: and when it is set into the stocke, that it be left standing out with no more than two eies or buds out of the grafting place; that it be well bound also with the winding rods of an Elme: moreover, that on either side of it the mother stock be slit or cut in two places on both sides, to the end that from thence rather than otherwise, the waterish humour may distill and drop forth, which of all things hurteth vines most. After all this, they would haue the said graffe remain bound, vntill such time as it haue put forth shoots two foot long; and then the foresaid bands to be cut in sunder, that they may burnish in thicknes and at ease accordingly. The season which they haue allowed for to graffe vines, is from the Equinoctial in Autumne, vnto the time that they begin to bud forth. Generally all trees that are tame and gentle may wel be grafted into stocks and roots of the wild, which by nature are dryer: contrariwise, graffe the wild and sauage kind vpon the other, you shal haue all degenerate and become wild. Touching other points belonging to the feat of grafting, all dependeth vpon the goodnesse or malignitie of the sky and weather. In sum, a dry season is good for all trees grafted in this maner: and say that the drought were excessive, there is a good remedie for it, namely, to take certain earthen pots of ashes, and to let water distill through them softly, by little and little to the root of the stock. As for inoculation, it loueth small dewes otherwhiles, to refresh both stock, scutcheon, and Oiler.

CHAP. XVI.

¶ Of Emplastration or grafting with the Scutcheon.

F The manner of grafting by way of emplastre or scutcheon, may seme also to haue come from inoculation: and this deuise agreeth best with those trees that haue thick barks, as namely Fig trees. To goe therefore artificially to worke, the mother stocke or tree to be grafted,

Y y 2

grafted,

grafted, must be well rid and clenfed from the branches all about the place where you mean to practise this feat, because they should not suck the sap from thence; and chuse the neatest and frimmet part, which seems most fresh and liuely: then cut forth a scutcheon of the barke [but be careful that your instrument pierce no farther than the bark, nor enter into the quick wood] which done, take from another tree the like scutcheon of the bark, sauing the eye or bud thereon, and set it in the place of the other; but so equall this must be to the place, and so close ioyned and vnted to it, that a man may see no token at all or apparance in the ioyn, of any wound or skar made, to the end, that presently they may conorporat, that no humor of the sap may issue forth, nor so much as any wind get between: and yet to make sure work, the better way is to lute it well and close with clay, and then to bind it fast. This deuice of grafting thus with the scutcheon was but lately found out, by their saying, that fauor all new and modern inuentions: howbeit I find that the antient Greeks haue written thereof: yea and *Cato* also our own Countryman, who ordained to graffe both Oliue and Fig tree in that order: and (as he was a man verie diligent and curious in all things that he tooke in hand) he hath set downe the iust measure and proportion of the scutcheon; for he would haue the barks both the one and the other, to be cut out with a chissell foure fingers long, and three in bredth, and so to close vp all in manner aforesaid, that they might grow together; and then to be dawbed ouer with that mortar of his making aforesaid: after which manner Apple trees also may be grafted.

Some there be who haue intermingled and comprehended vnder this kinde of grafting with the scutcheon, that deuise of making in the side a cleft, and namely in vines; for they take forth a little square piece with the bark, and then set in an impe very hard & close, on that side where it is plain and euen, to the very marow or pith. Certes, neere to Thulie in the Tyburtines country, I haue seen a tree grafted all these waies abouesaid, and the same laden with all manner of fruits; one bough bearing Nuts, another berries, here hung Grapes, there Figs; in one part you should see Peares, in another Pomegranats; and to conclude, no kind of Apple or other fruit, but there it was to be found: many this tree liued not long. Howbeit, let vs vse what diligence we can, yet neuer shall we able with all our experiments to attain vnto the depth of Natures secrets. For some Trees there be that come vp of themselves, and by no art and industry of man wil be made to grow: such also loue ordinarily to be in wild forests and in rough desarts, where they prosper well; whereas the Plane tree wil beare all manner of grafting best of any other; and next vnto it the wild and hard Oke: but both the one and the other corrupt and mar the tast of what fruit soeuer is grafted thereupon. Some trees there be that refuse not to be ingrafted vpon any stock, and what way soeuer they be grafted it skils not, as fig trees and Pomgranat trees. As for the Vine it will not beare the scutcheon, neither any Tree besides that hath a thin barke, or which doth pill and rift: no nor such as be dry or haue small store of sap within them can away with inoculation. Howbeit this maner of grafting is most fruitfull of all other; and next vnto it that which is done by way of scutcheon or emplaistre: yet trees so grafted be of all others most tender and feeble: as also such as rest and stay vpon the bark only, are with the least wind that is, soonest dispianted and laid along on the ground. The surest and strongest way therefore is, to graffe imps vpon the head of a stocke, yea, and more plentifully by far, than to sow them of seed, or plant them otherwise.

CHAP. XVII.

¶ An historie shewing the example and prooffe hereof.

IN this discourse and question concerning grafts, I cannot passe ouer the rare obseruation of one example, practised by *Corellius* a Knight of Rome, borne at Atefe: This Gentleman of Rome, in a ferme that he had within the territorie of Naples, chanced to graffe a Chestnut with an imp cut from the same tree: This graft tooke and bare faire Chestnuts and pleasant to the tast, which of him took their name. After the decease of this gentleman, his heire (who had bin sometime his bond slaue, and by him enfranchised) grafted the foresaid *Corellian* Chestnut tree a second time: and certainly between them both was this difference, The former *Corellian* bare the more plenty, but the nuts of the other twice grafted were the better. As for other sorts of grafting or planting, mans wit hath deuised, by obseruing that which hath fallen out by chance: thus are we taught to set broken boughs into the ground, when we saw how stakes pitched

A ched into the earth, took root. Many trees are planted after that maner, and especially the Fig tree, which will grow any way, saue only of a little cutting: but best of all, if a man take a good big branch thereof, sharpen it at the end in manner of a stake, and so thrust it deepe into the ground, leauing a small head about the ground, and the same couered ouer with sand. The Pomegranate likewise and the Myrtles are set of branches, but the hole first ought to be made easie and large with a strong stake or crow of iron. In sum, all these boughs ought to be made long, smaller in compasse than a mans arme, sharpened at the one end, and with the barke saued whole and sound with great care. As for the Myrtle tree, it wil come also of a cutting; the Mulberry will not otherwise grow: for to couch and plant them with their branches, we are forbidden, for feare of the lightnings. And forasmuch as we are fallen into the mention of such cuttings, I must now shew the manner of planting them also: about all things therefore regard would be had, that they be taken from such trees as be fruitfull, that they be not crooked, rough and rugged, nor yet forked; ne yet slenderer than such as would fil a mans hand, or shorter than a foot in length. Item, That the barke be not broken or rased; that the nether end of the cut be set into the ground, and namely, that part alwaies which grew next the root; and last of all, that they be banked wel with earth about the place where they spring and bud forth, until such time as the plant haue gotten strenght.

CHAP. XVIII.

¶ The manner of planting, ordering, and dressing Olive trees. Also which be the conuenient times for grafting.

WHAT rules (by the iudgment of *Cato*) are to be obserued in the dressing and husbanding of Oliues, I think it best to set downe here word for word, as he hath deliuered them. Thus he saith therefore: The trunches or sets of Oliue trees which thou meanest to lay in trenches, make them 3 foot long; handle them gently and with great care, that in cutting, sharpening, or squaring them, the bark take no harm nor pill from the wood. As for such as thou dost purpose to plant in a nourse-garden, for to remoue again, see they be a foot in length, and in this manner set them: Let the place be first digged thoroughly with a spade vntill it be well wrought, lie light, and brought into temper: when thou putttest the said trunchen into the ground, beare it downe with thy foot; if it goe not willingly deepe enough by that means, drive it lower with a little beetle or mallet; but take heed withall, that thou ruse not the barke in so doing. A better way there is, To make a hole first with a stake or crow, before thou set it into the ground, and therein maist thou put it at ease, and so will it liue also and take root the sooner: when they be three yeares old, haue then a carefull eye to them in any case, and marke where and when the bark turneth. If thou plant either in ditches or furrowes, lay three plants together in the earth, but so as their heads may stand a good way asunder about the ground; also that there be no more seen of them than the bredth of foure fingers: or els, if thou thinke good, set the buds or eyes only of the Oliue. Moreover, when thou art about to take vp an oliue plant for to set again, be wary and carefull that thou break not the root: get as many spurs or strings (called the beard) as thou canst, earth and all about them: and when thou hast sufficiently couered those roots with mould in the replanting, be sure thou tread it down close with thy foot, that nothing hurt the same.

Now if a man demand and would gladly know what is the fittest time for planting oliues; in one word I will tell him, Let him chuse a dry ground in seed time [i. in Autumne] and a fat or battle ground in the spring; furthermore, begin to prune thy Oliue tree 15 daies before the Equinox in the spring, and from that time forward for the space of forty daies, thou canst not do amisse. The maner of pruning or disbranching them, shall be thus, Looke where thou seest a place fertile, if thou spy any dry or withered twigs, or broken boughs that the wind hath met withall, be sure thou cut them away euerie one: but if the plot of ground be barren, care it vp better with the plough, take pains (I say) to till it well, to breake all clors and make it euen, to clense the trees likewise of knurs and knots, and to discharge them of all superfluous wood: also about Autumne bate the earth from about the roots of Oliues, and lay them bare, but in stead thereof put good mucke thereto. Howbeit if a man do very often labor the ground of an oliue plot, and take a deep stich, he shall now and then plough vp the smallest roots thereof, so ebbe

they will run within the ground, which is not good for the trees; for in case they spread aloft, they will wax the thicker, and so by that means the strength and vertue of the Oliue will turne all into the root.

As touching all the kinds of Olive trees, how may they be; also in what ground they ought to be set, and wherein they will like & liue best; likewise what coast of the heauen they should regard; we haue shewed sufficiently in our discourse and treatise of Oile. *Mago* hath giuen order in his books of husbandry, that in planting them vpon high grounds, in dry places, and in a vein of clay, the season should be between Autumne and mid-Winter: but in case you haue a fat, moist, or waterish soile, he sets down a longer time, namely from haruest to mid-winter. But this rule of his you must take to be respectiue to the climat of Africk only: for in Italy at this day, verily men vse to plant most in the Spring: howbeit if a man hath a mind to be doing also in Autumne, he may be bold to begin after the Equinox: for during the space of 40 dayes together, even to the setting of the * Brood-hen star, there are no more but 14 days ill for planting. In Barbarie the people haue this practise peculiar to themselves, For to graffe in a wilde Oliue stock, whereby they continue a certain perpetuity: for euer as the boughs that were grafed, and (as I may say) adopted first, wax old and grow to decay, a second quickly putteth forth afresh, taken new from another tree, and in the same old stock sheweth yong and liuely; and after it a third successiue, and as many as need; so as by this meanes they take order to eternise their Oliues; inasmuch as one Oliue plant hath bin known to haue prospered in good estate a world of yeares. This wilde Oliue afore said may be grafed either with sions set in a cliffe, or els by way of inoculation with the scutcheon afore said. But in planting of Oliues this heed must be taken, that they be not set in a hole where an Oke hath been stocked vp by the root: for there be certain canker-wormes, called *Eruca* in Latine, or *Rauca*, breeding in the root of an Oke, which eat the same, and no doubt will do as much by the Oliue tree. Moreover, it is found by experience better for Oliue trees, that their sets be not interred in the earth, nor yet dried, before they be planted. Also, the same experience hath taught, that for old Oliue trees, ouergrown with a kind of mossie skurfe, it is passing good, ech other yeare to scrape and claw them well, between the Spring and Equinox, and the rising of the starre *Vergilia* or the Brood-hen: likewise to bestow mossie round about the root: many euery yere they would be digged round about the root and laid bare after the sunstead, with a trench made two cubits broad, and a foot deep: as also once in three yeres it were not amisse to cherish them with good dung.ouer and besides, the same *Mago* saith, that almond trees ought to be planted between the setting of *Arcturus* and the shortest day in the yeare. As for Peare trees, they are not to be set all at one and the same time, for they blossom not all alike. They that beare either the long or round pears, haue their season from the occultation of the Brood-hen starre, vntill mid-Winter. All other sorts, and principally those that regard either the East or the North, are to be planted in mid-winter, namely after the retreat of the star called *Sagitta* [i.e. the Shaft.] The *Lawrell* would be put in the ground, from the *Egle*-star, vnto the fall of the Shaft afore said: for certainly the obseruation of the time, pertinent to the planting of trees, agreeth much what after this maner; and for the most part, men do accord and ordaine, That it should be done in the spring and Autumne especially. Another season there is about the rising of the Dog-starre, which few men take knowledge of, because it is not so generally practised, nor found alike profitable to all countries: howbeit I must not ouerpasse it in silence, considering that my purpose is not to speake of this or that countries disposition, but to search into the nature of all things. In *Cyrenaica* therefore, a region in Africk, they vse to set trees about the time that the *Etesian* Northern winds do blow: in Greece likewise they do the same, and namely in *Laconia* they suppose that to be the best time for the Oliue tree: & in the Island *Cos* the maner is then to plant Vines also. In all other parts of Greece they make no doubt to inoculate and to graffe in that season; but in no wise will they plant whole trees then. But herein it skilleth much to consider the nature of each tract and region: for in Egypt, they set, plant, and replant euery moneth of the yeare: in *Ethiopia* likewise, and India; and generally in all Countries wheresoeuer it raineth not in Summer. Setting these respects aside, Trees require of necessitie to be planted in Autumne. Like as therefore there be three seasons of planting Trees, so there are as many wherein they bud and put forth new shoots; to wit, the Spring, the rising of the Dog-starre, and the apparition of *Arcturus*. And verily this is a thing worthy to be noted, that not onely

* *Vergilia*.

A beasts and other liuing creatures haue an appetite to engender, but the earth also, and all the plants thereupon, are much more lusty and hot that way. And therefore to make them to conceiue in due season, the time would be well obserued, when they be as it were in loue, and desire the act of generation. And not onely in the earth and trees therein planted, is this to be seen; but in grafts and stocks also particularly by themselves, since that they haue a mutual and respectiue appetite, one to ioine and incorporate with the other. They that make choise of the Spring for this purpose, begin to put them as it were together for to engender, presently after the Equinox; giuing out in these plaine termes, that trees then are broody and ready to put forth sprouts; which is the reason, that their barks at such a time will knit and ioine together easily. But such as prefer the Autumne before the Spring, fall to this businesse immediately vpon the rising of the star *Arcturus*, for then they suppose, that plants will take root forthwith, & by the time that the Spring is come, they will be better prepared to put forth lustily; considering that their vertue is not streightwaies spent in budding, but rather imployed in taking good root. Howbeit, some trees there be that haue their set times and seasons of the yere limited; whether it be to plant or to graffe: and the same indifferently in all places; as namely, Cherry trees and Almond trees about the mid-winter. But for the most part, the situation of the place will be able to guid and order all this matter best: for cold and waterish grounds ought to be planted in the Spring; but dry and hot in the Autumne. With our peasants here in Italy, it is ordinary to diuide their times and seasons for planting in this manner following. They set out for the Mulbery all the time from the Ides of February to the spring Equinox: for the Pear tree they allow the Autumne, and so forward till 15 daies before the point of mid-winter, and no longer; for Summer apples and quinces, for Seruises likewise and plums, they assigne the space between the winter tropicke or Sun-stead, and the Ides of February. As for Carobes of Greece, and Peach trees, they haue all the Autumne and the whole yere before them vntill mid-winter approach. All Nut-trees, as namely, Walnut trees, Pine-trees, Filberds, Hazels, and Chestnut-trees, would be planted from between the first day of March, and the 15 thereof. To conclude, the only time for willowes and broom, is about the Calends or beginning of the same March. But of these two last named, the Broom loueth to be set of Nource-plants, comming of seed, in dry and light grounds: but contrariwise, the willow to be set of twigs in moist places, according as we haue before said.

CHAP. XIX.

¶ What trees they be that loue to sort and keepe companie together. The skill, and feat of baring the roots of trees, and also of hilling or banking them about.

There is besides a new manner of grafting trees, which I will not ouerpasse: for my purpose is not willingly to omit ought, that I haue found in any booke as touching this argument. And *Columella*, as him selfe affirmeth, was the first deuiser thereof, namely, to conioin trees of diuers natures, and such as otherwise cannot abide societie and fellowship together, as for example, Fig-trees and Oliue trees. He, I say, would haue a Fig-tree to be planted nere vnto an Oliue, and so nere indeed, as that a bough or branch of the oliue may reach vnto the Fig-tree at ease, considering that it is very supple and pliable otherwise, and ready to follow and be led as a man would haue it: and yet as obedient as it is, hee would haue it it euer and anon to be handled and made gentle in the meane time, that by this meanes inured first, it may bee bent and bowed to the purpose when the time serues. Which done, after that the Figge tree hath gotten some strength, and is growne to sufficient bignesse for to beare a graffe (which ordinarily is at three yeares end, or at the utmost when it is five yeares old) the head thereof must be cut or sawed off, and then the branch or bough of the Oliue before said, being well clenfed and made neat, and the head end thereof (as is before said) thwited and scraped sharpe, howbeit, not yet cut from the mother stocke, must bee set fast in the shanke of the Figge-tree, where it must bee kept well and surely tied with bands, for feare, that thus beeing forced and grafed arch-wise, it start and flurr not out againe, and returne vnto the owne. Thus beeing of a mixt and meane nature, betwene a branch or bough growing still vnto the Tree, and yet laid in the ground to take new root, and an Impe or Sion grafed, for the space of three yeares it is suffered to feed and grow indifferently betwene two mothers, or rather by the meanes thereof, two mother-

stockes

stocks are growne and vnited together. But in the fourth yeare it is cut wholly from the owne G mother, and is become altogether an adopted child to the Fig-tree, wherein it is incorporat. A pretty deuise, I assure you, to make a Fig-tree beare Oliues, the secret whereof is not knowne to every man: but I my selfe do conceiue and see the reason of it well enough.

Moreouer, the same regard and consideration about rehearsed; as touching the nature of grounds, whether they be hot, cold, moist, or dry, hath shewed vs also the manner of digging furrows and ditches. For in watery places it will not be good to make them either deep or large: whereas contrariwise, in a hot and dry soil they would be of great capacity, both to receiue and also to hold store of water. And verily, this is a good point of husbandry for to preserve not only young plants, but old trees also: for in hot countries, men vse in Summer time to raise hillocks and banks about their roots, and couer them all therewith; for feare lest the extreme heat of the Sun should scorch and burne them. But in other parts the manner is to dig away the earth, and to lay the roots bare, and let in the wind to blow vpon them. The same men also in winter doe H hake the roots about, and thereby preserve them from the frost. Contrariwise, others in the winter open the ground for to admit moisture, to quench their thirst. & But in what ground soeuer it be where such husbandry is requisite, the way of cleansing tree roots, and ridding the earth from them, is to dig a trench three foot round about. And yet this must not be don in meadows, forasmuch as for the loue of the Sun, and of moisture, the roots of trees run ebbe vnder the face of the earth. And thus much verily may suffice in generall, for the planting and grafting of all those trees that are to beare fruit.

CHAP. XX.

¶ Of Willow and Osier plots: of places where reeds and Canes are nourished: also of other trees that be vsually cut for poles, props, and stakes.

I remaineth now to speake of those trees which are planted and nourished for others, and for Vines especially: to which purpose, their wood is vsually lopped to serue the turne. Among which, Willows and Osiers are the chiefe, and to be placed in the forme rank: and ordinarily they loue to grow in moist and watery grounds. Now, for the better ordering of the Osier, the place would be well digged before, and laid soft two foot and a halfe deep, and then planted with little twigs or cuttings of a foot and a halfe in length, and those prickt in: or else stored with good big fets, which the fuller and rounder they be in hand, so much better they are for to grow, and sooner will they proue to be trees. Betwene the one and the other, there ought to be a space of six foot. When they are come to three yeares growth, the manner is to keepe them downe with cutting, that they stand not about ground more than two foot, to the end that they might spread the better in bredth, & when time serues be lopped & shred more easily, without the help of ladder: for the Within or Osier is of this nature, that the nearer it groweth to the ground, the better head it beareth. These trees also, as well as others, require (as men say) to haue the ground digged & laid light about them euery yere, in the month of April. And thus much for the planting and ordering of Osier willows, which must be employed in binding and winding. As for the other willow, which affordeth big boughs, for poles, perches, and props, those may be set likewise of twigs and cuttings, and trenched in the ground after the same manner. These lightly euery fourth yere will yeeld good poles or staues, & for that purpose would they then be ordinarily cut and lopped. If these trees become old, their boughs by propagation may still maintain and replenish the place; to wit, by couching them within the ground; & after they haue lien soone yere, and taken root, by cutting them clean from the stocke-farther. An Osier plat of one acre stored thus, will yeeld twigs sufficient for windings and bindings, to serue a vineyard of fise and twenty acres.

To the same purpose men are wont to plant the white poplar or Aspe, in manner following. First, a piece of ground, or a quarter, must be digged and made hollow two foot deep: and therein ought to be laid cuttings of a foot and a half in length, after they haue had two daies drying: but so, as they stand one from another, a foot and a handbreadth, & be couered ouer with mould two cubits thick.

As touching canes and reeds, they loue to grow in places more wet and waterish than either the Willows and Osiers abovesaid, or the Poplars. Men vse to plant their bulbous roots, which some

A some call their oillets or eies, in a trench of a span depth: and those two foot and an halfe asunder. These reeds do multiplye and increase of themselves (if a plot be once planted with them) after the old plants be extirped & destroyed. And surely, this is found now adaies to be the better and the more profitable way, euen to commit all to Nature, rather than to gield and weed them out where they seem to grow ouer thick, as the practise was in old time: for the manner of their roots is, to creepe one within another, and to be so interlaced continually, as if they were twisted together. The fit and proper time to plant and set these canes or reeds is a little before the calends of March, to wit, before the oillets or eies abovesaid begin to swell. They grow vntill mid-winter, at which time they wax hard, which is a signe that they haue done growing: and this is the only season also for to cut them. Likewise, the ground would be digged about them, as often as vines. The order of planting them is two manner of waies, for either the roots be laid ouerthwart or across, and but shallow within the ground (and look how many eies there be in the root, so many plants will spring about the earth: or els they be pitched down-right, within a graue or trench of a foot depth, so as there be two eies or buds vnder the ground, & the third about, but close and meet with it: but this caueat is to be giuen, that the head thereof may bend forward toward the earth, for feare that it drinke in any dew, which might stand and settle vpon it. This also is obserued, that they be cut euer in the wane of the Moone: as also, before that they are imploied about Vineyards for to beare vp vines, they would haue a whole yeares drying, for such are more profitable than the greene.

The best staies to beare vp Vines, are made of the Chestnut-tree: for why? the wood is gentle and tractable, tough withall, and induring long: besides, it hath this property, that cut it when you list, it will spring againe more plentifully than any willowes. It loueth to grow in a gentle and sandy ground, but principally, if the same stand vpon a moist grauell or a hot earth full of little pebbles, and namely, where there is good store of such soft stones, as will soone crumble into grit: neither makes it any matter how much the place be shadowed, nor how cold and exposed to the Northern winds, for such it liketh well enough, yea, although it be the side or hanging of an hill, as bleake and cold as may be. But contrariwise, it may not abide the red French earth, the chalkie or marle ground, nor in one word, any that is battle or fruitfull. Set it is of a Nut, as we haue before said: but it commeth not vp, vnlesse there be fise in a heape piled together, and those of the fairest & biggest sort. Moreouer, the plot wherein you mean to haue Chestnuts grow, must be ouertly broken vp aloft, from between Nouember and Februarie: in which time the Nuts vse to be loose, and to fall of themselves from the tree, and spring vnderneath, finding the ground light and hollow vnder them. Betwixt each heape set in manner aforesaid, there ought to be a foot space euery way, and the trench wherein they be set, of a span depth: out of this plot, as out of a seminary and nource-garden, these young plants are to be translated into another, and then they must be set two foot asunder. Howbeit, they ought to be about two yeres old first, before they be removed and replanted. Moreouer, a man may increase Chestnut-trees by propagation; to wit, by couching and trenching the branches thereof, as they grow to the mother: and there is not another tree againe that sooner taketh that way, than it doth; for the root thereof being laid bare, the whole branch must bee interred along in the trench made for the purpose, leauing out the end only about ground. Thus shall you haue one tree spring from it, and another from the root. Howbeit, planted in this wise, it loueth not to be transplanted; it cannot lodge elsewhere, but dreadeth and hateth all change of soile: and therefore such plots of ground as do afford coppises of Chestnut-trees, are stored with plants comming of marrons or nut-kernels, rather than quicke-fets or plants set with the root. For the ordering and dressing of them, there is no other labour required, than the others before rehearsed; namely, for the two first yeares insuing to dig the ground loose about their roots, and to proue or cut away the superfluous twigs: for euer after they will shift well enough, & manure themselves, by reason that their owne shade will kill those superfluous water-shoots that spring out either from the root or the sides of the tree. A coppise of these trees is cut ordinarily within euery seuenth yere: and one acre of them will yeeld props enough for to serue a vineyard of twenty acres: for besides that one pole of them will abide to be clouen and make two props apeece, they will last very well vntill the next fall of the wood or coppis be past.

Moreouer, the Mast-tree called Esculus, is planted and commeth vp in like sort: howbeit, passing vntoward and vnwilling they are to grow, and therefore they stand ten yeres at least before they

they be cut and lopped. Set Acorns of this tree Esculus wherfoeuer you please, they wil surely take and come vp: but the trench must be a span deep, and the Acornes two foot asunder. And foure times a yeare are they to be lightly raked and clenfed from weeds. A forke or prop made of this wood, lasteth very well and rotteth not: and in very truth, the more that the tree it selfe is cut and mangled, the better it springeth and putteth forth new shoots.

Ouer and besides these trees abouenamed, there be others that vse to be cut and lopped for Vine props and staies; to wit, the Ash, the Bay tree, the Peach and Hazell tree, yea, and the Apple tree: but these are all of them lateward and slow of growth: neither will they indure so well without rotting, if they stand any time in the ground, and much lesse will they abide any wet. But on the othe side, the Elder tree of all others is most firme for to make poles and stakes of. It wil grow of sions and imps euen as the Poplar. As for the Cypresse tree, we haue of it spoken sufficiently already.

CHAP. XXI.

The manner and skill of husbanding and dressing Vineyards.

Now that we haue treated sufficiently of the instruments, furniture, and tackling as it were belonging to Vineyards, it remaineth to speake of the nature of vines, and to deliuer with especiall regard the manuring and dressing them. According therefore as wee may see in Vines and some other trees, which haue within them a spongy matter and light substance, their twigs and branches do containe a kind of marrow or pith inclosed between certain knots or ioints wherewith their stalkes are diuided and parted. As for the fistulous concavities, they are but short all of them, and toward the top shorter and shorter, but euermore betwene two knots, they inclose the ioints aforesaid. Now this marrow, this vegetatiue and vitall substance, I say (call it whether you wil) runneth forward still on end al the length of the hollow kex or pipe so long as it findeth no resistance by the way: but meeting once with a ioint or hard knot which maketh head vpon it, not suffering the same to passe forward, it beeing driuen backe, returneth downward: howbeit, in that reuerberation, breaketh out vnder those knots, and putteth forth certaine wings or pinnions like arme pits, whereas the buds or leaues doe come; but alwaies in alternatiue course, one of this side, another of that; after the maner of reeds, canes, and fennell-greene, as hath bin shewed before; in such wise, that if one wing rise forth at the bottome of the lower knot on the right hand, another springeth for it on the left hand in that next above it; and thus they keep order the whole length of the branch. These sprouts when they are come once to some bignesse, and do branch there, be called of the Latines by a pretty name, Gemmae, as it were precious stones: but so long as they are no other than buds sprouting forth vnder the concavity or pit-hole of the foresaid ioints, they term them Oculos [i. Oilets or Eies:] marie in the very top they be named by them Germina [i. Sprigs or Burgeons.] After this order are ingendered the maine branches, the smaller sprigs yearly cut away, the grapes, leaues, and yong tendrils of Vines. But hereat I wonder most, that the burgeons comming forth on the right side, be alwaies more tough and firm than those of the left. To come now vnto the planting of these vines: the shoots or branches must be cut iust in the midst between the foresaid knots or ioints, so as the marrow in no wise run out. And if you would plant fig-sets or sions, they ought verily to be a span long, and then to be prickt into the ground (but first there should bee a hole made with a little stake) with the greater end that grew next to the body of the tree downward: provided alwaies, that two oilets or buds stand above ground. Now these oilets are properly (in twigs or sets of trees) those buds called, where the new spring first shooteth forth. And herupon it is, that these sions or cuttings being set in nource-gardens, beare the same yere that very fruit which they would haue borne vpon the tree, if they had not been cut off: and namely, if they be set in the right season whiles they be plump and full: for hauing conceiued on the Tree, they do consummat the sad conception so begun, and are deliuered thereof elsewhere. And look what Fig-sets be in this manner planted, may be easily and without danger removed and translated the third yere after. For certes, as this tree of all others soon ageth and indureth not long; so in recompence of short life, this one gift it hath of Nature; That it comes forward apace, quickly groweth to the full bignesse, and beareth fruit.

As for the Vine, there is not a tree that is planted more sundrie waies, nor affoordeth greater store

A store of sions or sets than it. For first and formost, nothing thereof is planted, but that which is vnprofitable, hurtfull, superfluous, and of necessitie to be pruned and cut away. But in the pruning, this rule must be obserued, that those branches bee cut off which were portoirs, and bare grapes the yere before. The manner in old time was to plant or set a sion, headed (as it were) and taking hold on both sides of the old wood and hard stock: whereupon, because it was fashioned like a little mallet or hammer head, it was and is at this day called in Latine Malleolus. But afterwards they began to slip off a twig with a heele only of the old wood (as they vse to doe in a Fig-tree:) & there is not a better way to make a Vine surely to take and liue than this. A third sort there is besides of sions or sets which are more readily gotten, without any such heele of the hard wood, and therefore they be wreathed and twined when they be set into the ground: B whereupon they be called in Latine Sagittae [i. Shafts:] for the same sions only cut off and not wreathed, are named Trigenimes, as a man would say, twigs with 3 buds or spurts: & therefore of one and the same vine-branch, a man may in this sort make many kinds of sions or sets. Howbeit, that is to be noted, that if you set any yong sprigs that neuer bare fruit but leaue onely, the Vines comming thereof will be euer barren: and therefore none ought to be planted but such as are fruitfull. A vine-set or cutting, that hath ioints standing thin, but here & there, is thought to be fruitlesse: but contrariwise, if it be set thick with buds, by all likelihood it will beare plentifully. Some are of opinion, that no sions should be put into the ground, but those that haue floured already: also, that to set such cuttings as be called shafts, which haue no part of the old wood, is not so fit; for, that in remouing they are in danger to break whereas they were writen. C Now, when you haue gotten such sets as be meet for planting, let them be a foot long at the least, and carry five or six knots, and at this length they cannot possibly haue fewer than three buds. Moreover, the best way is presently to set them the very same day that they be gathered. But in case a man be driuen to keep them long before they be put into the ground, great heed would be taken, according to the rule before said, that they be not laid about ground; that they dry not in the Sun; that they take no wind; nor loose their fresh vigor by cold. And if it chance that they lie out any while in the dry aire, they would be laied to soke in water many daies together, vntill they be refreshed and look green again, before they be set into the earth. The plot or quarter within the nource-garden or vineyard, ought to be well exposed to the Sun, of a good largeness, and sufficiently moulded: also, it must be well digged for 3 foot broad with a grubbing double toothed forke: then must you goe deeper and cast vp the earth with a broad spade or shouell, after that the same hath bin broken vp with a mattocke or yron tooke, carying foure foot in the head, so as the ditch may go two foot directly deep into the ground. Which done, the ditch is to be clenfed, & the mould to be spread abroad, & not left lying raw in that maner, but to take a kind concoction in the weather. And herein must the labourer proceed and be ruled by measure, and trie his worke thereby: for if the earth be not well delued, it will be soone found out by the vneuen balks or beds. There would be a iust measure taken also of the allies that lie between the beds. All things being thus prepared, let vs come now to the planting of the sets aforesaid, which would be couched either in trenches made of purpose, or in long furrows; and then the finest and most delicate mould that can be found, is to be cast aloft. But all this preuaileth not in a leane and hungry ground, vnlesse fatter earth be laied as a pallet vnderneath. Moreover, this is to be looked vnto, that two sets at the least be moulded and laied within the earth together in one range: also they must be so couched, that they leane with their heads close vpon the earth next about them; yea, and with one and the same stake the said earth ought to be driuen close and fast about them. Ouer and besides, throughout the whole plot or quarter of this nource-garden, regard is to be had, that between euery two sets there be a foot & an half one way; to wit, in breadth; and halfe a foot another way, to wit, forward in length. These plants being thus ordered, after they haue growne to twelue moneths, they should be then discharged of all their burgeons, euen to the nethermost knot, vnlesse haply it bee spared and let alone: for some there be that cut it also after these, commeth forth the matter of the oilets, & shew themselves; and therewith at the third twelue month end the quick-set root and all is removed to another place in the vineyard.

Besides all this, there is another pretty and wanton deuise, more curious ywis than needfull, to plant Vines, and namely, after this manner. Take foure branches of foure vines growing together, and bearing sundry kinds of grapes; bind them wel and strongly together in that part where

where they are most ranke and best nourished: being thus bound fast together, let them passe along either through the concauitie of an Oxe shanke and maribone, or els an earthen pipe or tunnell made for the nonce. Thus couch them in the ground, and couer them with earth, so as two ioints or buds be seen without. By this meanes they inioy the benefit of moisture, and take root together: and although they be cut from their owne stocke, yet they put out leaues & branches. After this, the pipe or bone aforesaid is broken, that the root may haue libertie both to spread and also to gather more strength. And will you see the experience of a pretty secret? you shall haue this one plant thus vnited of foure, to beare diuers and sundry grapes, according to the bodies or stocks from whence they came. Yet is there one fine cast more to plant a Vine, found out but of late, and this is the manner thereof: take a Vine-set or cutting, slit it along through the midst, and scrape out the marrow or pith very cleane; then set them together again wood to wood, as they were before, and bind them fast: but take heed in any case that the buds or oilets without-forth be not hurt, nor rased at all. This done, put the same cutting into the ground, interre it I say wel within earth and dung tempered together: when it begins to spread yong branches, cut them off; and oftentimes remember to dig about it, & lay the earth light: & certes, *Columella* holdeth it for certain, and assureth vs vpon his word, That the grapes comming of such a vine wil haue no stones or kernels at all within them. A strange thing and passing wonderfull, that the very set it selfe should liue; and that which more is, grow and beare, notwithstanding the pith or marrow is taken quite away.

Furthermore, since we are entred thus far into this discourse and argument, I cannot passe by but I must needs speake of such twigs and branches of trees as wil knit and grow together euen to a tree. For, certain it is, that if you take fise or six of the smallest sprigs of box, binde them together, and so prick them into the ground, they will proue and grow to one entire tree. Howbeit, in old time men obserued, that these twigs should be broken off from a Box tree, which neuer had bin cut or disbranched, for otherwise it was thought verily they would neuer liue: but afterwards this was checked by experience, and the contrary knowne. Thus much as touching the order of Vine-plants, and their nource-garden for store.

It remaineth now to speake of the manner of Vineyards and Vines themselves. Where in the first place, there offer vnto vs fise sorts thereof. For some traine and run along vpon the ground spreading euery way with their branches: others grow vpriight and beare vp themselves without any staies. Some rest vpon props, without any traile or frame at all: others be born vp with forks and one single raile lying ouer in a long range: and last of all, there be vines that run vpon trailes and frames laid ouer crosse-wise with foure courses of railes, in manner of a crosse dormant. The same manner of husbandry that serues those Vines which beare vpon props without any other frame at all, will agree well enough to that which standeth of it selfe without any staies. For surely it groweth so, for default onely and want of perches and props. As for the vine that is led vpon a single range as it were in one direct line, which they call *Canterius*, it is thought better than the other, for plenty of liquor: for besides that it shadoweth not it selfe, it hath the furtherance and help of the Sun-shine continually to ripen the grapes: it hath the benefit also of the wind blowing through it, by which means the dew will not long stand vpon it. Moreover, it lieth more handy to the hand for the leaues to be plucked away, and for the clods to be broken vnder it: & in one word, is readiest for all kind of good husbandry to be done about it. But about all other commodities it hath this, that it is not long in the floure, but bloometh most kindly. As for the frame aforesaid, that is ranged in one line a length, it is made of perches or poles, reeds and canes, cords and ropes, or els lines of haire, as in Spaine and about Brindis. The other kind of frame with railes and spars ouerthwart, beareth a vine more free, for plenty of wine than the rest, and called this is *Compluviana vitis*, because it resembleth the hollow course of gutter tiles, that in houses receiue all raine water and cast it off. For as the crosse dormant in building shutteth off the raine by foure gutters, euen so is this Vine led and caried foure waies, vpon as many trailes. Of this Vine and the maner of planting it, we will only speak, for that the same ordering will serue well enough in euery kind besides: marie there be far more waies to plant this than the rest, but these three especially. The first and the surest is, to set the Vine in a plot well and thoroughly delued: the next to it, is in the furrow: the last of all, in a trench or ditch. As for digging a plot and planting therein, ynough hath been written already.

¶ Of furrowes and trenches wherein vines are planted: also of pruning vines.

IT sufficeth that the furrow or trench wherein a vine is to be planted, be a spade or shouels bit breadth: but ditches would be three foot long euery way. Be it furrow, trench, or ditch, wherein a vine is to be replanted, it ought to be three foot deepe; and therefore no plant thereof should be remoued so little, but that it might ouer and besides stand about ground, and shew two buds at the least in sight. Needful it is moreover, that the earth be well loosened and made more tender and gentle, by small furrowes ranged and trenched in the bottom of the ditch; yea and be tempered sufficiently with dung. Now if the vineyard lie pendant vpon the hanging of the hill, it requireth deeper ditches, and those raised vp well with earth and bedded, from the brims and edges on the lower ground. As for such which shall be made longer, and able to receiue two vine-plants growing contrary one to the other, they shall be called in Latine, *Alvei*. Above al, the root of the vine ought to stand just in the midst of the hole or ditch; but the head and wood thereof which resteth vpon the sound and firme ground, as neere as possible is, must beare directly into the point of the *Aequinoctiall* Sun-rising: and withail, the first props that it leaneth vpon, would be of Reeds and Canes.

As touching the bounding and limitation of a vineyard, the * principall way which runneth streight East and West, ought to carry 18 foot in breadth, to the end that two carts may passe easily one by another, when they meet; the other crosse allies, diuiding euery acre just into the mids, must be ten foot broad: but if the plot or modell of the vineyard wil beare it, these * allies also which lie North and South, would be as large ful as the foresaid principal high way. Moreover, this would be alwaies considered, That vines bee planted by fises, (i. e.) that at euery fifth perch or pole that shoreth them vp, there be a path diuiding euery range and course, and one bed or quarter from another. If the ground be stiffe and hard, it must of necessitie bee twice digged ouer, and therein quick-fets only that haue taken root, must be replanted: marie in case it be a loose mould, light, and gentle, you may set very cuttings and sions from the stock, either in furrow or in trench, chuse you whether. But say it be a high ground and vpon the hill, better is it to cast it into furrowes ouerthwart, than to dig it; that by this meanes the perches or props may keep vp the ground better, which by occasion of raine water would settle downward. When the weather is disposed to raine, or the ground by nature drie, it is good planting vine-fets, or sions at the fall of the lease, vnlesse the constitution of the tract and qualitie of a country require the contrary: for a dry and hot soile would be planted in Autumne or the fall of the lease, whereas a moist and cold coast may tarry, euen vntill the end of Spring. Let the soile be dry and hard, bootlesse it will be to plant, yea though it were a very quick-set, root and all. Neither will it do well to venter the setting of imps cut from the tree, in a drie place, vnlesse it be immediately vpon a good ground shower: but in low grounds, where a man may haue water at will, there is no danger at all to set vine branches, euen with leaues on the head; for they will take well enough at any time before the Mid-summer Sun-stead, as we may see by experience in Spaine: When you will plant a vine chuse a faire day; and if possibly you can, let it be when there is no wind stirring abroad; for such a calme season is best: and yet many are of opinion, that Southern winds be good, and they wish for them, which is cleane contrarie vnto *Cato* his mind, who expressly excepteth and reiecteth them. If the ground be of a middle temperature, there ought to be a space of fise foot distance between euery vine: and in case it be a rich and fertile soile, there would bee foure foot at least from one to another; but in a leane hungrie piece of light ground, there should be eight foot at the most: for whereas the *Vmbrians* and *Marfians* leaue twenty foot void between euery range of vines, they doe it for to plough and sow in the place, and therein they haue quarters, beds and ridges, called *Porculera*. If the place where you plant a vineyard be subiect to thicke and darke mists, or to a rained disposition of the weather, vines ought to be set the thinner: but in a drie quarter, it is meet they should bee planted thicke. Moreover, the wit and industrie of man hath found out meanes to saue charges, and in setting a nource-garden with vine-fets to goe a nearer way, with small expence and no losse of ground: for in replanting a vineyard with quicke-fets vpon a leuell plot, onely digged and laied euen, they haue with one and the same labour (as it were by the way) replenished the ground be-

tween euery such rooted plants, with vine cuttings for store, so as the quicksets may grow in his owne place appointed, and the sion or cutting (which another day is to be transplanted) in the mean time take root between euery course and range of the said vine quick-sets, before they be ready to take vp much ground. Thus within the compasse of one acre, by iust proportion a man may haue about 16000 quick-sets. This is the difference only, that such beare not fruit so soon by two yeres: so much later are they that be set of sions, than those that were transplanted and remaine still on foot. When a quick-set of a vine is planted in a vineyard, and hath grown one yere, it is usually cut downe close to the earth, so as but one eie or button be left aboue ground, and one shote or stake must be stickt close to it for to rest vpon, and dung laid well about the root. In like manner ought it to be cut the second yere. By this means it gathereth strength inwardly, and maintaineth the same in such wise, as it may be sufficient another day to beare and sustain the burden both of branch and bunch, when it shall be charged with them: for other wise if it be let alone and suffered to make hast for to beare, it would prooue to be slender, vined, leane, and poore: for surely this is the nature of a vine, That she groweth most willingly: in such sort, that vnlesse she be kept vnder, chafised, and bridled in this manner (her inordinat appetite is such) she will run her selfe out of heart, and go all to branch and leafe.

As touching props and shotes to support vines, the best, (as we haue said) are those of the Oke or Oliue tree, for default whereof, ye may take good stakes and forks of Iuniper, Cypressse, Laburnum, and the Elder. As for those perches that be of other kinds, they ought to be cut and renewed euery yere. Howbeit, to lay ouer a frame for vines to run vpon; the best poles are of Reeds and Canes, for they will continue good fye yeres, being bound many of them together. When the shorter branches of a vine are twisted one within another in manner of cording or ropes, and strengthened with the wood of vine cuttings amongst, thereof arch-worke is made, which in Latine they call Funeta. Now by the time that a vine hath growne three yeres in the vineyard, it putteth forth apace strong branches, which in time may make vines themselves; these mount quickly vp to the frame: and then, some good husbands there be, who put out their eies, that is to say, with a cutting hook (turning the edge vpward) fetch vp the eies budding out beneath: thus by pruning, although they seem to do hurt and wrong vnto them, yet they draw them to shoot out the longer by the meanes: for in good faith, the more profitable way it is, thus to vse & acquaint it with bearing branches lustily, and far better and easier is it besides to cut away these yong imps as the vine lieth fast joined to the frame, vntill such time as a man think it be strong enough of the wood. Others there are, who in no case would haue a vine touched or medled with all, the next yere after that it is remooued into the vine-yard; nor yet to feele the edge of the cutting hooke, vntill it haue fye yeres ouer the head; many then they agree it should be pruned & galled of all the wood it hath, saue only three burgeons. You shall haue some againe that will indeed cut them the very next yere after they be replanted, but so as they may win euery yere three or foure ioints; and when they be foure yeres old and not before, they giue them liberty to climbe vpon the frame. But this (I assure you) is the next way to make the vine fructifise slowly and late: besides, it causeth it to seem scortched and full of knots, yea and to grow like a dwarfe or wreckling. The best simply, is to suffer the stocke or mother to bee strong first, and afterwards let the branches and yong imps hardly, be as forward and audacious as they will. Neither is it safe trusting to one which is full of cicatrices or skarres (a thing that proceeds of great error and an vnskillfull hand;) for surely all such branches grow of hurts or wounds, and spring not one jot from the mother stock indeed: for all the while that shee gathereth strength, her whole vertue remaineth within her; but when she is suffered to grow and fructifise, she goeth throughly to worke, and emploiet her forces full and whole to bring forth that, which yeerely shee conceiued: for Nature produceth nothing by halfes nor by peece-meale, but is deliuered of all at once. Well then, after that a vine is once full grown and strong enough, let it presently run vpon perches, or be led in a traile vpon a frame; but in case it bee yet with the weakest, let it be cut againe, and take vp her lodging hardly beneath vnder the very frame: for in this point the question is not, what Age, but what Strength it hath: for that is it which must rule all. And verily great folly and rashnesse it were, to put a vine to it, and let her haue the will to grow ranke, before she be as big full as a mans thumbe. The next yere after that it is gotten to the frame, there would be saued and let to grow one or two branches, according to the strength and ability of the mother: & let the same the yere following also be preferred, nourished,

- A nourished, and permitted to grow on end, vnlesse her feeblenesse be against it: but when the third yere is come, and not afore, be bold to giue her the head with two branches more, and neuer let her goe but with foure at the most. In one word, hold a vine downe as much as you can, neuer cocker and cherish her, but rather repress her fruitfulness; for of this nature is the vine. Rather than her life, she would be alwaies bearing; neither taketh she such pleasure to liue long, as to beare much: and therefore the more you take away of her ranke and superfluous wood, the better will she employ her radicall sap and moisture to fructifise and yeeld good store of grapes: yet by her good will she would be euer putting forth branches for new plants, rather than busie in bearing fruit: for well woth she, that fruit will fall and is but transitory. Thus to her owne vndoing and ouerthrow, while shee thinketh to spread and gaine more ground, shee spends her strength, her selfe and all. Howbeit, in this case, the nature of the soile will guide a man and aduise him well: in a lean and hungry ground, although the vine be strong enough, you ought to keep it downe with cutting, that it may make abode vnder the head of the traile and frame aboue, and howtoeuer the may haue some hope that her yong branches may get vp to the top, (as being at the very point to mount aboue it, and so neare as that they reach therevnto) yet let her stay there and proceed no farther: suffer her not (I say) to lay her head thereupon and couch vpon the traile, nor wantonly to spread and run on at her ease. In this manner (I say) hold her head in with the bridle, that she may in the end chuse rather to grow big in body & strong with all, than to shoot forth branches about her euery way far and neare. The same branch now that is kept short of the frame, ought to haue two or three buds to burgeon at, and to bring forth more wood in time: and then let it be drawne and trained close vnto the traile and tied fast thereto, that it might seeme to beare vpon it and be supported thereby, and not to hang loosely thereupon. Being thus bound to the frame, it must likewise be tied anon, three buds or joints off: for by this means also the wood is reclaimed and repressed from running out in length beyond all measure, and the burgeons in the way between will come thicker & shoot vp on height, to furnish the husbandman with store of new sets and sions for the next yere. The very top end in no wise must be tied. Certes this property and qualitie hath the vine, That what part soeuer of it is dejected and driuen downward, or els bound and tied fast, the same ordinarily beareth fruit, and principally in that very place where it is bowed and bent in manner of an arch. As for the other parts which be backward and neerer to the old maine stocke, they send out store of new branches indeed, full of wood, but otherwise fruitlesse that yere: by reason (I suppose verily) of the spirit or vegetatiue life, and that marrow or pith whereof wee speake before, which findeth many stops and lets in the way. Howbeit these new shoots thus putting forth, will yeeld fruit the next yere. Thus there offer vnto vs two kinds of vine branches: for that which springeth out of the hard and old wood, and promiseth for that yere following nothing but sprigs and twigs onely, is called Pampinarium: whereas that which commeth more forward beyond the cup or cicatrice, and beareth shew of grapes, is named Fructuarium. As for another, springing from a yere-old branch, it is left alwaies for a breeder and kept short vnder the frame: as also that which they terme Custos, [i. the Keeper, or Watch:] a yong branch this is, and no longer than it may well carry three buds: which the next yere is like to beare wood and repaire all, in case the old vine stocke should miscarry and spend it selfe by carrying too great a burden. Also another burgeon there is close to him, bearing out like a knob, of the bignesse of a wart (called heis Furunculus) who must serue the turne and make supply, if peraduenture the foresaid Watch or Keeper faile.

Moreover, a vine if it be suffered to beare before the seuenth yere after it was first set of a cutting or sion, decaith sensibly and soon dieth: neither is it thought good to let the old wood run on still in length vpon the frame, as far as to the fourth forke that vnderproppeth it, (such old crooked branches some call Dracones, others Iuniculos) to make thereof huge and great trailes of vines termed Malesculetæ. But worst of all it is, to seeme for to propagate or draw in a long traile within the ground vines in a vineyard, when they be growne hard with age. When the vine is fye yeres old, a man may boldly wind and twine the very branches, so as out of euery one there be a twig let to grow at liberty: thus he may proceed forward to the next, cutting away the wood as he goeth that bare before. The surer way euermore is supposed to leaue the Watch or Keeper behind; marie he must le next vnto the vines maine bodie, and nearest the root, and no longer than is before set downe. Now in case the branches prooue ouer ranke,

they must be writhed and twisted in maner aforesaid, so as the vine stock may put forth no more than foure boughs at the most, or twaine if so be it rest vpon one chanter or range of perches. If you would order a vine so as it may stand alone without any proppes, at the beginning it would desire and haue some supporter or other (it makes no matter what) to rest vpon, vntill it haue learned to stand of it selfe, & rise vpright: afterwards, it is to be vsed in manner of all other vines when this training is past. This regard would be had in pruning and cutting the twigs of these vines called Pollices, That a man well guide and ballance his hand, and go euen withall in euery part indifferently, for feare lest one side be charged with fruit or branch more than the other: whereby the way, he must also remember to keepe downe the head, and not suffer it in any wise to run vp in height: for if this kind of vine be about three foot high, it will hang the head downward. As for others, they may well grow to fise foot and vpward, so that they passe not in any case the full height of a man. To come now vnto the other vines that creepe along and spread ouer the ground; they be inuironed all the way as they run, with pretty short hollow cages as it were, to rest and repose their branches in. They haue need moreouer of certaine trenches or ditches round about to run in, to the end that as the said branches wander too and fro, they should not incounter one another and strue together. And verily in most parts of the world, they vse to gather their vintage of vines thus growing low by the ground: as we may see the manner is in Africke, Egypt, Syria, throughout all Asia, and in many places of Europe. For the good vse and dressing of these vines, a speciall care would be had to keepe them downe close to the earth; and to fortifie the root, so long and in the same manner, as hath been shewed before in those, that are shored or beare vpon frames; with this charge and regard besides, to leaue alwaies the short twigs only called Pollices, with three buds a piece, in case the ground be fruitfull, or * five, if it be light and lean. And in one word, better it is without all question, that they be left many, than long. As for those points which we haue deliuered heretofore, as touching the nature of the soile, they will be more effectually seen to proue either the goodnesse or the contrary, in the grapes of this vine, by how much nearer they lie to the ground than others. Wherein consideration is to be had of the sundry sorts of vines; namely, that they be seuered apart; and nothing is better, than to fort euery one with the tract or region that agreeth best with it, and therein to plant them accordingly: for these mixtures of diuers kindes are neuer good, but alwaies discordant: naught in old wines that come to our table, much worse then you may be sure, in those that be new and not yet tunned vp. But if a man will intermingle plants of sundry vines together, yet in any case those would be ioined together (and none els) which ripen their fruit at one and the same time.

For frames and trailes wherein vines are to run, the better and more battle that the ground of the vineyard is, the plainer and euener that it lieth, the higher they would be from the ground; likewise if the place be subiect to dews, fogs, and mists, and nothing exposed to the winds: contrariwise, if the ground be leane and dry, hot, and open to the winds, they must be the lower and nearer the earth. As concerning the rafters, that lie ouer & reach from prop to prop, they ought to be tied and fastened therewith as streight and sure a knot as is possible; whereas the Vine would be bound vnto them, but slacke. Of the sundry sorts of Vines, as also which were to be planted in this or that soile, and what coasts & climats each one of them loueth, we haue shewed sufficiently in the particular treatise of their nature, and of the wines that come of them.

Toucing all other points of husbandry that remaine behind; much doubt and diuers questions are made: for many there be that feare not all Summer long to bee digging in the vineyard about vine-roots, after euery little raine. Others again forbid to meddle & be lusty therein, in the budding time: for it cannot be auoided, but that the yong oylets will either bee smitten off clean, or els galled or bruised one time or other, with their gate that go in and out between: which is the cause, that they would haue all kind of cattell to bee kept out that they come not neare, and especially such as beare wooll on their backs; for sheep of all others soonest rub off the buds as they passe by, with their shag coats. Moreouer, they are of opinion, that all manner of raking and harrowing, is an enemy to vines when they bee in their floure, and putting forth young grapes: and sufficient it is (say they) if a vineyard be delued thrice in one yere; to wit, first from the spring Equinox, to the apparition of the Brood-hen star; secondly, at the rising of the great Dog star; and thirdly, when the grape beginneth to change colour and turne blacke. Others set out these times after this maner: if the vineyard be old, they would haue it once digged

A ged betweene vintage and mid-winter; howsoeuer some be of this mind, That it sufficeth them to bare the roots only of the vines and lay dung thereto. The second deluing they would haue to be from the Ides of Aprill, and six daies before the Ides of May, that is, before they begin to conceiue and bud: and thirdly, before they fall to blossom; also when they haue done flourishing; and also at the time when the grapes alter their hew. But the more skilfull and expert husbands affirme constantly, That if the ground be ouermuch laboured, and digged too often, the grapes will be so tender skinned, that they will burst againe. Moreouer, these rules following are to bee obserued, That when any vines do require such deluing and digging, the laborers ought to goe to worke betimes before the heat of the day: mary if the vineyard stand vpon a mirie clay, it is not good then either to eare or dig it, but rather to wait for the hot season; for the dust that riseth by digging, is very good (by their saying) both to preserue the vine and grapes from the parching Sun, and also to defend them against the dropping mists.

As for disburgening of vines, and cleming them of their superfluous leaues, all men accord; that it should be done once in the Spring, to wit, after the Ides of May, for the space of eleuen daies following; and in any hand before they begin to put forth floure. And how much thereof must be thus dooiled for the first time: euery all that is vnder the traile or frame, & no more. As for the second, men be not all of one minde; some would haue the leaues to be disbranched when the vine hath done flourishing: others expect, vntill the grapes begin to be ripe. But as touching these points, the rules that Cato giueth, will resolute vs: for we are now also to shew the manner of cutting and pruning vines. Many men begin this worke immediatly after vintage, when the weather is warm and temperat: but indeed (by course of Nature) this should neuer be done before the rising of the Aegle star (as we will more at large declare in the next booke, where we are to treat of the rising and fall of the fixed stars and of their influences) or rather in truth, when the Westerne wind Faunonius beginneth to blow, forasmuch as there might be danger in going ouer soon to work, considering that haile commonly maketh wast. For this is certain, that if there come an after-winter, and chance to bite the vines newly medicined (as it were) or rather fore with this pruning, if it happen (I say) that when euery man makes reckoning that winter is gon, it come vpon them againe and whiske with his taile, their buds pinched with cold will lose their vigor, their wounds will cleaue and make rifts, in such sort, that when the humidity is distilled and dropped forth, the oylets will be nipt and burnt away with the bitternesse of the vntimely weather; for who knoweth not, that in frost it is ticklish meddling with vines, and that they be in danger soon to breake and knap asunder? To say therefore a truth, by order of Nature there would not be such haile made. But here is the matter, they that haue a large domaine and much lands to look vnto, they that must go through a great deale of work, cannot wil nor chuse but begin betimes, and make this computation and reckoning aforesaid. And in one word, the sooner that vines be pruned (if the time wil serue commodiously) the more they run into wood and leaues; and contrariwise, the later you go to work, the more plenty of grapes they wil yeeld: and therefore it is meet and expedient to prune vines that be poore and feeble, very timely; but such as be strong and hardy, last of all.

As for the manner and fashion of the cut, it ought alwaies to be aslant, like a goats foot, that no drops of raine may settle and rest thereupon, but that euery shower may soon shoot off: also that it turn downward to the ground, that it be euen and smooth made with a keen and sharpe edged bill or cutting hook. Furthermore this heed would be taken, that the cut be iust between two buds, for feare of wounding any of the oylets neere vnto that part which is cut off: and commonly this is supposed to be blacke and dusky, and so long as it is so seen, it ought to be cut and cut again, vntill you come to that which is found and cleare indeed: for neuer shall yee haue out of a faulty and corrupt wood any thing come forth that will bee worth ought. If the vine be so poore and lean that it affordeth no branches meet and sufficient to beare, cut it down to the verie ground, for best it is then to fetch new from the root, and to see whether they will be more liuely. Over and beside in disburgening and dooiling a vine, you must beware how you pluck off those burgeons that are like to beare the grape, or to go with it; for that were the next way to supplant (as it were) the grapes, yea and kill the vine, vntil it were a new and yong plant. Will you then know which are vnprofitable and may be spared? euery all those are deemed superfluous, which are come not directly from the knot or neere oylet, but grow out of the side: and no marvell, since that the verie branches of grapes which hang in this manner out of

the hard wood, are so stiffe and tough also, that vnneth a man may plucke them off with his fingers, but had need of a knife or hook to cut them away. **G**

As for the pitching of props into the ground, some are of opinion that the best way is to set them between two vines: and indeed that were the easier way to come about the vines, for to lay their roots bare when time serueth. Also, better it is far so to doe, in a vineyard where the vines run vpon one single traile, in case the said traile be strong enough, and the vineyard not subiect to the danger of winds: but where a vine runneth foure waies, it must be relieued with prop and stayes as neer as may be, to support the burden; yet so, as they be no hinderance when as men should come about the foot to lay the root bare: and therefore they would be a cubit off, and no more. Moreover, this is a general rule, that a vine be clenfed about the root beneath, before that it be pruned aboue.

Cato treating generally of all maters concerning vines, writeth thus by way of rule and precept; Let your vine (quoth he) be as high as possibly you can: fasten it to the frame decently, but take heed you bind it not too hard. Dresse and order it after this manner: After you haue cut away the tips and tops therof, dig round about the roots, and be: in then to eare vp & plow the vineyard: draw furrowes and ridges too and fro throughout. Whiles vines be yong & tender, couch the branches within the ground for propagation, with al speed: as for old vines, geld them as little as you can, & keep them with a good head; rather if need require, lay them along on the ground, and two yeares after cut them hard to the root. If it be a yong vine, attend vntill it be of strength sufficient, then will it be time and not afore to prune it. If haply the vineyard be bare and naked of vines, and that they grow but thin here and there, make furrowes and trenches between, and therein plant new quickets: but rid the weeds well from about those Trenches, for ouershadowing them: be euer also digging and delving. Then, if it be an old vineyard, so drage and pulse for prouender: if it be a lean and light ground, sow nothing that bears grain or corn. Be sure that ye lay about the heads of the said quickets, dung, chaffe, refuse of grapes pressed, and such like mullock. When the vine beginneth to put out leaues and look green, fall to disburgeoning. So long as the Vines be yong and tender, tie them surely in many places, for feare lest the wood or stalk therof do break asunder. But when a vine hath gotten head to perch aloft vpon a single traile, gently binde the tender burgeons and branches thereof, extend and stretch them out, and lay them streit. Now when they stand once vpright and are able to beare themselves, mark when the grapes begin to change colour, bind them wel and sure below. **K**

As for grafting of vines, there are two seasons of the yeare meet therefore: the one in the spring, the other when the vine doth floure, and this is held for the best. If you purpose to translate an old stock of a vine into another place, and there to replant it, cut off the first thick arm only, leauing behind two buds and no more. In taking of it vp, be carefull that you do it with such dexterity, as that you race not nor wound the root. This done, look how it grew before, so set it now, either in trench or furrow: couch it wel and close, and couer it thoroughly with good mould. After the same manner as is before said vnder set and prop it vp, bind it, turn and winde it; but aboue all be euery while digging about it. As touching the drage called Ocymum, the which **Cato** wills to be sowed in a vineyard, it is a kind of forage or prouender for horses, which the Latines in old time named Pabulum; it cometh vp very speedily and groweth fast, and besides can well away with shadowie places. **L**

CHAP. XXIII.

¶ Of Trees ranged in reues for to support Vines.

IT remaineth now in this discourse and treatise of Vines, to write of the manner of trees planted of purpose for to serue their turn. And here I cannot chuse but cal to mind, first, how this point of husbandry hath bin iudged naught, and altogether condemned by the two *Sarsenae*, both father and sonne; but contrariwise held for good, and highly commended by *Serapion*: whereas all three were reputed the most antient writers, and skilfullest in this kind next to **Cato**. **M** And yet *Serapion*, as great a patron as he is thereof, alloweth not this deuice in any clymate else but only in Italy. Howbeit, gon this hath for currant many yeares past, and time out of mind, That the best and most dainty Wines came of those grapes onely which grew vpon such Hauins or trees before said. Yea, and it was thought generally, that the higher a Vine climbed vpon

A on these trees, the better grapes it bare, and yeelded more commendable wine: and againe, the lower that those trees were, the greater plenty followed both of the one & the other. By which a man may see how materiall it is to raise Vines on high, and haue grapes growing in the top of trees. In which regard, choise also is to bee made of trees for this purpose. And here first and formost is presented vnto vs the Elme: and yet I must except that kind of it which is called *Antinia*, by reason that it is ouermuch charged with boughes and leaues, and therewith too full of shade. Next vnto it may be ranged the blacke Poplar, euen for the same cause, because it is not leaved nor branched so thick. Many men there be that refuse not the Ash, the Fig tree, yea and the Oliue, so that it stand not ouer thicke with boughs, and make too much shade. As for the setting, planting, and ordering of these trees in general, we haue sufficiently and to the full treated heretofore. But now for this speciall and peculiar vse that they be put vnto, this would bee considered, That Vines which are to be wedded to these trees, must in no wise feeble the edge of the cutting hooke, before they be three yeares old full. After which time, this regard ought to be had, that euery second branch or arme thereof is to be spared, and likewise each other yeare and no oftener they are in this wise to bee pruned: and by that they are six yeres old, it is good time to joine them in marriage vnto their husbands afore said.

In Piemont, Lombardie, and those parts of Italy beyond the riuier Po, they vse for this purpose to plant their grounds with these trees ouer and besides those afore named, to wit, the Cornell, the Opier or Wich-hazell, the Teil or Linden, the wild Ash Ornus, the Carpin Carme or Horn-beanie, and the Oke. About Venice and all that tract, the Willowes serue the turne and none else, by reason that the whole shadeneth so much vpon water. **C**

As touching the Elme, named in the first place, it must be kept plaine and bare, and the great water-boughs vnderneath shread vntill you come to the middest of the tree, or thereabout, and then the rest ought to bee arraunged and digested into good order, whereupon the Vine may climb as it were vpon staires or ladder rounds: and lightly none of these trees vpward be aboue twentie foot high. Now in case it be a high ground vpon an hil, and drie, they are permitted to branch and shut out their armes, within eight foot of the ground. But in plaines and low moist grounds, they begin not to fork before they beare twelue foot. Howbeit, let the place be what it wil, the flat of the tree from whence the boughs begin to diuide, ought to regard the south sun. And the said branches immediately from their project must rise somewhat vpright in maner of fingers, standing forth from the palm of ones hand, among which, the smal sprigs must estsoons be barbed (as it were) & shauen clean off, for feare they do not ouershadow the Vine branches. **D**

As touching the space or distance between one tree & another, the ordinarie proportion is, that affront and behind, in case the ground be erable, it beare fortie foot: but a flank, or on the side, twentie. Marie, if it be not well tilled and husbanded, so much wil serue euery way, to wit, twentie foot and no more. Commonly euery one of these trees maintaineth tenne Vines at the foot therof: and a bad husband he is who hath fewer reared about it than three. But by the way, it is no good husbandrie to suffer a tree thus to be coupled (as it were) in marriage to so many Vines, before that it be of sufficient strength to entertain them: for there is nothing so hurtfull, by reason that the Vines will choke and kill them; so quick they be of their growth, and so ready to ouercharge them. **E**

As for planting of Vine-sets to the root of trees, needful it is to make therefore a ditch three foot deep: and they ought to be distant one from another a ful foot, and so much likewise from the tree. This don, there is no question thereof the smal twigs or shoots what to do with them: neither is there any charge or expence required for digging and deluing: for this is the manner of it, and this peculiar gift haue these tree-rows, That in the same ground where they grow, the sowing of come is nothing hurtfull, nay, it is profitable and good for the Vines. Moreover, this commoditie and easement cometh of their height, that they be able to saue themselves: neither is there any such need, as in other Vineyards, to be at the coast of walls, of mounds, pales, or hedges, ne yet of deep ditches or other fences, to keep off the violence or injuries of beasts. Of all other toiles before rehearsed, there is no more required but to looke vnto onely the getting of quick-sets, or couching sions: all the matter I say lieth herein, and there is no more to do. **F**

But of couching sions and that kind of propagation, there be two deuises. First within paniers or baskets vpon the boughs of the tree, and that is the best way, because it is safest from the danger of cattel. The second is, to bend the Vine, or a branch therof, close to the foot of her

owne tree, or else about the next vnto it: if it stand single and haue no Vine joined vnto it. As much of this branch or Vine thus couched as is about the ground, must be kept with scraping, that is to say, the buds ought euer and anone to be knapt off, that it spring not forth. Within the earth there should be no fewer than foure joints or budding knots buried and entered for to take root; in the head without, two onely are left for to grow. [Where, note by the way, that the Vine which groweth to the foot of a tree, must be trenched in a ditch foure foot long in al, three in breadth, two and an halfe in deapth.] Now, when the sion thus couched, hath lien one yere, the order is to cut it toward the stock to the very pith or marrow, that so by litle and litle it may be inured to fortifie it selfe vpon the own roots, and not to hang and cling alwaies to the mother: as for the other end or head thereof, it would be cut off also so neere the ground, as that there be but two onely buds left. By the third yere it must be quite cut in two, (where before it was but guelled to the pith) and that which remaines of it, laid deeper into the ground, for feare it should sprout forth and beare leaues toward that side where it was cut in twaine. This done, no sooner is Vintage past, but this new quicke-set, root and al, must be taken vp and replanted.

Of late daies deuised was the manner of couching or planting by a trees side a Vine Dragon (for so we vse to call the old branch of a Vine past all seruice, which hath done bearing many a yere, and is now grown to be hard.) And verily, they vse to make choise of the biggest they can find, which when they haue cut from the stocke, they scrape and pil the bark, three foure parts in length, so farre forth as it is to lie within the ground [wherupon they name it in Latine Rafilis:] when it is thus couched low within a furrow, the rest that is about the earth they rear vp against the tree. And it is thought, that there is not so good nor so ready a mean to make a Vine grow and beare than this. If it fall out so, that either the Vine be smal and weak, or the ground it selfe but lean and hungrie, it is an vsuall and ordinarie practise to cut and prune it as neer the ground as possibly may bee, vntill such time as it bee well strengthened in the root, as also, great regard is had, that it be not planted when the deaw standeth vpon it, ne yet when the wind sits full in the North. The old Vine stock it selfe sought to look into the Northeast, prouided alwaies that the yong branches turne Southward. Moreouer, new and tender Vines would not be prouided and cut in half: but better it is to expect and tary vntill such time as they be strong ynough and able to beare the cutting bill: meane while, to gather the yong branches together round in manner of an houp or circle. [Where note by the way, That Vines which are erected vpon trees for the most part beare later by one yere than those in Vineyards that be peached or run on frames.] Somewould not haue them to be cut at all, before they haue raught vp to the top of the tree. At the first time when you come with the pruning hooke, the head must be cut off at six foot from the ground, leauing vnderneath one little top twig, which must be forced to beare by bending it downward in the head: and in the same, when it is thus pruned, there must be left behind three buds and no more. The branches which burgen out from thence, ought the next yere to bee brought vp to the lowest armes of the tree, and there seated: and so from yere to yere, let them climb vp higher to the vpper boughs, leauing alwaies vpon euery loft or scaffold as it were where they rested, one branch of the old hard wood, and another yong imp or twig, for to grow vp and climbe as high as it will. Furthermore, as often as a Vine is pruned afterwards, those branches or boughs thereof in any wise must bee cut away which were bearers the yere before: and in stead of them, the new after they be first cleansed from all the hairy & curled tendrils on euery side shred off. The ordinarie manner of pruning and dressing of vines here about Rome, is to let the tender branches and sprigs enterlace the boughes, inso much, as the whole tree is ouerspread & clad therewith, like as the very same tendrils be also couered all ouer with grapes. But the French fashion is to draw them in a traile along from bough to bough: whereas in Lumbardie and along the caufey Emilia [from Plaifance to Rimino] they vse to train them vpon forkes and poles: for albeit the Atinian Elmes be planted round about, yet the Vine commeth not neere their Greene boughes. Some there be, who for want of sill and good knowledge about vines, hang them by a strong bond vnder the boughs: but this is to wrong, yea to stifte and strangle them outright: whereas indeed a vine, as it ought to be kept down with oisier twigs, so it must not bee tied ouer streight. For which cause, euen they also who otherwise haue store & plenty ynough euen to spare, of willows & oisiers, yet chuse rather to bind vines with some more soft and gentle matter, to wit, with a certain hearb, which the Sicilians in their language

A language called Ampelodesmos [i. Vine-bind.] But throughout all Greece they tie their vines with Rushes, Cyperus, or Gladon, Reeke, and sea-grasse.ouer and besides, the maner is otherwise to vntie the Vine, and for certain daies together to giue it liberty for to wander loosely, and to spred it selfe out of order, yea, and to lie at ease along the ground, which all the yere besides it onely beheld from on high: in which repose it seemeth to take no small contentment and refreshing: for like as draught horses, when they be out of their geeres, and harkies vnadled, like as Oxen when they haue drawn in the yoke, yea, and greyhounds after they haue run in chase, loue to tumble themselves and wallow vpon the earth: euen so the Vine also, hauing bin long tied vp and restrained, liketh wel now to stretch out her lims and loins, and such easement and relaxation doth her much good. Nay, the tree it selfe findes some comfort and ioy therby, in being discharged of that burden which it carried continually as it were vpon the shoulders, and seemeth now to take breath and heart again. And certes, go through the whole course and worke of Nature, there is nothing, but by imitation of day and night, desireth to haue some alternatiue ease and play dayes between. And it is by experience found very hurtfull, and therefore not allowed of, to prune and cut Vines presently vpon the Vintage and grape-gathering, whiles they be still wearie and ouertrauelled with bearing their fruit so lately: ne yet to binde them, thus pruned, in the same place again where they were tied before: for surely vines do feel the very prints and marks which the bonds made, and no doubt are vexed and put to pain therewith, and the worse for them.

The maner of the Gaulles in Lumbardy, in training of Vines from tree to tree, is to take two boughs or branches of both sides, and draw them ouer, in case the stock Vines that beare them be forty foot asunder: but foure, if they are but twenty foot distant. And these meet one with another in the space between, and are interlaced, twisted and tied together. But where they are somewhat weake and feeble, they be strengthened with Oisier twigs or such like rods here and there by the way, vntill they beare out stiffe: and look where they be so short that they wil not reach out, they are with an hook stretched and brought to the next tree that standeth without a Vine coupled thereto.

A Vine branch drawn thus along in a traile, they were wont to cut when it had growne two yeaes: for in such Vine stocks as by reason of age are charged with wood, it is the better way to giue time & leifure for to grow and fortifie the said branch that is to passe from tree to tree, so as the thicknes thereof will giue leaue: yea and otherwise it is good for the old main bough to feed still and thrive in pulp and carnositie, if we purpose that it should remaine and carrie a length with it.

Yet is there one maner besides of planting and maintaining Vines, of a mean or middle nature between couching or interring a branch, by way of propagation, and drawing them thus in a traile from one to another: namely to supplant, that is, lay along vpon the ground the whole stock or main body of a Vine; which done, to cleaue it with wedges, and so to couch in many furrowes or raies, as many parcels thereof, comming all together from one. Now in case each one of these branches or armes proceeding from one body, be of it selfe small, weake and tender, they must be strengthened with long rods like staues bound vnto them round about; neither ought the small sprigs and twigs that spring out of the side, be cut away.

The husbandmen of Novaria rest not contented with a number of these trailed branches, nor with store of boughs and trees to sustaine and beare them, vnlesse they be shored and supported also with posts and ouerthwart raies, about which the yong tendrils may creep & wind. No maruell therefore if their wines be after a sort rough, hard, and vnpleasant: for besides the badnesse of their soile, the maner of their husbandry is so crooked and vntoward.

Our husbandmen moreouer here about vs, neer vnto the city of Rome, commit the like fault, and find the same defect therupon, in the Varracine Vines, that be pruned but once in two yeaes: a piece of husbandry by them practised, not for any good that it doth vnto the vine, but because the wine thereof is so cheap, that oftner pruning would not quit cost, neither doth the reuenue answer the labor and the charges.

In the territorie of Carfcoli (a champion and plain countrey about Rome, the peasants take a better order, and hold a middle and temperat course. For their maner is to prouin and cut away from the Vine those parts onely that are faulty and rotten, when they begin once to drie and to wither, leauing all the rest for to beare Grapes: and thus discharging it of the superfluous burden

burden that it caried, they hold opinion, that it is not good to wound it in diuers places: for by this means (say they) it will be nourished and come on very well. But by their leaue, vnlesse the ground be passing rich and fat, Vines thus ouercharged with wood, will for want of pruning degenerate into the bastard wild wines called Labrusca.

But to returne againe vnto our plots planted with Trees and Vines coupled together: such grounds when they be plowed require a good deep fitch, although the corn therein sown need it not. Also it is not the manner to disburgen or deffoile altogether such trees, and thereby a great deale of toile and labor is sau'd: but when the Vines are a pruning, they would be disbranched at once with them, where the boughs grow thickest; and to make a glade onely thorough, the superfluous branches would be cut away, which otherwise might consume the nutriment of the grape. As for the cuts and wounds remaining after such pruning and debranching, we haue already forbidden, that they should stand either against the North or the South. And I think moreouer it were very well, that they did not regard the West where the Sunne setteth: for such wounds will smart, and be long sore, yea, and hardly heale again, if either extreme cold pinch, or extreme heate parch them.

Furthermore, a Vine hath not the same liberty in a vineyard that it hath vpon a tree: for better means there are, and easier it is to hide the said wounds from the weather flanked as they be within those close sides; than to wryth and wrest them to a mans mind to & fro. In lopping and shredding of trees, when the cut standeth open, there would be no hollow places made like cups, for feare that water should stand therein. Last of all, if a Vine be to climbe Trees that are of any great height, there would be stayes and appuies set to it, wherupon it may take hold, and so by little and little arise and mount vp aloft.

CHAP. XXIII.

¶ The manner of keeping and preserving Grapes. Also the maladies whereto Trees be subiect.

IT is holden for a rule, That the best Vine-plants which run vpon a frame of rails, ought to be pruned in mid-March about the feast of *Minerva*, called Quinquatrus: and if a man would preserve and keep their grapes, it would be done in the wane of the Moone. Also, that such vines as be cut in the change of the Moone, will not be subiect to the iniurie and hurt of any noisom vermin. Although in some other respect men are of opinion, that they should be cut in the night, at the full of the Moone, when the signe is in Leo, Scorpio, Sagittarius, and Taurus: and generally it is thought good to set them when the Moone is at the full, or at leastwise when she is croissant. Moreouer, this is to be noted, that in Italy there need not about ten men for to look vnto a vineyard of an hundred acres.

And now that I haue discoursed at large as touching the manner of planting, grafting, and dressing of Trees, I purpose not here to treat again of Date Trees & Tretrifoly, whereof I haue sufficiently written already in the Treatise of strange and forreine Trees: but forasmuch as my meaning is to omit nothing, I will proceed forward to decipher those matters which concerne principally the nature of Trees, and namely their maladies and imperfections, whereto they also as well as beasts and other liuing creatures, are subiect. And to say a truth, what creature is there vnder heauen freed therefrom? And yet some say that wild and sauage trees are in no such danger: only the hail may hurt them in their budding and blooming time. True it is also, that scorched they may be otherwhiles with heate, and bitten with cold black winds, comming late and out of season: for cold weather surely in due time is kindly and good for them, as hath bin said before. But let me not forget my self. See we not many times the cold frost to kill the very Vines? Yes verily: but this is long of the soile and nothing else; for neuer hapneth this accident but in a cold ground. So as this conclusion holdeth still, That in winter time we alwaies find frost and cold weather to do much good: but we neuer allow of a cold and weake ground. Moreouer, it is neuer seen, that the weakest and smallest trees are indangered by frost, but they are the greatest and tallest that feele the smart. And therefore no maruel if in such, the tops being nipped therewith, seem first to fade and wither; by reason that the natie and radical moisture being bitten and dulled before, was neuer able to reach vp thither.

Now concerning the diseases that haunt Trees: some there bee that are common vnto all; others

others againe, that extend peculiarly, to some certaine kind or other. As for the former sort generally it is, that no trees are exempt from the worme, the blasting, and the joint-ach. Hereof it commeth, that we see them more feeble and weake in one part or member than in another, as if they did participate the maladies and miseries of mankind, so common are the names of diseases vnto them both. For certes, we vse to say indifferently, That trees are headlesse, when they be lopp and topp, as well as men who are beheaded: we tearme their eyes to bee enflamed, sendged, and bloud-storten, when their buds be blasted: & many other infirmities, according to the like proportion. And therupon it is, that we say they be hungerstarued and pined: and contrariwise, that they be full of crudities and raw vndigested humors; namely, when moisture aboundeth in them. Yea, and some of them are said to be grosse and ouerfat, to wit, al such as bear rosin; when by the means of too much greafe (as it were) they begin to putrifie and turn into Torch-wood; yea, and it falleth out, that they die withall, in case the said greafe take once to the roots; even as liuing creatures being ouergrowne with fat. Moreouer, ye shall see a kind of pettilence light amongst one peculiar kind of trees: like as it farth sometimes with men in sundrie states and degrees; whereby one while slaues only die of a plague, another while the Commons, and those either artificians in a citie, or peasants and husbandmen of the country.

Now as touching the Worme, some trees are more subiect vnto it than others: and to say a truth, in manner al, more or lesse; and that, the birds know well ynough, for with their bills they will job vpon the barke, and by the sound trie whether they be worm eaten or no. But what say we to our gluttons and belly gods in these daies, who make reckoning among their dainty dishes, of wormes breeding in trees; and principally of those great fat ones bred in Oakes, which wormes they call Cossi, & are esteemed a most delicat meat? These forsooth they feed in mue, and franke them vp like fat-ware, with good corn-meale. But about al others, Pear trees, Apple trees, and Fig trees, are soonest worme-eaten: and if any trees escape, they be such as are of a bitter wood in tast, and odoriferous in sinell. Touching those wormes that be found in Fig trees, some are engendred of themselves, and of the very wood: others are bred of a bigger vermine called Ceraistes. Howbeit, al of them (which way soeuer they come) are shaped in manner of the said Ceraistes, and make a certaine small noise like the thrill and creaking sound of a little criquet. The Senuise tree likewise is haunted and plagued with little red and hairie wormes, that in the end doe kill it. The Medlar trees also when they be old, are subiect to this maladie.

As for the misliking of trees [called Sideratio] wherby they consume, wither away, & crumble to powder; it is a thing caused only of the weather and influence of some Planet. And therefore in this ranke are to be raunged Haile, Blasting with some vntoward winds, and frosts that bite and nip them to the heart. And verily it falleth out, that in a mild and warme Spring, when plants bee too forward, and put forth their soft buds and tender sprouts ouer-soone, the black wind taketh them on a suddaine, and a certaine rime setteth thereupon, sendging and burning the oilers of the Burgeons, whiles they be full of a milky sap: which accident if it light in blooming time vpon the blossome, is called properly Carbunculus [i.e. Mieldeaw.] As for the Frost at such a time, it is far worse than the blasting aforesaid, for when it falleth vpon any trees or plants, it there resteth and remains still, it congealeth all into an yce, and no puffe of wind there is to remove and dislodge it: for why? such frosts commonly are not but in time of a still, cleer, and calm aire. Touching that manner of Blasting or misliking called Sideratio, as if they were smitten with the maligne aspect of some planet, this danger chanceth peculiarly by some drie and hote winds, which are busie commonly about the rising of the Dog star, at what time wee shall see vong trees and newly grafted, to die outright, especially Figge trees and Vines. The Oliue, ouer and besides the worme (whereto it is subiect as well as the Figge tree) hath another greefe and sorance called in Latin Clavus, Fungus or Patella [i.e. Knur, Pusse, Meazil or Blister] chuse you whether: and nothing is it but a very sendge or burne by the sunne.

Furthermore, Cato saith, That the red Mosse is hurtfull vnto trees. Oftentimes also wee find that as well Oliues as Vines, take harm by ouermuch fertilitie and fruitfulness. As for scab and skurie, what tree is cleare of it? The running mange or tetter, is a mischeefe peculiar vnto the Fig tree: as also, to breed certain Hoddy-dods or shell-Snailes sticking hard thereto and eating it. And yet these maladies are not indifferent and alike in all parts of the tree. For thus you must think, that some diseases are appropriate to one place more than another. For like as men are troubled with the Arthriticall torments, or the Gout, euen so be trees: yea, and after 2 forts

as well as they: for either doth the disease take the way to the feet, that is to say, to the roots, & there breaketh out and sheweth it selfe; or else it runneth to the exterior joynts and fingers, to wit, the final branches and top twigs, which be farthest remote from the main body of the tree. Hereupon then begin they to drie, wither, and waxe blacke: and verily the Greeks haue proper names and termes respectiue to the one infirmity and the other, which we in Latin want. Howbeit we are in some sort able to expresse the Symptomes following therupon; and namely, when we say, first, that a tree is ill at ease, sicke, and in pain euery where: anon, that it falls away, looks ill, poore, and leane, when wee see the fresh green hew gone, and the branches fraile and brittle: last of all, that it is in a waite, consumption, or feuer hecick, and dieth sensibly, to wit, when it receiue no nourishment (or not sufficient) to reach vnto al parts, and furnish them accordingly: and the same Figge tree of al others, is more subiect hereunto; as for the wild, they be exempt wholly from all these inconueniences hitherto named.

Now as touching the scab or scurfe incident vnto trees, it commeth of certain foggie mists and clammy dewes, which light softly and leifurely after the rising of the Brood-hen star Vergilia, for if they be thin and subtile, they drench and wash the trees wel, and do not infect them with the scab: howbeit in case they fall down right, or that there be an ouer great glut of showers and raine, the Fig tree taketh harme another way, namely, by soaking of too much moisture into the root.

Vines, ouer and aboue the Worme and the Blast, haue a disease proper vnto themselves, called Articulation, which is a certain barraineffe of theirs when they leese their spring in the verie joynt. And this may come vpon three causes: the first, when by vnseasonable and ill weather, as frost, heat, haile, or other torrible impressions of the aire, they forgoe their young sprouts: the second (as *Theophrastus* hath well noted) if in pruning of them, the cut stand vprward and open to the weather: the third, when they be hurt by those that haue the dressing of them, for want of skill and taking good heed: for all these wrongs and inconueniences they fee in their joynts or knots. A feuerall kind of blasting or mortification there is besides in vines, after they haue done blooming, which is called Roratio; namely, when either the grapes do fall off, or before they come to their full growth, be baked (as it were) into a thick and hard callositie. It happens also that they be otherwhiles sick, in case after their pruning, their tender oilers or buds be either bitten with the frost, or singed with some blast. The same befallth likewise to them vpon some vntimely or vnseasonable heat: for surely in all things, a certaine measure and moderate temperature doth well, to bring them to their perfection. To say nothing of the wrong that is done vnto them by the vine-masters themselves and husbandmen as they dresse and trim them, namely, when they bind them ouer-streight, as hath been said before, or when the labourer that diggeth about them, chaunceth to do them one shrewd turne or other by some crooked crosse blow; or else when the ploughman at vnawares doth loosen the root, or glance vpon it with the share, and so disbarke the bodie of it: finally, they haue iniurie done vnto them, in case the pruning-hooke bee ouer blunt, and so giue them a bruse. In regard of all these causes, they are lesse able to beare either cold or heat; for euery outward iniurie is readie to pierce their fresh galls, and a skald head is soon broken. But the tenderest and weakest of al others, be the Apple trees, and namely, the hastie kind that bringeth sweet Iennitings. Howbeit some trees there be which vpon such feebleness and hurt done vnto them, become barren onely, and die not; namely, the Pine and Date tree: for if a man fetch off their heads, you shall see them faile in bearing fruit, but this hurt will not kill them quite.

Moreover, it falleth out otherwhiles, that the Apples only or other such fruits, as they hang are diseased, when as the tree aileth nothing; to wit, if in due time they wanted rain, warmth, or winds that were needfull, or contrariwise, if they had too much of euery one: for by such means they either fall from the tree of themselves, or els they are the worse for it, if they proue worth ought at all.

The greatest displeasure that can happen to Vine or Oliue tree, is, when in their very blooming they be pelted with violent showers of raine; for, together with the blossome, down goeth the fruit of them both. From the same cause, proceed the cankerwormes or caterpillars (a most dangerous and hurtfull kind of vermine to trees) which will eat out the Greene bud, knot and all. Others there be that wil deuoure the blossome and leaues of Oliues also, as in *Miletum*: and thus hauing consumed all the Greene leaues, leaue the trees bare, naked, and ill-fauored to the eye

A eye. These wormes doe breed in moist and warme weather, and especially if there be thick and foggie mists. Of the same vermine, there is another engendred, namely, if there ensue vpon the former wet season, hotter gleames of the sunne more than ordinarie, which burne the foresaid wormes, and therefore change them into other vermine. Moreover, there is a fault or imperfection besides, wherto Oliues and Vines especially are subiect, and this they call in Latine *Ara-neus*, [i. the Spider] when cobwebs (as it were) doe enfold and wrap their fruit, keeping them from growing, and so in time killing them. Ouer and besides, there be certaine winds which singe and burne Oliues and grapes principally, yea and all sorts of fruits whatsoeuer. In some yerres also ye shall see all Quits worne-eaten, and especially Apples, Peares, Medlars, and Pomegranats, without any such hurt and offence to the trees that bear them. As for Oliues, the worm sometimes doth them harme, otherwhiles good: for if the worme be engendred and formed before it take the Oliue, it consumes and spoileth the fruit; but in case they breed within the kernel, it causeth the Oliue to thriue the better, by eating the said kernel that drew away and sucked the humor which nourished it. The rain that falleth after the rising of the starre *Arcturus*, hindereth the generation of wormes, and preferueth fruits from being worne-eaten: and yet if the wind sit Southward in that time when it so raineth, such raine will breed worms in oliues especially, called *Drupa*; which beginning but then to ripen, are most readie to fall from the tree. And verily those trees that grow in waterie places or neer riuers, are more subiect to haue worne-eaten fruit, which although it fall not so soone, yet it is as loathsome euery way.

Ouer and besides, there is a certaine kind of flie resembling the Gnat, which annoieth some trees and their fruits, and namely, Mast and Figs: and it seemeth that this flie is engendred of a certaine sweet humour that lyeth vnder their barks. Thus much as touching all diseases to speake of, that trouble trees.

As for the impressions of the Aire at certaine seasons, as also of other accidents occasioned by the climat, they are not properly to bee called Maladies, because they kill trees sodainly: as namely, when a tree is blasted outright, or all at once doth wither and drie away: like as when some puffe of an vntoward wind peculiar vnto any region, doth smite them: such as in *Apulia* they call * *Atabulus*, and in *Euboea* is named *Olympias*: For if this wind chaunce to blow in mid-winter, it biteth, burneth, and drieth vp trees with such cold blasts, as afterwards no heat of the Sunne is able to recouer againe. In this sort likewise, al trees growing in vallies or standing along riuers sides, bee endangered: and aboue all others, Vines, Oliues and Figge trees. This death that they thus take, is soone after discovered and seene in the budding time when trees begin to put forth, how soeuer it be later ere the Oliue shew it. Howbeit, a good signe it is in them all of their recovery, when they lose their leaues: for you shall see the leaues tarie on in many of them, and when you think they are past the worst, sodainly die. Otherwhiles also you shall haue the leaues to fade and seeme drie, yet afterwards the same trees to reuiue againe, and become Greene. Furthermore, in the Northerly regions, as in *Pontus* and *Phrygia*, some trees there are that be ordinarily frozen to death; namely, when the frost and yce continueth after mid-winter fortie daies. And not onely there, but also in other countries, if immediatly after that trees haue put forth their fruit, there follow a hard frost, they wil die vpon it, although the frost last not many daies.

In a second ranke of causes that may kill trees, are to be ranged the injuries and wrongs that come by mans hand, Pitch, oyle, and greafe, are very enemies and hurtfull to them al, but especially to young trees. Again, if trees be barked round about, they will die all, vnlesse it be the Corke tree; for it will thriue and prosper the better, if it be in that wise discharged of the outward barke; for growing as it doth ouer thicke, it claspeth and clingeth to the tree so hard, that it choketh and strangeth it again. Neither doth the tree *Adrachne* find any hurt or offence by disbarking, vnlesse the very wood be cut also together with it. As for cherie trees, *Lindens*, and Vines, it is ordinarie with them to cast ther barke in some sort, and take no harme thereby; but it is not the vital and liuely inner barke indeed which is next vnto the bodie, but that onely which by comming of another underneath fresh and young, is driuen forth and thrust out.

Some trees there be, which naturally haue their barke full of chaps and rifts, as the Planes for example. As for the *Line* or *Linden* tree, if it chance to leese the barke, it will come in manner whole and entire againe. In such therefore the manner is, by way of cure to close vp againe with clay and dung, the naked and bare place; and so to bring it to a cicatrize: and, I assure you,

A a a

this

* quasi arbor
pudens, scales
miserum, aut
pestem inferens

this practise sometimes speeds well, and doth the deed; provided alwaies, that the naked place were not surpris'd before the cure, with extremity either of cold or heat. Certaine it is, that by this means both kinds of the Oke, as wel the Robur as the Quercus, liue the longer, and die nothing so soone as otherwise they would. And herein the time of the year ought to be considered, when a tree is thus pilled and disbarked: for in case that a man pill the barke of the Firre or Pine tree, during those months wherein the sunne passeth thorough the signes of Taurus or Gemini, which is the very season of their budding, there is no way but one with them, for presently they die: but if this wrong should befall them in winter, they would abide it the better and longer liue, than being so misused either in Aprill or May. The same is the case of the mast-Holme, the wild Robur also, and the common Oke. Howbeit, take this note by the way, that if the void place where the tree hath bene barked round about, be but narrow, so as the brims of the barke remaining be not farre asunder, the trees aforesaid will take no harme at all thereby. Many in the tenderer sort, and such as a man may say are but of a weake complexion, and growing besides in a leane and hungry ground, if the barke be taken away but of one side and no more, it is enough to kill them.

The like may be said of the topping or beheading the Cypresse, the Pitch tree, and the Cedar: for let these haue their heads either cut off with an axe, or burnt by fire, they will die, there is no remedie. As much also is to be said, when beasts doe brouse and eat them. As for the Oliue tree, if a Goat chance but to lick thereof, it will thereupon proue barraine and beare no more Oliues; so saith *Varro*, as we haue noted heretofore. But as some trees vpon the like injury done vnto them, will die, so others againe will be but the worse for it, and such are the Almond trees: for where before they did beare sweet Almonds, they will euer after bring bitter. Moreover, you shall haue some trees, that wil thrise & do the better after this hard dealing, & namely a kind of pearre tree called Phocis, in the Island Chios: for you haue heard by me already, which trees they be that lopping and shredding is good for.

Most trees, and in manner all (except the Vine, Apple tree, and Pomegranate tree) will die, if their stocke or bodie be clouen: and some be so tender, that vpon euery little wound or race that is giuen them, yee shall see them to die: howbeit, the Figge tree and generally all such trees as breed Rosin, desie all such wrongs and injuries, and will abide any wound or bruse whatsoeuer.

That trees should die when their roots are cut away, it is no maruell: and yet many there bee of them, that wil liue and prosper well neuerthelesse, in case they be not all cut off, nor the greatest master roots, ne yet any of the heart or vitall roots among the rest.

Moreover, it is often scene, that trees kill one another when they grow too thicke; and that either by ouershadowing, or else by robbing one another of their food and nourishment. The Iuice also, that with clipping and clasping bindeth trees too hard, hastneth their death. Misleto likewise doth them no good; no more than Cytisus, or the hearbe Auro, which the Greekes name Alimus, growing about them. The nature of some plants is, not to kill and destroy trees out of hand, but to hurt and offend them only, either with their smell, or else with the mixture and intermingling of their owne iuice with their sap. Thus the Radish and the Lawrell doe harme to the Vine if they grow neare vnto it: for surely the Vine is thought to haue the sense of smelling, and wonderfully to sent any odours: and therefore it is obserued in her by experience, That if shee be neare vnto Radish or Lawrell, shee will turne away and withdraw her selfe backward from them, as if shee could not abide their strong breath, but vtterly abhorred it as her very enemy. And vpon the obseruation of this secret in Nature, *Androcles* the Physitian deuised a medicine against drunkenesse, and prescribed his patients to eat Radish if they would not be overcome with wine. Neither can the Vine away with Coleworts or the Cabbage, nay it hateth generally all worts or pot-herbs: it abhorreth also the Hazell and Filberd tree; in such sort, as a man shal sensibly perceiue it to looke heauily and milke, if those plants aforesaid grow not farther off from it. And now to conclude and knit vp this discourse, would you kill a Vine out of hand? lay to the root thereof nitre or salt-petre, and alumne, drench it with hote sea-water: or doe but apply vnto it Bean cods, or the shales or husks of the pulse Ervile, and you shall soone see the operation and effect of a most ranke and deadly poison.

CHAP.

CHAP. XXV.

¶ Of many and sundry prodigies or strange tokens and accidents about trees. Also of an Oliue plot which in times past was transported all and whole, from one side of an high port way, to another.

IN this Treatise of the faults and imperfections incident to Trees, me thinks I should dowel to say somewhat of the supernatural occurrences in them obserued: for we haue known some of them to grow vp and prosper without any leaues at all. And as there haue bin Vines and Pomegranats seen to beare fruit, springing immediately from the trunk, and not from branch or boughs: so there haue bin vines charged with grapes, and not clad with leaues: and Oliues likewise had their berries hanging vpon them whole and sound, notwithstanding all their leaues were shed and gon.

Moreover, strange wonders and miracles haue hapned about trees by meere chance and fortune: for there was an Oliue once, which being burnt to the very stump, reuiued & came again: and in Beotia, certain Fig Trees, notwithstanding they were eaten and gnawn most piteously with Locusts, yet budded anew, and put forth a fresh spring. Also it hath bin marked, that trees haue changed their colour from black to white. And yet this is not alwayes a monstrous thing beyond naturall reason, and specially in such as come of seed, as wee may obserue in the Aspe, which eftsoues turneth to be a Poplar. Some are of opinion, That the Seruise Tree if it bee transplanted, and come into a hotter ground than is agreeable to the nature thereof, will leaue bearing, and be barren. But it is taken for no lesse than a monster out of kind, that sweet Apples and such like fruits should proue sowre, or sowre fruit turne to be sweet; as also that a wilde Fig Tree should become tame, or contrariwise. And it is counted for an vnluckie sign, if any Tree change from the better to the worse; to wit, if a gentle garden Oliue degenerate into the wilde and sauage: if a Vine that was wont to beare white grapes, haue now black vpon it; and so likewise if a Fig Tree which vsed to haue white Figs, chaunce afterwards to beare black. And here by the way I cannot forget the strange accident that befell in Laodicea, where vpon the arriual of King *Xerxes*, a Plane tree was turned into an Oliue. But if any man be desirous to know more of these and such like miracles, for as much as I loue not to runne on still and make no end, I refer him ouer to *Aristander* a Greek writer, who hath compiled a whole volume, and stuffed it full of such like wonders: let him haue recourse also to *C. Epidius*, a Countryman of ours, whose Commentaries are full of such stuffe: where he shall find also, that trees sometimes spake.

A little before the ciuil war brake out between *Julius Caesar* and *Pompey* the Great, there was reported an ominous and fearfull sight presaging no good, from out of the territory of Cumes, namely, That a great Tree there sunke down into the earth so deep, that a very litle of the top boughs was to be seen. Hereupon were the propheticall books of *Sibylla* perused, wherein it was found, that this prodigie portended some great carnage of men; and that the nearer that this slaughter and execution should be to Rome, the greater should the blood shed be.

A prodigious signe and wonder it is reputed also, when trees seem to grow in places where they were not wont to be, and which are not agreeable to their natures; as namely on the chapters of pillars, the heads of statues, or vpon altars: like as to see one tree of a diuers and contrary kinde growing vpon the top of another; as it befell about the city *Cyzicum* hard before the strict siege that was laid vnto it [by *Mithridates*] both by sea and land, where a Fig tree was seen to grow vpon a Lawrell. Likewise at *Tralleis*, about the time of the foresaid ciuill war, a Date tree grew out of the base or foot of a Colunne that *Caesar* Dictator caused there to be erected. Semblably at Rome also, twice during the war between the Romans and *K. Persus*, there was a Date tree known to grow vpon the lanterne or top of the Capitoll temple, foreshewing those victories and triumphs which afterward ensued, to the great honor of the people of Rome. And when this was by stormes and tempests ouerthrowne and laid along, there sprung vp of it selfe in the very same place a Fig tree, at what time as *M. Messala* and *Caius Cassius* the two Centors, held their Quinquennall solemn sacrifices for the assailing and purging of the city of Rome. From which time *Piso* (a renowned Historiographer and Writer of good credit) hath noted, that the Romans were giuen ouer to voluptuousnesse and sensuality, and that euer since all cha-

Aaa 2

stirre

* Or as some
rend, the head
of Iupiter

pitoll.

stittie and honest life hath bin exiled. But aboute all the prodigies that were euer seen or heard, there is one that passeth, and the same hapned in our age, about the very time that *Nero* the emperor came to his vnhappy end and fall: for in the Marrucine territorie there was an olue garden belonging to *Vestius Marcellus* a right worshipfull knight of Rome, which of it selfe remooued all and whole as it stood, ouer the broad highway, to a place where lay tillage and earable ground: and the corn lands by way of exchange crossed ouer the said causey againe, and were found in lieu of the Olue plot or hortyard afore said.

CHAP. XXVI.

¶ *The remedies for the maladies and diseases of Trees.*

Now that I haue declared the diseases of Trees, meet it is that I should set down the cure and remedies thereto. Where this one thing would be first noted, That of Remedies, some be common to all trees, others appropriate to certain. Common be these following, To bare and cleanse the roots, to hil and bank them again; that is to say, to giue aire vnto the roots, & let the wind into them; and contrariwise to couer them, & keep both wind & weather from them: to water them, or to deriue & diuert water from them: to refresh their roots with the fat liquor of dung: to discharge them of their burden by pruning their superfluous branches. *Item*, to giue their humors issue, and as it were by way of phlebotomie to let them blood, and to skice and scrape their bark round about, in maner of scarification. To take downe their strength and keep them vnder that they be not too lusty & proud. Also, if the cold hath caught their buds or burgeons, & thereby caused them to look burnt, rough, and vnpleasant, to slick, polish, & smoothe them again with the pumy stone. These verily be the diuers helps to cure trees: howbeit, vfed they must be with great discretion, for that which is very good for one, is not so good for another: and some trees require this course, others that, to be taken with them. As for example, the Cypres tree cannot abide either to be dunged or watered, it hateth all digging and deluing about it, it may not away with cutting and pruning, it is the worse for all good physick, nay, all remedies to others are mischiefs to it, and in one word, go about to medicine it you kill it. All Vines, and Pomegranat trees especially, loue a life riuer sides, & desire to be watered, for thereby will they thrive and prosper. The Fig tree also it selfe is nourished and fed in waterie grounds: but the fruit that it beareth is the poorer by that means. Almond trees if they be plied with digging, will either not bloome at all, or else shed their floures before due time. Neither must any yong plants or trees newly grafted, be digged about their roots, before they haue gathered sufficient strength and begin to beare fruit. Most trees are willing enough to be disburdened of their superfluous and ouer-rank branches, like as we men can spare our nails to be pared, and bush of hair to be cut, when they be ouergrowne. As for old trees, they would be cut down hard to the ground, for finally they rise again of some shoot springing from the root, and yet not all of them. Regard therefore must be had, that none be so vfed but such (as we haue noted before) as are able of nature to abide it. For trees to be watered at the roots in the heate of summer, it is good, but in winter it is as bad. In the fall of the leaf it may be wholsom, it may also be hurtfull, and therefore the nature of the soile would be considered: for the grape-gatherer in Spaine meeteth with a good vintage, notwithstanding the Vines stand in a marish and fennie ground; howbeit in most parts of the world besides, it is thought good husbandry, to draine away from the roots the very rain water that falls from aboute in Autumne. About the rising of the Dog-star, trees desire most of all to be wel watered; and yet they would not haue too much thereof euen in that time, for in case their roots be ouer-drenched and drowned therewith, they will catch harm. Herein also the age of trees is to be respected, which in this case prescribeth what is meet and sufficient: for yong trees be lesse thirsty than others: also Custome is a great matter. For such as haue bene vfed vnto watering must not change their old wont, but they require most of all others to be vfed so still. Contrariwise, Those Trees which grow vpon dry grounds naturally, desire no more moisture than that which is needful. In the territory about Sulmo in Italy, and namely within the Liberties of Fabianum, the Vines which doe beare the harder and sower Grapes, must of necessitie be watered. And no manuaile, for the verie lands and Corne-fields vse to haue water let in vnto them. And here a wonderfull thing is to be obserued; This water cheriseth the Corne, but killeth all the hurtfull Graffe among: and the

A the riuer overflowing the lands, is as good as a weeding. In the same countrey the maner is in midwinter to open a sluice or draw vp their floodgates, for to ouerflow their vine roots with the riuer: and so much the rather, if either it be an hard frost, or snow lie vpon the ground: And why so? because the pinching cold should not burne them: and this they call there by the name of *Tepidare*, [i. to giue them a kindly warmth as in a stouue:] see the memorable nature of this only riuer, to be warme in winter, and yet the same in summer is so cold, that hardly a man can endure his hand in it.

CHAP. XXVII.

¶ *Of scarification or scarifying trees: also the maner of dunging them.*

Touching the remedies for blasting as well by heat as cold, I will treat in the booke next following. Meane while I cannot omit one manner of cure by way of Scarification. For when the bark is poore and lean, by reason of some disease or milke, so as it clogs together, pressing and binding the quick wood ouermuch, whereby the tree is as it were hide-bound, they vse to slit the same along with a very sharpe cutting hooke, guiding and gaping the edge thereof with both hands, that it goe not ouer-deep: and so by these incisions they doe open it, and as it were losen and enlarge the skin. Now, when this feat is wrought, the onely signe that it is wel don and good for the tree, is this, if the incisions in tract of time appeare wide, and the void place incarnate again and fill vp with a kind of callous substance, compounded of the sap, and wood together growing betweene. Whereby it appeareth, that in many cases the cure of mens maladies & the diseases of trees is very like: for that euen their bones also vse to be trepanized and bored through as well as ours. Also for to make sweet almonds of bitter, first the tree must be digged round about, and then boared thorough with an auger toward the root or butt end, whereby the waterish humor that runneth downward, may issue forth and passe away. Moreouer, if a man would discharge Elmes of their superfluous moisture, they must be pierced with a wimble, a little aboute the ground, as far as to the very heart or pith, if either they be old, or be perceiued to receiue ouermuch nutriment. In like maner the same excessive humor is let out of Fig trees by meanes of certaine light slits or gathes made in the barke, aslant or byas, in case it seeme to swell and be ouer-streight, and by this deuise they preuent the falling of their fruit.

D Generally, what trees soeuer beare Apples, or such like soft fruit without, if they chauce at any time to proue barren, that is to say, to put forth leafe only without any fruit, the vse is, first to make a clift in the root; then, to put a stone therein, that the edges meet not and rejoin againe; and so they become fruitfull. The same is practised in Almond trees also, but instead of the stone there must be a wedge of Oken wood driuen in. As for Pyrries and Medlar trees, those wedges must be made of Pine Torch-wood. Moreouer, if either vines or fig trees, be ouer-ranke of wood, it is very good to cut and skice the roots round about, and when they bee thus serued, to couer with ashes the said incisions: but then they must bee close couered with ashes and earth aloft. If ye would haue trees beare Figs at the later end of the yere, pluck off the first green figs so soon as they be somewhat bigger than Beans: for vnder them there will other come vp in the place, and be later ere they wax ripe. The same fig trees when they begin to spring leafe and look green, if the top-twigs of euery bough be cut off, become the stronger & more fruitfull by it. For as touching the ripening of Figges by Caprification, true it is, that there be certain flies like gnats engender in Greene figs, which are the occasion thereof, for when they are flown out, there are no graines or seeds found within: whereby it is euident, that they be turned into those flies. And when they do fly forth, so hasty they are to be gone, that many of them as they brake out, leaue either a foot or a wing behind them. Besides, another kind there is of gnats, which they call Centtine, for sloth and shrewdnesse like in al the world to Drone-bees, so mischieuous they be to the good flies or gnats indeed, that cause the Figs to ripen: for, when they kill, and die themselues when they haue done. Moreouer, there be certaine wormes like moths that ordinarily do much hurt to the graines or seeds within figs, and eat them quite: The only remedie against this vermine, it is to take a twig or imp of the Italian Lentisk tree, and to set or couch it with the wrong or top end downward, in the very same trench where the fig tree was planted, for to haue fig trees beare most plentifully, take ruddle or red-earth tempered wel with the lees or grounds of oile, after that the same is mixed with dung, poure it to the roots of the

trees when they begin to put forth leaues. Among wild Fig trees, the best be the black & those that grow in stonie grounds: for their Figges are fullest of cornes or graines within. And as for caprifigation, it would be practised after rain. And take this for a generall rule, That ye beware in any hand in curing of trees, least yee vse a mischeefe for a remedie, a thing that commonly happeneth by ouer many medicines, or the same not applied in due season: for as it is very good for trees, to cut and lop off their boughs where they grow too thicke: so to be hacking and mangling of them euery yeare, hurteth them as much. As for the vine, it requireth pruning once a yeare: but the Myrtle trees, Pomegranate, and Oliue trees, euery two yeares; because they will quickly spring againe a d shoot forth branches thicke. Other trees would not be lopped so often. Neither is it good to cut or prune any whatsoeuer it be, at the fall of the leafe. Nay, they are not so much as to be scraped, but in the pruning time, that is, in the Spring. All wounding of trees goes to the very heart, and hurt the quick, vnlesse it be of those parts that are superfluous. As great consideration there would be had in the manner of mucking them. No doubt, they loue dung well: but carefull heed would be taken first, that none be laid to the roots in the hottest season of the yeare. Item, That it be not Greene, but thoroughly rotten: lastly, that it be not ouer ranke nor stronger than is needfull, Swines dung burnes the root of vines, vnlesse it be five yeares old, or the vines stand in some place where water is at commaundement for to coole the excessive heat thereof. Also the filth of Tanners ooze and Curriers scrapings doe the like, if they be not well delaid with water. Likewise it must not be laid too thicke. The ordinarie proportion is thought to be for euery ten foot square, three Modij of dung. But herein no certaintie can be set downe: for the nature of the soile must rule all. With Swines and Pigeons dung, they vse to soulder the cuts and wounds that are giuen to trees. In case the Pomegranats grow to be tart and soure, the manner is to dig about the root and lay it bare, and then to put Hogs dung thereto: for that yeare the Pomgranats will be full of a wine iuice; and the next yeare following proue sweet. Some good husbandmen there be, that think it meet and requisit foure times a yeare to water their roots with mans vjine and there water together, and vpon euery one they bestow a whole Amphore. Or else to bedeaw and sprinkle the top branches of the Pomegranat trees with witte, wherein Laster hath bene steeped. When the pomegranat doth cleaue & open vpon the tree, it is good to wreath the steale therof. If Figs doe the like, there would be oile lees cast vpon them. Other trees when they are amisse or doe mislike, ought to be drenched with wine lees and Lupines if they be set about their roots, will helpe them. The water also or decoction wherein Lupines were foddren, poured about the roots of Apple trees or such like, doth them much good. If it happen to thunder about the feast Vulcanalia, Figs will fall from the tree. The remedie thereof is to strow the plots before with Barley straw. Would you haue hastie Cherries? Lay lime to the roots of the tree, it will cause them to ripen their fruit speedily. Of al fruits these hastie Cherries would be plucked and gathered as they ripen, to the end that those which be left behind, may thriue and grow big and faire.

CHAP. XXVIII.

¶ Many and sundrie medicines seruing for trees, to wit, remedies against venomous vermine and Pismires, likewise against all hurtfull beasts.

Some trees there be which are the better for wrong and injurie done vnto them: yea, and if they be pinched or bitten, they shoot vp the rather, as Date trees and the Lentisks, for euen the very salt water nourisheth them. And true it is, that ashes hath the like nature and vertue that salt, howbeit, more mild and gentle. Hereupon it comes also, that Fig trees vse to be strewed therewith, yea, and to be wet with the iuice of Rue, to the end, that neither their fruit should proue worm-eaten, nor their roots putrifie and rot. Moreover, if vines be too full of moisture and apt to bleed ouermuch, it is an ordinary thing to pour salt water to their roots. Also, in case their grapes be apt to fall, folk vse to take ashes and besprinkle them with vinegre, and so to besmeare the roots therewith: or els with red Orpiment, in case the grapes be giuen to putrification. Say that vines be barren and will not bear grapes, their roots ought to be wel drenched and dawbed with sharp vinegre and ashes incorporat together. But what if a vine bring not her fruit to full maturity, before it begin to wax drie and to wither? the superfluous wood ought to be cut away about the root, and the cuts together with the small strings or beard of the root to be

A be wet and soked in sharp vinegre, and stale chamber-lee, and then they should be well couered and stopped with a kind of mortar made therewith, and often digged about. As for Oliues, if they make shew of smal increase, their roots must be bared and laid open to the cold in winter; for by this manner of chastisement they will amend and do far better.

In all these remedies, proceed we must according to the course of the yere: for sometime the season requireth, that the meanes should be sooner vsed, and otherwhiles later. Some plants there be that fire is good for, and namely, canes and reeds: for if they be burnt, they will come vp againe the thicker and more smooth. As for Cato, hee hath certain compound medicines for trees, distinct by sundry measures by him prescribed: for he hath ordained to the roots of the greater trees an * Amphore, but of the lesse an * Vrna only, of Oile dregs, with an equall quantity of water: all which being tempered together, he would haue to be poured by little & little to the roots, but they ought before to be digged about and laid bare. And for the Oliue, he addeth moreover, that the roots should haue a bed of litter or straw made before, and then vsed accordingly. In like manner also would the fig tree be serued: but especially at the roots of it there should be raised a bank of old earth; for by that means it wil come to passe, that the green figs will not fall, they will beare more plenteously, and the fruit be more smooth and pleasant. To preuent in like manner, that the worne * Convolvulus bred not in a vine, hee appointed two gallons of oile dregs or lees, to be boiled first to the thicke consistence of hony, and then afterwards to take a third part of the slime Bitumen, and a fourth part of brimstone, and seethall together again in the open aire; for within dores there would be some danger of setting the house a fire. With this mixture, if a vine be well annointed about the ioints, and vnder their hollow arm-pits, he assureth vs, that there will no such worne breed therein. Some content themselves to perfume vines onely with the smoke of this composition, so as it be done on the winde-side, that it may carry the fume directly to them; and this should be continued for three daies together. Many are of opinion, that wine being mingled with like quantity of water (because alone of it selfe it is hurtfull) is as good for this purpose as the oile dregs abouesaid, which Cato hath prescribed. Another kind of vermin or worne there is, that gnaweth the tender buds or burgeons of the vine, and the same is called Volvox: to preserve vines from this harmefull creature, men are wont to take their vine-hooks when they be newly ground and sharpened, then to scoure them with a Beauers skin, and with them to prune the vines: or else after they be pruned, to annoint them with bears blood. Moreover, Ants or Pismires make foule work otherwhile among trees. If you would driue them away, daub the stock or butt end with red Sinopre and Tar tempered together. Or do but hang vp any fish neere by, and all the Pismires wil leaue their former haunt, and gather about it. Others make no more ado, but stampe Lupines with oile, and therewith annoint the roots. Many there are, who kill both them and Mouldwarps with oile dregs. Also, against Palmer-worms or Caterpillars, and to keepe Apples from rotting, they giue order for to annoint the top twigs and branch ends of trees with the gal of a green Lizard. But more particularly against the said caterpillars, they would haue a woman whilst her monthly sickness is vpon her, to go round about euery tree by it selfe, barefooted and barelegged, vnbraed and vnaced, and her haire hanging about her cares. Moreover, to preserve trees from wilde and noisome beasts, that none of them come neare to bruiise and marre their green spring, they doe appoint to bespreint their leaues with Greene Cow or Oxe shearne, and water together, betweene some showers, that the rain may wash away the malice and hurtfull quality of the medicine. A wonder to see how inuentiue men are to deuise remedies for euery mischiefe, for many you shal haue, who be verily persuaded, that there are certain charms & enchantments to driue away the haile. But for mine own part, I thinke it meere mockery to set downe the very words, although Cato hath done it before me. Who also speaketh of another spell for dislocations or members out of ioint (an accident happening to trees) which he would haue to be ioined close within the clift of canes. The same writer hath permitted men to cut down sacred groues, trees also dedicated for religion and sequestred from profane vse (after a solemne sacrifice to the gods first performed:) the reason and manner whereof he hath put downe in a certaine treatise, which hee compiled of purpose as touching that argument.

* Amphora, or Quatrant, was a measure Romane of liquor, containing 16 Congij which is about 16 wine gallons.
* Vrna, is halfe Amphora, to wit, 8 Congij, or thereabouts.
* Vine fire, or the Diuels gold-tinge.

THE EIGHTEENTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIUS

SECVNDVS.

CHAP. I.

¶ Of the exceeding loue and affection of our ancestors in old time to Agriculture and Husbandrie. Also, of their singular paines and diligence about Gardens.

Now followeth the treatise of corn, of Gardens, and Floures, and generally of all things else, that by the goodnesse of Nature the Earth bringeth forth bountifully, besides Trees and Shrubs. The speculation whereof verily is infinit, if a man do but consider the number and variety of Herbes and Floures, together with their odors and colors; the diuersity also of their iuices, their seuerall vertues and properties, whether it be to cure men of their maladies, or to giue them pleasure and contentment to their senses. But before that I enter into this discourse, very willing I am to take in hand the cause of Earth (the common mother of vs all) and to assist her against all slanderous imputations, notwithstanding I haue in the beginning of this my worke pleaded once already in her defence. For when we looke into the matter within her contained, we are set on fire inwardly to find fault with her for breeding and bearing noisome things, charging vpon her our own faults, and imputing to her that, for which we of right ought to be blamed. Set case she hath brought forth poison and venom, Who hath searchad them out but man? As for the fouls of the aire and wild beasts, it is sufficient that they touch them not, nay they know how to beware and auoid them. For say that the Elephants doe file their teeth sharp against hard trees, say that the Rhinoceroses whet their horns against the rockes, and the wild Bores sharpen their edge tuskes against both stocke and stone: say that all creatures know well enough how to prepare and frubbish their weapons to do mischief, which of them all yet infect them with poison, but man alone? we haue the cast to envenome and poison arrowes; we can tell how to put something to our darts of yron and Steele, more hurtfull and mischieuous than they be. It is ordinary with vs to poison riuers also; yea & the very Elements whereof the world doth stand, are by vs infected: for euen the aire it selfe, wherein and whereby all things should liue, we corrupt to their mischief and destruction. Neither can we truly say or think, that other creatures besides vs are ignorant of these poisons; for we haue already shewed, that they are not to seeke either what defencatiues to provide against they should fight with serpents, or what remedies to find for their cure after they haue fought and are hurt. Moreover, setting man aside, there is no creature furnished or armed with any other venom, but their own. We cannot chuse therefore but confesse our great fault and deadly malice, in that we rest not contented with naturall poisons, but betake our selues to many mixtures and compositions artificiall, made euen with our owne hands. But what say you to this? Are not some men themselves meere poisons by nature; for these slanderers and backbiters in the world, what doe they else but lance poison out of their black tongues, like hideous serpents? what doe these enuious persons, but with their malicious and poisonfull breath sidge and burne all before them that they can reach or meet with, finding fault with euery thing whatsoeuer? Are they not well and fitly compared to these cursed fouls flying in the dark, which albeit they sequester themselves from

A from birds of the day, yet they bewray their spight and enuy euen to the night and the quiet repose thereof, by their heauie grones (the only voice that they vtter) disquieting and troubling those that be at rest: & finally, all one they be with those vnluckie creatures, which if they happen either to meet or crosse the way vpon a man, preface alwaies some ill toward, opposing themselves (as it were) to all goodnesse, and hindering whatsoeuer is profitable for this life. Neither do these monstrous and abominable sprites know any other reward of this their deadly breath, their cursed and detestable malice, but to hate and abhor all things. Howbeit, herein may wee acknowledge and see the wonderfull maiestie of dame Nature: for like as she hath shewed her selfe more fruitfull and liberall in bringing forth profitable and holefome plants, in greater plenty than hurtfull and noisome; so surely hath she furnished the world better with good men and vertuous for the weale publick. In which regard and consideration, we also taking no small joy and contentment (leauing these troublesome spirits to themselves for to broile and frye in their owne greace) will go on forward and proceed to declare the rest of Natures workes; and with the better resolution, for that wee seeke more pleasure and contentment in the paines and trauell that we take, than expect any fame or bruit of men afterwards. For why? we are in hand to speake of the countrey and countrie commodities, such as in old time like as they were most necessary for this life, so they were accounted and honoured most highly.

CHAP. II.

¶ Of the first guirland or chaplet made of herbes and floures at Rome.

The first order that K. *Romulus* instituted in Rome city newly built, was the guild or fraternitie of certaine Priests or Wardens ouer corn fields, which were in number twelue. And for to do the greater honour to this company, he caused himselfe to be called the twelfth brother among them: and *Acca Laurentia*, the nourse or foster-mother of this Prince, bestowed vpon him a garland of corn eares, twisted and tied together with a white ribband, as the most sacred badge and ensigne of this new Priesthood, which he and his brethren should weare with great reuerence and deuotion: and this was the very first chaplet known at Rome. Now the honor of this ornament was perpetuall, and continued for terme of life; so as a man once inuested therein, could not be degraded and deprived thereof, though hee were banished or taken prisoner; it accompanied him euer to his dying day. Then, and in those daies, euery man within the whole body of the people of Rome, contented himselfe with two acres of land, and King *Romulus* assigned to none of his subiects a greater proportion: whereas now ye shall haue those that erewhile were but slaues and seruants vnder the emperor *Nero* (despising as not sufficient, green enclosures and gardens of that compasse) must haue fish-pooles also bigger than so: and well it were if they would stay there and go no further, for shortly we shall see some one or other of them, neuer rest vntill he haue kitchins also more than two acres wide. And thus much for king *Romulus*.

King *Numa* his successor, ordained to worship the gods with an oblation of corne, yea and to offer prayers and supplications vnto them by no other means, than cakes made of salt and meal: yea and as *Hemina* mine author saith, for to induce the people of Rome the better vnto it, he allowed them to parch their corne in their sacrifices; for that corne thus parched, was supposed to be a more wholsome food: by which meanes, this one thing insued in the end, that no corne was counted pure and good, nor fit to be vsed in diuine seruice, but that which was thus baked or parched. He also instituted the feast *Fornacalia*; to wit, certaine holy daies for the parching and baking of corne: as also another as religiously obserued, called *Terminalia*; namely, for the bounds and limits of lands: for these and such like gods, as then, they worshipped most: as also the goddesse *Seia*, so called *as erendo*: [i. of sowing corne and setting plants:] and *Segesta*, which name they gaue her *as getibus*, [i. of corn fields:] whose images we at this day do see in the grand Cirque or Shew-place at Rome. A * third goddesse there is among them, whom to name and invoke within house, they might not with safe conscience. Lastly, so religious and ceremonious they were in old time, that they would not so much as taste of new corne or wine, before the Priests had taken a fey of the first fruits.

* *Teriam*, to wit, *Terminia*, for preferring of trees planted, and corne sowne: or as some reade (*Teritium*) meaning *Terminus*.

CHAP.

¶ *Of Iugerum, and Actus. Of the antient Lawes ordained for Cattell in old time. How often and at what time Corne and victuals were exceeding cheape at Rome. What noble and famous persons addicted themselves wholly to Husbandrie and Tillage.*

AN Acre or Arpen of ground, called in Latine Iugerum, was as much as might be eared vp or ploughed in one day with a yoke of Oxen. And Actus in Latine is a Land, or so much just as two Oxen are driuen and occupied in, whiles they plough in one tract without any rest. This contained by the old time, 120 foot in length: and being doubled in length, made the Acre or Iugerum abovesaid.

In antient time of the old Romans, the greatest Present that could be giuen to captains and souldiers who had borne themselves valiantly in the seruice of their countrey, was as much ground as they could have eared or broken vp in one day. And it was thought a great reward to receiue at the hands of the people of Rome halfe a pint (or a pint at the vtmost) of corn. Moreover, in so great request was corn and Husbandry, that the first and chiefe houses in Rome, took their syrnames from thence: and namely, the *Pilumni*, who deuised first the pestill to bray corne withall in their mills and backhouses: also, the family of the *Pisenes*, who tooke their name, a *pisendo*, [i. of stamping or pounding corne in a mortar.] The *Faby* in like manner, the *Lentuli*, and the *Cicerones*, each one according to the feuerall pulse that they skilled best to set or sow. Moreover, to the house of the *Iunij*, they gaue the syrname of *Bubulcus*, by occasion of one of their ancestors, who knew passing well how to vse and order oxen.ouer & besides all this, that you may know what regard was had of corn, among other sacred and holy ceremonies, there was nothing reputed more religious than the bond of Consecration, in knitting vp of mariages, & assurance making of the chiefe priests: yea, the manner of the new wedded brides was to carry openly before them a wheaten cake. In times past the Magistrates called Censors, iudged it a trespassse worthy of great rebuke, to be an ill husband; that is to say, to be careless and negligent in tilling the ground. And as *Cato* reporteth, if men called one by the name of a good husbandman, they were thought to haue praised & commended him in the highest degree: hereupon also it came, that rich and substantiall men were termed in Latine, *Locupletes*, as one would say, *Loci-pleni*, [i. wel landed.] And as for the very word *Pecunia* in Latine, which signifieth money, it took the name of *Pecus*, (i. cattell). And euen at this day (as appeareth in the Registers of the Censors, and the accounts of the oity Chamber) all their rents, reuenues, and customes growing vnto the people of Rome, are called *Pascua*; for that a long time the whole domaine of Rome, stood vpon pasturage and nothing els. The penalties and fines also, which offenders were put to pay, were raised of nothing else but of Kine, Oxen, and Sheep: where, by the way, I cannot conceale from you the fauorable regard that the antient lawes and ordinances of Rome had; whereby it was expressly forbidden, That no Iudge who had power to enioine or impose any paine and amercement, should name the fine of an Oxe, vnlesse he had passed that of a Sheep first. The solemne games and plaies also in the honour of Kine and oxen, they who frequented them, called *Bubetij*. Moreover, king *Seruius* at the first when hee made brazen coine, stamped the peeces with the portraiture of Sheepe, Kine, and Oxen. By the lawes of the twelue Tables, all persons whatsoeuer aboue foureteen yeares of age, were forbidden vnder paine of death, either by stealth, to feed their cattell in the night time vpon any corn-field of another mans, ploughed and sown; or to cut the same downe by syth or sickle at such a time, and in that manner. By the same laws also ordained it was, That whosoever was attaint or conuicted thereupon, should be hanged by the head and strangled for satisfaction of the goddessse *Ceres*: and in one word, to be more grievously punished than in case of man-slaughter. But if the offender were vnder that age before-said, the same law provided, that hee should be whipped at the discretion of the Pretor or Lord chiefe Iustice for the time being: or, if this punishment were remitted by the partie who sustained the damage, then hee should satisfie vnto him for the trespassse as a slave, and pay double for the losse, according as honest and indifferent men valued it. Furthermore, in antient time, the distinction of States and degrees in the city of Rome (both for wealth and worship) was according to their lands, and not otherwise. In so much, as those citizens were reputed for chiefe and principall, who were possessed of Land and liuing in the Countrey: and these made the State, called the Rusticke Tribes, in Rome: whereas contrariwise the other estate, reputed the

A the meaner in degree, was named the Vrbane Tribes; consisting of Artisans and such like as were not landed persons: into which, if a man were transferred from any of the rest, it was thought a great shame and disgrace, as if he were reproched for idleness & negligence in husbandry. And hereupon these foure Tribes alone took name of those foure principall parts or quarters of the city wherein they were seated, to wit, Suburrana, Palatina, Collina, and Esquilina. ouer and besides, vpon faires and market daies, the Rustick Tribes vsually visited the city: vpon which daies therefore no publick assemblies of the people were holden, to call the Commons away from their market affaires. Also the manner in those daies was to take their sleepe and repose in good straw and litter. Yea, and when speech was of glory and renowne, men would call it by no other term but *Adorea*, of *Ador*, a kind of fine red wheat. Where, by the way, I haue

B in great admiration the antique words of those times, and it doth me good to think how significant they were. For thus we read in the sacred Pontificall Commentaries of the high priests, *For the Augurie or solemne sacrifice called * Canarium, let there be certain daies appointed, to wit, before the corn shew care out of the hofe, yea, and before th at it come into it.* But to return againe to the praise of Husbandry. When the world was thus addicted and giuen to Agriculture, Italy was not only well provided and sufficiently furnished of corne, without any help from out provinces; but also all kind of grain and victuals were in those daies so exceeding cheape, as it is incredible: for *Manius Martius* a Plebeian Edile of Rome, was the first man that serued the people wheat at one Assle the Modius: and after him *Minutius Augurinus*, the eleuenth Tribune of the commons (euen he who indited that mutinous and seditious citizen *Sp. Melius*) brought down the price of wheat for 3 market daies to an Assle the Modius. The people therefore of Rome, in regard of this good deed of his, erected a statue for him without the gate Trigemina; and that with such affection and deuotion, that every man contributed somewhat thereto by way of beneuolence. *Trebius* also in the time of his Edileship, caused wheat to be sold vnto the people at the same rate, to wit, one Assle a Modius. For which cause, there were 2 statues also in memorial of him set vp, both in the Capitoll and also in Palatium: and himselfe when he was departed this life, had this honor done vnto him by the people; at his exequies, as to be carried on their shoulders to his funerall fire. It is reported moreover, That in the very same yeare wherein the great goddessse *Cybele* (called also the mother of the gods) was brought to Rome, there was a more plentifull harvest that Summer, and corn was at a lower price than had bin known in ten yeares before. Likewise, *M. Varro* hath left in writing, That when *L. Metellus* made shew of so many Elephants in his triumph at Rome, a Modius of good red wheat, was worth no more than one Assle; also a gallon of wine cost no more. And as for drie figges, thirty pound weight carried no higher price: and a man might haue bought a pound of Oile olue, and 12 pound of flesh at the very same reckoning. And yet all this plenty and cheapnesse proceeded not from the great domaines and large possessions of those priuate persons that incroched vpon their neighbors, and hemmed them within narrow compasse. For by the law published by *Stolo Licinius*, provided it was, that no Roman citizen should hold in priuat aboue fise hundred acres. The rigor of which law or statute was extended and practised vpon the Law-maker himselfe, and by vertue thereof he was condemned: who, for to possesse aboue that proportion, and to defraud the meaning of the said Act, purchased more lands in the name of his Son. Loewhat might be the proportion and measure of possessions allowed euen then, when as the State and Common-wealth of Rome was in the prime and began to flourish. And as for the Oration verily of *Manius Curius* after such triumphs of his, and when he had subdued and brought vnder the obeisance of the Roman Empire and laid to their dominion so many forein nations; what it was, euery man knoweth, wherein he deliuered this speech, That he was not to be counted a good man, but a dangerous citizen, who could not content himselfe with a close of seuen acres of ground. And to say a truth, after that the kings were banished out of Rome, and their regiment abolished, this was the very proportion of land assigned to a Roman Commoner. If this be so, What might be the cause of so great plenty & abundance aforesaid in those daies: Certes, this & nothing els, great L.L. and generals of the field (as it should seem) tilled themselves their ground with their own hands: & the Earth again for her part, taking no small pleasure (as it were) to be eared and broken vp with ploughes Laureat, and ploughmen Triumphant, strained her selfe to yeeld increase to the vttermost. Like it is also, that these braue men and worthy personages were as curious in sowing a ground with corne, as in ordinance of a battell in array: as diligent (I say) in disposing and ordering

ring of their lands, as in pitching of a field: and commonly every thing that commeth vnder good hands, the more neat and cleane that the vsage thereof is, and the greater paines that is taken about it, the better it thriueth and prospereth afterwards. What shall we say more? was not [C. *Attilius*] *Serranus* (when the honorable dignity of Consulship was presented vnto him, with commission to conduct the Roman army) found sowing his own field and planting trees, whereupon he took that surname *Serranus*? As for *Quintius Cincinnatus*, a purveyor or messenger of the Senat brought vnto him the letters patents of his Dictatorship, at what time as he was in proper person ploughing a piece of ground of his owne, containing foure acres and no more, which are now called *Prata Quintiana*, [i. *Quintius* his medowes] lying within the Vatican: and (as it is reported) not onely bare-headed was hee and open breasted, but also all naked and full of dust. The foresaid officer or sergeant taking him in this maner, Do on your cloths sir (quoth he) and couer your body, that I may deliuer vnto you the charge that I haue from the Senate and people of Rome. Where, note by the way, that such Purveyors and Sergeants in those daies were named *Viatores*; for that eftsoones they were sent to fetch both Senatours and Generall captaines out of the fields where they were at worke: but now, see how the times be changed! They that doe this businesse in the field, what are they but bond-slaues fettered, condemned malefactors manacled, and in one word, noted persons, and such as are branded and marked in their visage with an hot yron? Howbeit the Earth, whom wee call our Mother, and whom wee would seem to worship, is not so deafe and fencelesse, but the knoweth well enough how shee is by them deprived of that honour which was done in old time vnto her: in so much, as wee may well weete, that against her will shee yeeldeth fruit as shee doth; how soeuer wee would haue it thought, by these glorious titles giuen vnto her, that shee is nothing displeased therewith, namely, to be labored and wrought by such vile and base hirelings. But we forsooth do maruell, that the labor of these contemptible bondslaues and abiect villains doth not render the like profit, as that trauell in former times of great captains and LL. Generalls. And in very truth, euen among other forrein nations, it was counted a princelike profession indeed, to be able for to giue rules and directions about Husbandry: for so we may see, that both kings haue studied this argument, as namely, *Hiero*, *Philometor*, *Attalus*, and *Archelaus*: and also martiall captaines; to wit, *Xenophon*, and *Mago* the Carthaginian. As for *Mago* verily, our Senate did him that honour after Carthage was woon, that in sacking it and giuing away among diuers LL. of Affricke, the Libraries there found; they thought good to referue only 28 volumes of his, and penned by him as touching Agriculture, and io haue them translated into the Latin tongue (notwithstanding that *M. Cato* had already beforetime put out in writing and set forth certaine rules & precepts therof) giuing order for this translation, to those that were well seene in the Punicke or Carthaginian language: in which businesse, *D. Syllanus* a Romane gentleman of a right worshipfull house, went beyond all others. As for great schollers and men of profound and deep learning, a number there were besides that trauelled in this matter, whom wee haue named already in the forefront; and eftsoones shall mention in the discourse of this volume. In which range we must nominate not vnthankfully among the meanest writers, *M. Varro*, who being fourescore yeares old and one, thought it not amisse to compile a speciall booke and treatise of Husbandry.

CHAP. III.

¶ The manner of Husbandry in ancient time.

Late it was ere the Romans began to set their minds vpon Vines and Vineyards: for at first they tilled only corne fields for very necessitie, euen as much as might suffice to serue the city. The order and manner whereof, I will set in hand to treat of; not after a vulgar and common sort, but according to my vsuall manner hitherto more soundly: as hauing sought out with all care and diligence, not onely the ancient practise in times past, but the inuentions also of late daies; & withall searched into the causes and reasons of every thing, and found them out. My purpose is besides, to speake in this treatise of the fixed Starrs; their rising and setting, M their apparition and occultation, together with their influences, as they are vndoubtedly obserued and seen here vpon earth. And this, my meaning is to do after a plain and familiar sort, forasmuch as they, who hitherto wrote of this argument, haue handled the same so subtilly, and penned

A penned it with so high a stile, as they may seeme to any man for to haue written books for Oratours to read, rather than to the capacity of plaine husbandmen for to practise. First and foremost therefore, I will for the most part deale by Oracles, that is to say, sententious Sawes, for to determine this question in hand: concerning which, there are as many to be found in number, and those as true in effect, as in any other part and profession of this our life whatsoeuer. And least any man should thinke it strange, that I call these rules of Husbandrie, Oracles; who would take them for lesse considering how they proceed from Time, a god most certaine, and are deliuered and approoued by Experience, the truest prophet of all others. And beginne I will with *Cato* first.

CHAP. V.

B ¶ The praise and commendation of Husbandmen: what things are to be required in the purchasing or taking to ferme of horse and land.

The children (saith *Cato*) that are begotten by husbandmen, proue most valiant, the hardest souldiers, and such as thinke least harme of all others. In buying of land, take heed you be not too hot and eager vpon the purchase. In the husbanding of ground, spare for no paine and trauell; but in the purchasing thereof be you nothing forward: a thing ouer-bought, hath euer more repentance, and had I wist, attending vpon it. They that are about a purchase, ought about all, to see how the ground is watered, what waies and auenues be about it, and what neighbors be neare vnto it. Out of every one of these points, matters of great importance and deepe conclusions may be picked, and those most certaine and infallible. *Cato* addeth moreover and saith, That there would be good regard had of the people conuining, and other grounds bounding thereupon, whether they be well liking, faire, and trim to see vnto? For these be his words, It is a good signe (quoth he) that the ferme is well seated and in a commodious quarter, if all about looke well. *Attilius Regulus* (hee who during the first Punicke warre was twice Consul of Rome) was wont to say, That a man should not purchase an vnwholesome piece of land, were it neuer so rich and fruitful, nor make choice of a barren soile, were it neuer so healthie. Now as touching the healthfulness of a place, a man may not alwaies conclude thereof by the color and fresh hue of the inhabitants: for many times it falleth out, that those who be vsed to pestilent places, hold out well and haue their health; yea and by their looks bewray no harme that they take. Moreover, some quarters and coasts there be, which at some times of the yeare stand found and healthy enough; but I will count none holisome, but such as be healthfull all the yere long. An ill piece of land is that, which putteth the lord thereof to pain, and with which he is forced to wrestle for to haue his health. *Cato* would haue this point especially to be considered, that the soile of a ferme (scitnat as hath bin said) be good of it selfe, and fertile: also, that neere vnto it there be store of laborers: and that it bee not farr from a good and strong towne: moreover, that it hath sufficient meanes for transporting of the commodities which it yeeldeth, either by vessels vpon water, or otherwise by waies vpon the land. Furthermore, that the manour house be well built, and the land about it as well husbanded. Howbeit, herein I see many men to erre much, and greatly to be deceived: for they hold opinion, that the negligence and ill husbandry of the former lord, is good for him that shall purchase land and come after him. But I say, there is nothing more dangerous and disadvantageous to the buyer, than land so left wast and out of heart: and therefore *Cato* giueth good counsell, to purchase land of a good husband, and not rashly and hand over head to despise and set light by the skill and knowledge of another. Who saith moreover, That as well land as men (which are of great charge and expence) how gainfull soeuer they may seeme to be, yeeld not much profit in the end to the master declarer, when all counts be cast and reckonings made. He therefore judgeth, that the Vine yeeldeth the best reuenue, of all commodities belonging to a ferme: and good reason he hath so to say, because about all things he taketh order to cut off expence as much as may be. Next to it, he reckoneth Hort-yards, such especially as haue water at command: and good cause why, provided alwaies that they lie vnder a good towne side. [In the third place he rangeth the Olive plets, and after them Olive reues:] then he counteth of medows, which our ancestors called *Parata*, as a man would say, Ready and provided. The same *Cato* being asked, What was the most assured profit rising out of land made this answer, To feed Cattel well: being asked againe, What was the next? *Cato* (quoth hee) to feed in a meane. By which answers he would seeme to conclude, That the

most certain and sure reuenue was that, which would cost least. Howbeit, this is not so general a rule, but it may alter according to the diuersitie of places, & sundry occasions occurrent. Herunto also is to be referred another speech of his, That a good husbandman ought to be a seller, [and not a buyer:] as also, That a man should make speed in his youth, and not delay to plant and stocke his ground; but not to build thereupon, before it be well and thoroughly stored that way: and euen then also, he should not be forward thereto, but take leisure ere he be a builder: for it is the best thing in the world (according to the common prouerbe) To make vse and reap profit of other mens follies: provided alwaies, that a mans land be not ouer-built, lest the experience of keeping all in good repaire, be chargeable and burdensome. Now when there is a sufficient and competent house builded thereupon, a good husband will vse to repaire often thereunto, and take pleasure so to do: and verily a true saying it is, That the lords eie is far better for the land, than his heele.

C H A P. VI.

¶ How to chuse a convenient place for to build a manour house in the country. Also certain rules obserued in ancient time, as touching Husbandrie and tilling ground.

IN building vpon a mans land, this mean and moderation is commended, That the house be answerable in proportion to the ground: for as it is a bad sight to see a large domain and circuit of ground without a sufficient graunge or home-stal to it; so it is as great a folly to ouer-build the same, & to make a faire house where there is not land enough lying to it. Like as there were two men at one time liuing, who faulted diuersly in this behalfe; to wit, *L. Lucullus* and *Q. Scauola*, for the one was possessed of faire lands without competent building thereto, whereas *Lucullus* contrariwise built a goodly house in the country, with little or no liuing adjoyning to it: in which regard, checked he was by the Censors, for sweeping more floures than he ploughed lands. Now in building, there would be art and cunning shewed: for euen of late daies *C. Marius* (who had bin seuen times Confull of Rome) was the last man that built an house within the territory of the cape Misenum, and he seated it so, as if he had pitched & fortified a camp right skilfully; in such sort, that when *Sylla* (named *Felix* [i. Happy]) saw his manner of building, he gaue out and said, That all the rest in comparifon of him, were blind beetles, and knew neither how to build nor to encamp. Well then, a house in the country would be set neither neere vnto a fenny and doimant water, ne yet ouer-against the course and stream of a running riuier; and yet what faith *Homer* besides to this purpose? The aire and mists (quoth he, and that right truly) arising from a great riuier betimes in a morning before day-light, cannot chuse but be euer cold and vnholosome. How then? may if the country or climat be hot, an house must stand into the North; but in case the quarter be cold, it ought to affront the South: if the tract be temperate between both, it should lie open vpon the East point, where the Sun riseth at the *Æquinoxes*.

As touching the goodness of the soile, and namely what signes and marks there be of it; although I may seem to haue sufficiently spoken already, in the discourse which I had of the best kind of ground, yet I am content to subscribe to other tokens thereof deliuered by other men, and especially by *Cato* in these words following: *When you see* (quoth hee) *growing vpon any land,* [store of *Walwort*, *Skeg* trees, *Brambles*, the little wild *Bulbous* *Crow-toes*, [called other wise our Ladies *Cowslips*] *Chauer-grasse* or *Trifule*, *Melilot*, *Oke*, wilde *Pyrries*, and *Crab-trees*: know ye, that these doe shew a ground good for *Wheat*, and such like white-corne. So doth also the blacke mould and that of a fleshe colour, testifie no lesse. Where there is store of chalke or plaister, the ground is not so fit for corne; for all kinde of chalke doth heat ouermuch, vnlesse the same be very leane. The like doth stand also, if it be not passing fine and small. And the effects abovesaid are much more seen in the plaines and champaine vallies, than vpon the hills and mountaines. Our ancestors in old time thought it a principall point of Husbandrie, not to haue ouermuch ground about one graunge: for they supposed more profit grew by sowing lesse, and tilling it better: of which mind I perceiue *Virgil* was. And to say a truth, confesse we must needs, That these large enclosures and great domains held by priuat persons, haue long since bin the ruine of *Italie*, and of late daies haue vndone the provinces also thereto belonging. Six Land-lords there were and no more, that possessed the one moitie of all *Africke*, at what time as the Emperour *Nero* defeated and

* *Laudato in-
gentia vray,
Exiguum coli-
ta*

A and put them to death. Where, by the way, I may not defraud *Cn. Pompeius* of the due glory answerable to that greatnesse of his, who neuer in all his life would purchase any ground that bordered vpon his owne land. *Mago* thought it no reason, but a very vngentle and vnkind part for the buying of land, to sell a mansion house; and in his conceit, it preiudiced much the weale-publick. And verily this was the principall point that he recommended in the entrance of his treatise and rules set downe for Husbandrie, so as a man might perceiue very euidently, that hee required continuall residence vpon the land. Next to these principles aboue named, great regard would be had in chusing of good & skilful bayliffs of the husbandry, concerning whom *Cato* hath giuen many rules. For mine own part, it shal suffice to say thus much only, that the lord ought to loue his bayliffe very well, & set him next to his heart: but himself should not let him know so much. Moreover, I hold it the worst thing that is, to set slaues & condemned persons in their gynes & chains, about tilling and husbanding of a ferme: neither do I like of any thing don by such forlorne and hopelesse persons; for lightly nothing thrives vnder their hand. I would put down one saying more of our ancient forefathers, but that haply it may seeme a fond & rash speech, yea and altogether incredible, & that is this, *Nothing is lesse profitable, & expedient, than to labor a ground exceeding much, and to ouer-till it.* *L. Rarius Rufus*, a man of very bafe and low parentage descended, & yet aduanced to the Consular dignity for his prowesse in feats of arms; was otherwise very thrifty and sparing, after the maner of the old world; inso much as partly by his niggardise and partly through the liberality of *Augustus Caesar*, he had gathered good together amounting to the sum of an hundred millions of Sesterces: all which masse of money, **C** what with purchasing land to land in the Picene country, and what with bestowing such a deale of husbandry vpon it, more ywis of a vain glory and ostentation, than for any profit that he reaped thereby, he laid forth and spent euery whit of that stock; inso much as hardly he could finde any man that would take vpon him to be his executor, or to accept simply of the inheritance. What shall we say then? or what good commeth of such houses or lands so chargeable, as that they are like to cost a man his life, and that by famine? I hold therefore, that in all things a mean is best, and bringeth greatest profit in the end. To till and husband ground well, is necessary; to ouer-do the same and to exceed, turneth more to the damage than the profit of the lord, vnlesse it were done by his own children, or to maintain the charge of keeping such hinds as otherwise must be found if they sat still and did nothing: for setting that cause aside, it falleth out oftentimes, that the gathering and inning of some harvest (if a man count all the pains employed and the mony of the purse) is nothing beneficial to the master. In like maner, Oliues would not alwaies be tended and looked vnto ouermuch: neither do some grounds require much diligence, but are the worse for such attendance: as may be seen (by report) in *Sicily*; which is the cause that new commers thither for to be tenants, and to occupy those lands, are many times deceived and put besides their reckoning.

After what manner then shall we proceed in the husbandry of our land to most benefit and behoofe? Learn a rule out of the Oracle or sententious riddle, which goeth in this forme, *Malis bonis* [i. Cheapest, Best.] But herein, me thinks, good reason it is, that our old great grandfathers should be defended and excused for holding these strange and obscure paradoxes; they (I say) who by such rules and precepts, tooke great care and paines to instruct vs how to liue. Would you know then what they meant by this word *Malis*? surely they vnderstood, those that were cheapest and stood them in least. The chiefe point of all their prouidence and foresight, was to goe the nearest way to worke, and to be at the smallest cost: and no maruell; for who were they that gaue out these thrifite precepts? euen those, who reproched a victorious General (and one who triumphed ouer the enemy) for hauing a cupboard of siluer plate weighing but ten pound: those (I say) who if their bayliffes of husbandrie chanced to die, whereby their lands in the countrey stood void, would make suit to be gone themselves thither, and to return to their own fermes; leaving behind them the glory of all their victories by them atchieued: and to conclude, euen those who whiles they were imploied in the conduct of armies, had their grounds **F** looked vnto and tilled at the charges of the common-weale, and had no other for their bayliffes than the noble Senators of Rome. From their mouths came these other oracles and wise sentences following: An ill husband is he, who is forced to buy that, which his ferme might afford him. As bad is that housholder & master of a family, who doth that in the day which might be don by night, vnlesse vnseasonable weather driue him to it: worse than either of these is he, who

doth that vpon work-daies which should haue bin done on play daies or idle holidiaes: but the worst of all other is he, who when the weather is fair, will chuse to work rather within close house than abroad in the open field: & here I cannot hold and rule my selfe, but I must needs alledge one example out of ancient histories, whereby it may be vnderstood, How it was an ordinary matter to commensate actions and to maintaine pleas in open court before the body of the people in the case of Husbandry: as also in what sort those good Husbandmen of old timewere wont to defend their owne cause when they were brought into question. And this was the case. There was one *C. Furius Crepinus*, late a bond-slave, and newly enfranchised, who after that hee was set at liberty, purchased a very little piece of ground, out of which he gathered much more commodity than all his neighbors about him out of their great and large possessions: whereupon he grew to be greatly enuied and hated; inso much, as they charged him with indiret means, as if he had vsed forcery, and by charmes and witch-craft drawne into his owne ground that increase of fruits, which should otherwise haue growne in his neighbors fields. Thus vpon complaint and information giuen, he was presented and indited, by *Spurius Albinus*, an *Edile Curule* for the time being: and a day was set him down peremptorily for his personal appearance to answer the matter. He therefore fearing the worst, and doubting that he should be cast to pay some grievous fine; at what time as the Tribes were ready to giue their voices, either to acquit or condemne him, brought into the common place his plough, with other instruments and furniture belonging to husbandry: he presented likewise in the open face of the court, his owne daughter, a lusty strong lassie and big of bone; yea, and (as *Piso* telleth the tale) well fed, and as well clad: he shewed there (I say) his tooles and plough yrons of the best making, and kept in as good order; maine and heauy coulters, strong and tough spades, massie and weighty plough-shares, and withall his draught Oxen, full and faire. Now, when his course came to plead his owne cause before the people, and to answer for himselfe, thus he began and said: My masters (quoth he) you that are citizens of Rome, behold, these are the forceries, charmes, and all the enchantments that I vse (pointing to his daughter, his oxen & furniture abouenamed:) I might besides (quoth he) alledge mine owne traueil and toyle that I take, the early rising and late sitting vp so ordinary with me, the carefull watching that I vsually abide, and the painefull sweats which I daily indure; but I am not able to represent these to your view, nor to bring them hither with me into this assembly. The people no sooner hard this plea of his, but with one voice they all acquit him and declared him vnguiltly, without any contradiction. By which example verily, a man may soone see, that good husbandrie goeth not all by much expence; but it is pains taking and careful diligence that doth the deed. And hereupon came the old sayd saw, so rise in euerie mans mouth, that the only thing to make ground most fertile and fruitfull, is the Masters eie. As for all other rules and precepts of Agriculture, respectiue to this or that peculiar point of husbandry, I will deliuer them in their proper places accordingly. And in the meane time I will not omit such as be more generall, as they shal come into my mind and remembrance. First and formost, there offereth it selfe to me one about the rest, whereof *Cato* is the Author, and which of all others I hold to be most profitable and founding to ciuilitie; to wit, that in all our doings we aime at this, To haue the loue and good will of our neighbors: and that for many and sufficient reasons by him alledged, which I suppose no man will make any doubt of. *Imprimis*, hee giueth a good caueat, That our seruitors and people about vs be not surewd, but well ordered, and that none of our family be ill disposed to offer any wrong. *Item*, All good husbands agree in this, that nothing would be done too late and when the time is ouerhipt. And againe, That euery worke should haue the due and conuenient season: to the same effect there is a third admonition, namely, That when the opportunity is once past, in vaine we seek to recall and recover it. As touching a rotten and putrified ground, we haue at large shewed already how much *Cato* doth abhor and curse it. And yet he ceaseth not to forewarne vs of it, and besides, to giue vs these rules following. What work soeuer may be performed by a poore Asse, is thought to cost little or nothing, and to be done very cheape. Ferne or Brake will die at the root in two yeares, if you wil not suffer it to branch and grow aboue ground: and this shall you hinder most effectually, in case you knap off the head of the first spring with a wand or walking staffe: for the liquid iuice dropping downe from them, doth kill the root. It is commonly said also, that if they be pulled vp about the summer Sun-stead, they will not come againe but die: as also, if they be topt, or their heads whipt off with a reed: or if they be eared vp with the plough, so as there be a reed fastned to the share.

A share. Semblably, for to kill reeds, they giue order to plough them vp, with some Fern likewise laid vpon the share. A rushe ground must be broken vp and turned ouer & ouer with the broad spade: but if it be stony, it would be digged with a mattock or two tined fork. Rough grounds and giuen to beare shrubs, if a man would stork, the best way is to burne them vp by the roots. If the place lie low, and be ouermoist, the onely meane to make it sound and drie, is to draine away the water by trenching. In case a ground doe stand vpon chalke or plaister, the ditches or trenches therin should be left wide open: but if the soile be more loose & not so fast, they must be strengthened and kept vp with quick-set hedges, for feare of falling: or else they ought to be made in such sort, as both the sides thereof be well bedded and couched, bearing out a belly a slope, and not digged plum downe-right. Some would be closed vp aboue and made very strait and narrow, for to run directly into others that are more wide and large: also, if occasion doe so require, the bottome of their channell would be paved with pebble, or laied with good grauell. As for the mouth and end thereof (to wit, for entrance and issue) they ought both of them to be fortified and vnderfet with two stones at either side, and a third laied crosse ouer them. Last of all, if a ground run to wood and be ouergrowne therewith, *Democritus* hath taught vs the means how to kill the same in this manner, Take Lupine floures, let them be steeped one whole day in the iuice of Hemlock, and therewith besprinkle and drench the roots of the shrubs that ouer-run the place, and they will die.

CHAP. VII.

¶ Sundry sorts of corne, and their severall natures.

C Now that we haue thus shewed the way how to prepare a field for to beare corne, it remaineth to declare the nature of corne. And to speake generally of all graine, there are two principall kinds thereof; to wit, first Fourment, containing vnder it wheat and Barley, and such like: secondly, Pulse, comprising Beans, Pease, Chiches, &c. The difference obserued both in the one sort and the other, is so euident and plaine, that needlesse it is for me to vse any words thereof. And as for the former kind called Fourment, it is diuided also into sundry sorts, according to the severall seasons wherein they be sowne. First there is the Winter corn, which being sowed about the setting of the star Virgilia, i. in Nouember, lieth all winter long in the ground and there is nourished, as for example, Wheat, Rie, and barley. Secondly, Summer corne, which is put into the earth in Summer about the rising of the foresaid star Virgilia, i. The Brood-hen, to wit, in May; namely, Miller, Panick, Horminum, and Irio (two kinds of grain.) But note that I speak here of the manner vsed in Italy. For otherwise in Greece and Asia, they sow all indifferently at the retreat or occultation of Virgilia: and to come againe to our Italy, some grain there is which is sown there, both in Winter and Summer: as also, you shall haue other corne sowed in a third season; to wit, in the Spring. Some there be who take for Spring-corn, Miller, Panick, Lentils, eich Pease, and the grain whereof * Fourmenty is made. But Wheat, Barley, Beans, Nawes, Turneps, and Rapes, they hold for Sementina, i. to be sowed at the proper and timely season of seed, in Autumne. In that kind of corne which comprehendeth Wheat, there is to be reckoned that grain which serueth for prouender and forrage, and is sown for beasts, & namely, that which they call dradge or ballimong. Likewise, in the other kind, to wit, of Pulse, the Vetches be comprised: but that which is good indifferently both for man and beast, is the Lupine. All sorts of Pulse called in Latine Legumina, vnlesse it be the Bean, haue but one root apiece, and such be as hard as wood, and full of shoots, and those diuided into forked branches: and the roots of the eich Pease run deepest into the ground. But all other corne vnder the name of Frument, haue many small fillers or strings appendant to the roots & otherwise branch not: as for Barley, whichereth and begins to shew within 7 daies after it is first sowne. All sorts of Pulse appeare aboue ground by the fourth day or the fifth at the vtmost. And yet Beans ordinarily do lie in the ground 15 or 20 daies. Howsoeuer in Egypt all Pulse commeth vp by the third day. In Barley one end of the seed runneth to root downward, and the other into blade, and that * bloometh first. Now, if you would know which end serueth for the one and the other; certaine it is, that the bigger and thicker part of the grain yeeldeth root, and the smaller the greene blade. In all other seeds there is no such diuersitie, for from one and the same end breaketh out both root and greene blade. All kind of corn carying spike or eare, called Frumenta, shew nothing but the green blade during winter: howbeit, no sooner commeth the spring, but they begin to grow vp

Bbb 3

into

* No maruell being sowed before winter.

into straw, and to spindle vppward pointwise, I meane all that be of the winter kind. But Millet and Panick run vp into an hollow item full of knots and ioynts: and Sefama by it self into a kex or hollow stem in maner of fenell and such like. The fruit or seed of all graine that is sowne or set, is contained within eares, as we see in (bearded) wheat and barley, and the same is defended as it were with a palisade of eales, disposed square in foure ranks; or is inclosed within long cods and husks, as the Pulse kind, or els lieth in little cups, as Sefame and Poppie. Millet and Panick only put forth their fruit grape-wise and openly, without any partitions and defences, so as their seed is exposed to the little birds of the aire: for no otherwise are they defended, than within small skins and thin husks. And as for Panick, it taketh the name of certain panicles or chats hanging from the top thereof, whereby the head bendeth and leaneth downward, as if it were weake and wearie of the burden. The stem or stalk thereof groweth smaller and smaller, and pointed vppward: in so much as by little and little it runneth vp in maner of a little sprig, or sion, and there you shall see a number of seeds or grains clustered together thicke, in so much as they are sometimes bunched with an head a good foot long. As touching the Millet, the head thereof bearing seed round about is bent likewise and curbed, beset also with fringes, as it were, of hairy fillets. But to return to Panick againe, there be sundry sorts thereof: for some of it is found with a tuft or bunch, from which depend certain small clustered chats or panicles, & the same also hath two knaps or heads, and this is called Mammofum, as one would say, the Panick with bigs or dugs. Moreouer, you shall haue Panick seed of sundry colours, white, blacke, and red, yea and purple. Of Mill or Millet there be diuers sorts of bread made in many places; but of panick it is not so common: howbeit there is no grain more ponderous and weighty than it, or which in the seething or baking swelleth and riseth more; for, out of one Modius or pecke thereof there is ordinarily made 60 pound of dough for bread. Moreouer, take but 3 sextares or quarts of it being steeped, and it will yeeld a measure called Modius, of thicke gruel or batter, called in Latine Puls. It is not fully ten yeres since there was a kind of * Millet brought out of India into Italy, and the same was of colour black, the seed or grain in quantitie big and faire, and for stem like vnto a reed. It riseth vp in height seven foot: the stalks are mighty and good, some call them Lobæ or Phobæ. Of all sorts of corne it is most fruitfull, and yeeldeth greatest increase: for of one grain a man shall haue 3 sextars or quarts again. But it loueth, yea & ought to be sown in a moist soile.

* Turkish Millet.

Moreouer, some kinds of spiked corn begin to spindle and gather eare at the third ioynt, others at the fourth: but there it lieth as yet hidden and inclosed. Now as touching these jointed wheat beareth usually foure, beere Barly six, and the common sprit Barly eight, which is well to be considered: for no corn vseth to spier before it be fully knotted or iointed in maner abovesaid. And so soon as the said spier sheweth some hope of an eare, within 4 or five daies after at the most, they begin to bloum: and in as many dayes space, or little more, they will haue done and shed their floures. And yet I must needs say, that all sorts of barley are a seven night at the vtmost in so doing. *Varro* saith, that in foure times 9 daies this kind of corn cometh to perfection: but it ought to stay nine moneths before it be ripe for to be reaped and mowne downe. As for Beanes, after they be set or cast into the ground, first they put forth leafe, and afterward stalk, that shooteth vp euen, without any partition of ioynts or knots between. All other pulse besides the Bean, haue a more folliid and woody substance in the straw. Of which, the Chich pease, the Ervile, and Lentils doe spread forth in branches. And some of them runne so low that they creep along the ground, vnlesse they be born vp and supported with some props, as for example Pease, which help if they misse they proue the worse for it. Of all manner of Pulse, the Bean alone and Lupine beare but one single stalke apiece: the rest doe branch into very small sprigs or tendrils. Howbeit none of them but their stalke or straw is fistulous and hollow in maner of reeds. Some pulse put out leaues presently from the root: others again from the top or head only: wheat and Barly both the one and the other: and what corn soeuer standeth vpon a stalk, beareth one leafe in the head or top thereof. But the leaues of Barly are rough, whereas in other corn they be smooth. Contrariwise, Beanes, Chiches, and Pease haue many leaues. In spiked corn the leafe resembleth that which groweth to reeds: in beans they be round, and so likewise in the most kinds of puls, howbeit in pease and Ervile we see they be somewhat longer. The leaues of Fafels or Kidney beanes are ribbed and full of veines: of Sefama and * Irio they be red and resemble blood. The Lupines only and the Poppies do shed their leaues. All pulse

* Turkish corne.

- A pulse is long in the bloom, and namely Ervile and the Chich pease: but Beanes continue longest, euen for the space of 40 daies together: howbeit euery single stalk beareth not bloom so long: but thus it is, as one hath done and giuen ouer, another beginneth a fresh. Neither bloumeth the whole field at once, as spiked corn doth. Also, all kinds of Pulse doe cod at sundrie times, and not vpon the same day: beginning first at the bottome, and so likewise the floure riseth vp higher by little and little. All come growing in spike or eare, so soone as it hath done blooming, waxeth big and strong, and cometh to maturitie within forty daies at the farthest: so doth Beanes also: but the Chich pease receiueh her full perfection in very few daies: for from the time that it was first sowed, it groweth to be ripe in forty daies. Millet, Panick, Sefame, and all Summer corn, haue their full ripenesse forty daies after their blooming. But herein there is great diuersitie, according to the clyme and the soile: in which respects corne ripeneth sooner or later. For in *Ægypt* Barley is readie to be reaped in the sixt moneth after it was sowne, and Wheat in seuen: but in the region of *Hellas* in *Greece*, the Barley tarieth seuen moneths; and in *Peloponnesus* or *Morea*, eight. As for wheat and such like hard corne, longer it is ere it be ripe and ready for the fycle. All Corne that groweth aloft vpon a stalke or straw, beareth the graines arranged spikewise, and as if they were plaited and braided like a border of haire. In Bean stalks and other such like pulse, the cods grow in alternatiue course, some on the right side, others on the left, in order. Wheat and such like spiked corne withstand the winter cold better than Pulse: but these yeeld a stronger food, and fill the belly sooner. Wheat, Rie, and such like grain are well wrapped within many tunicles. Barley for the most part lieth bare and naked: so doth *Arinca* [i. a kind of Rice or Amel corn] and Oats especially. The straw of wheat and Rie is commonly taller than that of Barly. But the eiles of Barley are more rough and prickie than those of the other. Pol-wheat both red and white, yea and Barley also, is threshed and driuen out of the husk vpon a floore, and being thus threshed clean and pure, it is either ground or sowne againe without any parching or drying in a furnace. Contrariwise, the Beare corne of Bearded wheat, Far, Millet, and Panick, cannot possibly be made clean, vnlesse they be first sendged and so dried. These sorts of graine therefore vse to be sowed raw and rude with their very husks: like as the Beare corn or bearded Far men are wont to keep still inclosed within the husk against seed time, and neuer parch or dry it at the fire. Of all the sorts of grain before rehearsed, Barley is the lightest; for a Modius or pecke thereof seldome weigheth about 15 pounds, whereas the like measure of Beanes posseth 22. The bearded corne Far is yet more ponderous than it; and Wheat more than all the rest. In *Ægypt* they vse to make certain frumentie meat or naked grotes of a kind of Rice or white Amel-corn, called *Olyra*, which is among them holden for the third sort of Spike-corne. In *Gaul* likewise they haue a kinde of frumentie corne or gurts by themselves, named in their language *Brance*, and with vs in Italy and about *Rome*, *Sandalum*: this grain is of all others most neat and faire, and this singular propertie it hath besides different from the rest. That ordinarily in euery measure called Modius, it yeeldeth more bread by foure pound weight than any other corne husked and dressed in maner aforesaid. *Varro* reporteth, That the people of *Rome* for 300 yeres together vfed no other meat than the grotes made of common Wheat. And as touching Wheat, there be many sorts thereof, distinguished by the names of the Regions and countries where they be found growing. Howbeit for my part I thinke verily, that there is no wheat in the world comparable to ours, here in Italy, for it surpasseth all others both in whitenesse and also in weight: by which two marks especially, as it is knowne from the rest, so it is reputed for the very best. And if you take the wheat growing in the mountain countries of Italy, the best haply of forreign regions may match it, and that is the wheat of *Beotia*: the principall of all others next to it, is that which grows in *Sicily*; and then that of *Africk* may be ranged in the last place: in a third rank is to be reckoned the *Thracian* and *Syrian* Wheat, and after them the *Ægyptian*, in regard of the weight that it carrieth. Now these degrees of weight we gather by the proportion assigned to champion and wrestlers, whose allowance was much like to the liurie giuen to laboring horses, and as much in manner would their paunches both require and receiue: for according as they could eate of the one sort more measures than of the other, * so arose these distinct degrees in the weight a horse said. The Greeks make great account of the Wheat growing by *Pontus*, and highly commend it: but this neuer came into Italy, neither know wee what it is. The same Grecians preferred before all other grain, these three sorts, to wit, *Dracontias*, *Strangias*, and *Selinusium*; esteeming

* For whereas of the Athenian Whcar, five demy Sextars, (i. two quarts and a halfe) were but sufficient, three would serue and content them of the Beotian (i. a quart & half: wherby it was collected, how much weightier this was than that.

ming the goodnesse of the corn by the thicknesse andignes of the straw, and attributing these three kinds by that signe and argument, to the goodnesse and riches of the soile: and therefore they prescribed to sow this corn in a fat and battle ground. But the lightest in weight and poorest in substance, because it required much nutriment, they appointed to be sowed in moist places. Of this opinion and iudgment were the ancient Greeks, during the reign of *Alexander the Great*, at what time as Greece was in the floure and height of her glory, as hauing the monarchie and soueraigntie ouer the whole world. Howbeit, before his death 145 yeares or thereabout, *Sophocles* the Poet in a Tragedie entituled *Triptolemus*, praised the Italian wheat about all other: for in effect thus he saith word for word;

Et fortunatam Italiam frumento canere candido.

And Italy, a land (I say) so happy and so blest,

Where stand the fields all hoare and gray with white Wheat of the best.

And in very truth our Italian wheat at this day carieth the name alone in that regard, I wonder therefore so much the more at the modern Greeks of late time, who made no mention at all of this our wheat. Now at this present, of all those kinds of outlandish wheat which are transported by sea into Italy, the lightest is that which commeth out of France and Chersonesus, [i.e. the streits of Callipolis] for a Modius or peck thereof containeth not about 20 pound weight, weigh the very graine it selfe as it groweth, vncleaned, huske and all. The Sardinian wheat is more weighty than it by halfe a pound in a Modius. And that of Alexandria exceedeth the French halfe a pound and * one third part, in euery measure before named. And this is the very poise also of the Sicilian wheat. The Beotian is yet a full pound heauier: and that of Africk as much, and * three fourth parts of a pound more. In Lombardy & that tract of Italy beyond the riuer Po, I know full well that a Modius of their wheat weighed 25 pounds; and about Clusium 26. But be the corne whatsoeuer it will, this is the ordinarie proportion by the course of Nature, that being made into down-right household bread for soldiers, and to serue the campe, it ought to weigh as much as it did in corne, and one third part ouer and aboue. As also this is a rule, That the best Wheat is that which to cuerie Modius will take and drink vp a gallon of water ere it be made dough. And yet some kindes of Wheat there be that will yeeld the full weight aforesaid in bread, and neuer count the water going thereto, & namely that which commeth out of the Balear Islands, for a Modius of that wheat yeeldeth in bread 30 pound weight: yet otherwhiles it falleth out in some kindes of wheat (being blended two sorts together, as namely that of Cyprus and Alexandria, whereof neither exceed little or nothing more than 20 pound weight to the Modius) that the bread made thereof will arise to the ordinarie proportion: for the Cyprian wheat is not bright, but brown and dusky, and therefore makes a blacke kind of bread; in which regard the Alexandrian wheat, which is faire and white, is mixed with it, and so both together do yeeld in bread 25 pound weight. The wheat of Thebes addeth a surplusage thereto of one pound.

As for the maner of working and kneading dough, I like not their fashions who take sea water for that purpose, as most do that inhabit the sea coasts, thinking thereby to saue the charge of salt; for I hold this very hurtfull and dangerous. Neither doe I thinke, that vpon any other cause mens bodies are made more subiect to maladies, than by this means. In France & Spain, when the Bruers haue sleept their wheat or frument in water, and masht it for their * drink of diuers sorts, as heretofore hath bin shewed; they take the * skum or froth that gathereth aloft by the working of the wort, and vse the same in stead of leuen for to make their bread, which is the reason that their bread is lighter and more houued vp than any other.

Moreover, there is great difference in wheat by reason of the straw or stalk that bears it: for the thicke or that it is and more full, the better is the corne taken to be. The Thracian wheat is inclosed and well clad (as it were) with many tunicles and coats; thoroughly provided by that means (and good cause why) to resist the excessive cold of that climate, which gaue the Thracians iust occasion also to cast about and deuise to haue a kind of wheat that remaineth vpon the ground not about three moneths, by reason that the snow ouerspreadeth the face of the earth all the yeare: besides: and verily this kinde of corne is come into other parts of the world, and lightly within three moneths after it is sowed, you shall haue it readie to bee reaped. A pra-

surmi.
* Yest or barm

A *As* well knowne all the Alpes ouer, and in other cold and winterly regions, where (by report of the inhabitants) this kind of corne doth wondrous well, and none prospereth better or groweth more ranke than it. Ouer and besides, there is another kind of wheat that putteth vp from euery root one stalk and no more in any place whatsoeuer: the manner is to sow it in no ground but that which is light, and it neuer misseth. Also about the Thracian gulf, there is wheat that within 40 daies after the sowing, will be ripe, and therupon it is called the Two-month wheat. And would you heare a wonder? there is no wheat more weighty than it, and besides it yeelds no branne at all. In Sicilie and Achaia both, there is great vse thereof, and namely among the mountainers of those two countries. Much seeking also there is after that corne in the Isle Euboea, about Carystus. See how much *Columella* was deceived, who thought that there was not to be found so much as any kind of three months wheat: whereas it is plaine, that such hath bene of old and time out of mind. The Greeks also haue a proper name for it, and call it *Trimenon*. Furthermore, it is reported, that in the countrey *Bactriana*, there is some corne of that bignes, that euery graine is full as much as one of the eares of ours.

But to returne againe to our husbandry; of all spiked corne, Barley is sowed first: but I purpose to set down the very iust time and season apropiat to each kind, according to the seuerall nature of euery sort, which my meaning also is to declare. Mean while I cannot omit, that there is among the Indians, barley both sowne and also wild, whereof they make the best bread that they haue. As for vs Italians (to say a truth) we set most store by rice, whereof (being husked and cleaned) we make grotes, like for all the world to those which other men besides doe make of barley husked. The leaues verily that this graine Rice doth beare, be pulpos and fleshy, resembling Porret or Leeks, but that they be broader: the stem groweth a cubit high, the floure is of purple colour, and the root round like a jem or pearle.

Barley [husked] was the most ancient meat in old time, as may appeare by the ordinarie custome of the Athenians (according to the testimonie of *Menander*) as also by the addition or surname giuen to sword-fencers, who vpon their allowance or pension giuen them in barley, were called *Hordearii*, [i.e. Barley-men.] The ordinarie drie grout or meale also *Polenta*, which the Greeks so highly commend, was made of nothing els but of barley: and the preparing thereof was after sundrie waies. The manner that the Greeks vsed, was first to steepe the barley in water, and giue it one nights drying, the morrow after they parched or fried it, and then ground it in a mill. Others there be, who (when it is well fried and parched hard) besprinkle it once againe with a little water, and then dry it before it be ground. There are some again, who take the ears of barley when they are green, beat & drie the corn out, and while it is fresh and new, cleanse it pure, which don, they infuse it in water, and while it is wet, bray it in a mortar: then, they wash it well in oser paniens, and so let the water run from it, and being dried in the sun, they pound or stamp it againe, and being thoroughly husked and cleaned, grind it into meale as is aforesaid. Now when it is thus prepared one way or other, to twenty pound of this barley they put of Line seed three pound, of Coriander seed halfe a pound, of salt about two * ounces and two drams: and after they haue parched them all well, they blend them together and grind them in a quern. They that would haue this meale to keep long, put vp into new earthen vessels altogether both floure and bran. But in Italy they neuer vse to steep or soke it in water, but presently parch it, and grind it smal into a fine meale, putting thereto the former ingredients, and the graine of Miller besides.

As for bread of Barley, so much vsed of our forefathers in old time, the posterity that liued after, found to be naught and condemned it: in such sort, as they allowed it for prouender only to feed their beasts and cattel with. But in stead thereof came vp the vse of * husked barley to be sodden for grewell; so highly commended as a most nutritiue and strong meat; and withal, passing wholesome for mans bodie: in so much as *Hippocrates* (who for skill and knowledge was the prince of all Physicians) hath written one whole booke in the praises onely of it. Now the best *Prisana* or husked barley, is that which commeth from *Vtica*. As for that which wee haue from *Egypt*, it is made of the flat barley which groweth vpon the eare in two ranks or sides only. *Thurannius* saith, That in the realms of *Granade*, *Andalusia*, and *Africk*, the barley whereof the said *Prisane* is made, is smooth and naked in the eare without eiles or beard at all. He also is of opinion, that Rice and the graine *Olyra*, are all one. The manner of preparing husked barley and making *Prisana* is so commonly knowne, that I need not to say a word thereof.

As

L

M

* Act. 1. 11. 11. 11.

* 1. 1. 1. 1.

As for Tragus, it is a kind of Ptiſane, made of Wheat, after the ſame order that the former of Barley. Howbeit, there is none of it to be found but in Egypt and Campaine. Touching Starch-floure called Amylum, it may be made of all kinds of wheat, and of the fine corne Siligo. Winter wheat, but the principall is that which they make of the three-month or ſummer wheat. We are beholden to the Iſland Chios for the inuention of Starch: and euen at this day, the very beſt is that which commeth from thence: called it is in Greeke Amylum, becauſe it neuer came into the mill, nor was ground vpon ſtones. The next to it in goodneſſe, is made of a certaine Summer Wheat that is nothing ponderous and weightie. The way to make it, is to ſteep the wheat within certaine cooperie veſſels, made of wood, in freſh water ſo much as will couer it wel. But it would not be forgotten, that the water muſt be changed ſixe times in a day: and if it were ſo ſerued alſo in the night, it would be the better, to that end, that beeing thus ſoaked and ſoftened, it might be well mixed and incorporated, yea, and reſolued (as it were) into a kind of paſt, before that it become ſoure and bitter. This beeing done, it muſt be laid to drie either vpon linnen cloths, or elſe in twiggen paniers, that the liquor which is therein may draine away: afterwards vpon tiles, beſmeared ouer with ſome leauen, it is poured forth to take the Sunne, to drie and harden againſt it. After the Chian Starch, that of Candie is moſt eſteemed and liked of: and laſtly, that which commeth out of Egypt. The good Starch ougth to be light, ſmooth, and euen, and withall, freſh made: for thoſe properties hath *Cato* ſet downe already.

To returne againe vnto our Barley: the meale thereof is of great uſe here with vs in Phyſick. And that which more is, a ſtraunge effect it worketh in Horſes, Aſſes, and ſuch like labouring beaſts: for take Barley when it is dried and hardened at the fire, grind it to meale, reduce it into a paſte, and make thereof gobbets: let theſe be put downe by a mans hand into their bellie, after the manner of cramming Pullen, and you ſhall ſoone ſee, that this food and manner of feeding, ſhall make the beaſts more ſtrong and luſtie, and their fleſh more faſt and compact.

As for Barley eares, ſome there be which haue but two rankes or rewes: others againe haue more, euen to the number of ſixe. In the very graine alſo there is much difference: for there be many of them longer than other, lighter, ſhorter, rounder, whiter, blacker, and laſt of all, inclining to a reddiſh or purple color. This is the worſt of all others for to make drie Grout or Polenta: and as for the white, it is beſt for that purpoſe, but will not abide any tempeſtuous or hard weather. And to ſay a truth, of all corne, Barley is the ſoſteſt and tenderſt, and will leaſt endure any hardneſſe: It would not be ſowed, but in a drie and fine ground, laid light, and brought into temper: howbeit, good it muſt be, and well in heart. The chaſſe and pugs that come of Barley, is ſuppoſed to be as good as the beſt: but for ſtraw it hath no fellow, eſpecially to make litter of. Moreover, in this regard, Barley of all other graine, is leaſt ſubject vnto blaſting, for lightly it is cut downe before Wheat is mieldewed. And therefore it is, That the wiſer ſort of huſbandmen in the countrey, ſow no more Wheat than will ſerue for the prouiſion of their houſe only. Furthermore, they ſay, that Barley is ſowed with the rake, namely, when the mould lightly couereth it: and therefore it commeth vp ſooneſt, and bringeth moſt encrease and plentie. That which is gathered at Carthage in Spaine, within the moneth of Aprill, is ſowed the very ſame moneth in Celtiberia, ſo as in one yeare it yeeldeth two crops. It is no ſooner ripe, but they make greater haſt to cut it downe, and to inne it, than any other corne: for the ſtraw is very brittle, and the huſke which contains the grain is as thin and ſmall. To conclude, it is thought to yeeld the better groats if it be taken whiles it is ſomewhat green, rather than if it ſhould haue the full ripeneſſe.

CHAP. VIII.

¶ That all kinds of Wheat or Fourmenty corne grow not indifferently in euery place. Alſo, of other ſorts of corne in the Leuant or Eaſt countries.

You ſhall not find in all places the ſame kinds of Wheat: and where you meet with the very ſame, yet they bear not one name, but haue ſundry appellations. The red bearded wheat named in Latin Far, and which in old time they called Adoreum; the winter wheat Siligo, and the

A the ordinarie white Fourmenty wheat Triticum, are the commonest of all others. And indeed theſe grow all in moſt countries. As for Arinca it loueth Gaule beſt, and that is the native and proper country for it. Howbeit there is plenty thereof in Italy alſo. As for Zea, Olyra, and Typhē, there be ſundry ſorts of wheat and Rie peculiar and appropriate to Egypt, Syria, Silicia, Aſia, and Greece. The Egyptians make of their wheat a kind of floure or ſifted meale, but nothing comparable to the Italian. They that vie Zea or Spelt haue not the fine red Wheat Far. And yet we are ſtored therewith in Italy, and moſt of all in Campain, where it is called by the generall name of Seed: which name no doubt was giuen vnto it for excellencie and ſingularitie, as ſhall be ſhewed anon more at large. This is the very grain for which *Homer* the poet called the earth, *βύβλις ἔρπη*, i. yeelding the corn Zea: and not becauſe the giueth life to all liuing creatures, as ſome would haue to be meant by that Epithete. Thereof is made alſo a kinde of ſtarch, but groſſer than the former, whereof we ſpake before: for no difference is there elſe. Of all kinds of wheat, Far (which is taken for the red bearded wheat) is moſt hardy, and beſt reſiſteth winter cold: it will wel abide the coldeſt ſoile that is, and that which is leaſt labored and tilled: it may endure alſo hot and dry places: it yeelded the firſt food and meat to our antient forefathers in Latium; as may appear by this good argument, that publique preſents and rewards by way of remuneration were giuen of Far, which they called Adorca, as hath beene ſaid before. Moreover, that the Romans for a long time liued of a kinde of batter or gruell made of meale ſo, and not of bread, is very euident by old records and Chronicles: for euen at this day ſuch thick gruels or pottage be called Pulmentaria in Latine. And *Ennius* a moſt antient poet, when he would expreſſe the famine of a city that had endured long ſiege, reporteth, that the parents took by force from their children their ſops, notwithstanding they cried pittcouſly for very hunger. Moreover, euen in our time wherein we liue, the ſacred and ceremonious feaſts by vs obſerued in memorial of our birth daies and natiuitie, ſtandeth much vpon ſurmenty, gruel, fritters, and pan-cakes. It ſeemeth alſo, that our gruels and ſuch like pottage were as much vknown to Greeks, as their Polenta or dried groats were ſtrange to vs here in Italy. There is no corn more hungry and greedy of nourishment than Seed [wheat,] or that draweth more vertue and fat out of the earth for nutriment, touching the winter grain, called in Latine Siligo, I may be bold to ſay, it is the daintieſt and moſt delicate wheat that is, for whitenesse, mildneſſe, and lightneſſe. It agreeth wel with moſt countries, ſuch as Italy is, and that part of Gaul called Comata, i. Lumbardy. Beyond theſe is alſo in Sauoy only, and the territorie of the Meninians, it will endure and hold the owne ſeason well. Many in other parts of that countrey, within two yeares it turneth into the common wheat. The only remedy therefore is, to chuſe forth the heauieſt and weightieſt cornes, and them to ſow.

CHAP. IX.

¶ Of Paſtry, of Grinding, and of Meale.

The beſt manchet bread for to ſerue the table, is made of the winter white Wheat Siligo, and the moſt excellent works of paſtrie likewise are wrought thereof. And yet in Italie it paſſeth all the reſt, in caſe that of Campain be blended with another ſort which doth grow about Piſa: for the Wheat of Campain is redder, but this of Piſa whiter: and more weighty it is, if it come from a chalky ground, or haue chalk mingled among. Moreover, this is the ordinary proportion, that of the very pure corn of Campain wheat, which they cal guelded, i. wel huſked and clenſed, a meaſure named Modius ſhould yeeld four Sextars or quarts of fine meale: but of the vulgar and common grain, which is not ſo guelded, 5 sextars, and halfe a Modius beſides of bolted flour: and for a courſer houſhold bred, which they call the ſecond bread, 4 sextars of meale, and as many of brans. Alſo of the Piſane wheat, one Modius ſhould yeeld ſixe sextars of good meale, and the reſt equall to the former. As for the Cluſine and Aretine wheat, in euery Modius it answereth again ſix sextars of meale, that is to ſay, one more than the reſt: otherwiſe they be all alike. Now if you liſt to range and boult it for cork flower to make bread, ye ſhall haue of manchet 16 pound, of courſe houſhold bread three, and halfe a Modius of brans. But this proportion doth not alwaies hold, for it alſo according to the good or bad grinding vpon the mill: for that which is ground dry rendereth againe more meale: but if it be wet or beſprinkled with ſalt water, it maketh the fairer meale, and fuller of fine flower: and

then shall ye haue more go away in brans. As for the word Farina in Latine, *i. meale*, it is deriued of Far, which in old time was the best & finest red wheat, as may appeare by the very name that it carieth. Finally, a Modius of meale comming of the French Siligo, called Blancheen, or Ble-blanch, maketh in bread 22 pound weight: but of our Italian, 3 or 4 pound more in bread pan-baked: for what corn focuer it be, there must be allowance of two pound vantage ouer and about, for ouen-baked bread.

CHAP. X.

Of the meale called Similago: of the white flower Siligo. Of other sorts of Meale: and of the manner of baking.

The best meale of that kind, which they call in Latine Similago, is made of the common wheat. If the corne come out of Africk, it yeeldeth ordinarily for euery Modius, half so much in ordinarie meale, and five sextars besides of flower called Pollen: [for that is the Latine tearme which they vse in the finest of the common wheat Triticum, proportionable to that which in the other winter wheat Siligo, they call Flos. And great vse herof there is in copper-smiths forges, and in work-houses where paper is made.] Ouer and besides, of courser grodgeons for brown bread foure sextars, and as much of brans. More ouer, the ordinarie proportion goeth thus, that of one Modius of the fine meale Similago, there should be made 122 loues of bread: & that a Modius of the pure flower of Siligo should yeeld 117. As touching the price, thus it goeth commonly in the market one yere with another, when corn is at a reasonable and indifferent rate: A Modius of down-right meale is worth * 40 Asses: but if the meale be sifted and ranged from the grosse brans vntill it be Similago, it will cost eight Asses more: and if it be boulded yet finer to the nature of the fine flower Siligo, the ouer-deale in the price wil be double. Another distinction or difference there was known of this proportion, when a Modius comming of wheat of Similago, was seen to answer 17 pound in bread: and as much of Wheat flower called Pollen, thirtie pound and foure ounces: besides, for second household bread, two pound and a halfe; and of the coursest or brownest as many, and fix Sextars ouer and about of brans.

* 1. 2 lb. 6 d.

But to return to our winter white wheat called Siligo, it neuer ripens kindly & all together, as other corn doth: and for that it is so tender and ticklish, as that no corn wil lesse abide delay and tarry on worse, great heed must be taken thereof; for so soone as any is ripe, presently the feed sheds and falls out of the eare. Howbeit, lesse danger is it subiect vnto whiles it standeth in the field, than other kinds of wheat, for it beareth alwaies an vpright spike or eare: neither wil it hold and retain that mildew which blasteth corn so much, and turneth it into black powder. As for that kind of corn which they call Arinca, it maketh the sweetest bread: the grain it selfe is more fast & full than the fine red wheat Far, it carieth a bigger eare, and is besides more ponderous and weighty. Seldom is it seen, that a Modius of this grain maketh full 16 pound. In Greece they haue much ado with it, to thresh it cleane and salter it from the huls and eiles. For which cause Homer saith, that they were wont to giue it as prouender to horses, and such labouring garrons; and the very same it is which he calleth Olyra. Howbeit this corn in Egypt goeth out easily vnder the flail, is better to grind, and withal yeeldeth better, and is more fruitfull. The Red-wheat called Far is polled wheat [in Egypt] and carieth no beard or eiles about it. So is the white winter Wheat Siligo, saue onely that which is named Laconica. To these may be adioyned other kinds also, to wit, * Bromos, the poll wheat Siligo, (differing from all the other of that name) and Tragos: strangers all brought from the Levant or East parts, and resembling Rice euery one. Type likewise is of the same kind, whereof in Italy and this part of the world is made that husked corne which goeth among vs for Rice, for it turneth into it. The Greeks haue a kind of wheat called Zea or Spelt: & it is commonly said, that both it and Typhae (considering that they vse to degenerate and prone bastard) will turne to their kinde again, and become wheat, if they be husked before a man sow them: howbeit this change will not be seen presently, nor before the third yere. As touching our common wheat, there is no grain more fruitfull than it: this gift hath Nature endued it withal, because the meant thereby to nourish mankind most; for one Modius thereof sowne, if the soile be good and agreeable thereto (such as hath about Bizacium, the champion country of Africke) will yeeld an hundred

Some take it for a kinde of Bulley, or rather Oats.

A hundred and fiftie fold againe. The procurator generall of that prouince vnder Augustus Caesar sent from thence vnto him one plant thereof (a wondrous thing and incredible to be reported) which had little vnder 400 straws springing from one grain & meeting all in one and the same root, as it appeareth vpon records by the letters sent, testifying no lesse. Likewise to the Emperour Nero he sent 340 straws out of the same country, rising all from one onely corne. But to goe no farther than to Sicilie, within the territorie about Leontium, there haue bene certaine fields knowne, wherein one graine putteth forth no fewer than a hundred stalks with eares vpon them: and not there onely, but also in many other parts of that Island. And this is ordinarie throughout all the kingdome of Granade, and Andalusia in Spaine. But about all, the land of Egypt may make boast in rendring such interest to the husbandmen. Moreouer, of all those kinds of wheat which are so plentiful, there is principal account made of that which branches, as also of another which men call Centigrammum, *i. the wheat that beareth 100 graines.*

To leaue this kind of graine, and to come to Pulse: there hath been found in Italie, and goe no farther, one beane stalle laden with an hundred beanes. Touching Summer corne, to wit, Sesama, Miller, and Panicke, we haue already spoken. As for Sesama, it commeth from the Indians, whereof they make a certaine kind of oile. The color of this graine is white. Like vnto it there is another grain called Erythimum, which is rise in Asia & Greece: and I would say it were the very same, that with vs in Latine is named Irio, but that it is more oileous and fatty; and indeed to be counted a medicinable or Physicall plant, rather than a kind of corne. Of the same nature, is that which the Greekes call Hormium: it resembleth Cumin, and is vsually sowed with Sesama: howbeit no beast will eat thereof while it is Greene, no more than they do of Irio aforesaid.

To come now to the manner of husking and cleansing of corne: the feat is not so easily done in all, as in some; for in Tuscan, they take the eares of their red wheat called Far, when they be parched and dried at the fire, they pound or bray them with a pestill headed at the nether end with yron, or els fistulous and hollow within, yet bound about with a hoop or ring of yron, and the same withinforth toothed in manner of a star, so as if they be not heedfull in the stamping, the yron-work at the pestill end will either cut the cornes in two, or els bruise and break them clean. In Italy (for the most part) they vse a reed or plain pestill, not headed with yron, to huske and dresse their corn, or els certain wheelles that are turned and driuen apace with water, which **D** going very swift doe also grind the said corne. But since we are fallen into this treatise concerning husking and grinding of corn, it shall not be amisse for to set down the opinion and resolution of Mago in this behalfe: First, for common wheat he giueth order, that it be well steeped and foked in good store of water; afterwards, to be rid from the huls and eiles that it hath, in a mortar: which done, it ought to be dried in the sunne, and followed a second time with a pestill. In like maner (saith he) should barley be vsed: howbeit, two Sextars or quarts of water will be sufficient to besprinkle and wet twentie Sextars of barley. As for Lentils, he would haue them first parched and dried, and then lightly punned or stamped together with brans, or els to put vnto twentie Sextars thereof, a fragment or peece of a broken semeld brick, and half a Modius or peck of sand. Ervile would be cleansed or husked as Lentils be: but Sesama, after it hath bin infused or foked in hot water, he saith, ought to be laid abroad a sunning; then to be rubbed hard together, and afterwards to be put into cold water and therewith couered, so as the huls or chaffes do flore and swim aloft: which done, to be laid forth a second time in the sun vpon linnen clothes, for to drie. Now if all this be not don one thing after another and dispatched with the more speed and hast, it wil loose vinev or catch a mouldineffe, and besides lose the bright native hew, and looke wan and of a leaden colour. Now, say that corn be cleansed and husked, some one way and some another, it is ground afterwards in diuers sorts. If the eares be bolted by themselves alone for goldsmiths worke, the chaffe comming thereof is called in Latine, Acus; but if it be threshed and beaten vpon a paved floor, eare, straw, and al together (as in most parts of the world they vse to doe, for to fodder cattell and to giue in prouender to horses, then it is **F** teamed Pal: but the refuse or chaffe remaining after that Panick or Sesama be clenfed, they call in Latine Appluda, how foueuer in other countries it be otherwise named.

To speake more particularly of Miller, there is great store thereof in Campaine, and there they set much by it, for of it they make a kind of white greuel or pottage: also the bread thereof is passing sauerie and sweet. The Tartarians also & nations in Sarmatia, feed most of this water

Ccc

gruel

gruell made with Millet: as also with the crude and raw meale thereof vnfodden and vn Timer G
tempered with mares milke, or els with horse-bloud that runneth out of their master leg-vains,
by way of incision made for the purpose with the phleame. As for the Æthiopians, they know
no other come but Millet and Barley. Panicke is eaten in some parts of Gaule, and principally
in Aquitaine or Guien: in Piemont also, and all about the Po, it is a great feeding, so there bee
beanes among; for without beans they canot skill how to dresse any thing for their daily food.
The regions that confine vpon the Euxin sea or Pontus, haue no daintier meat than that which
is made of Panick. To conclude, all Summer corn abouenamed, delight more to grow in moist
and watery grounds, than to be wet with showres and raine from aboue. And yet I must needs
say, that Millet and Panick care least for water or moisture, when they begin to put forth their
blade. Last of all, there is no good husbandman but will forbid to sow Millet and Panick either H
in vineyards, or among trees that beare fruit; being perswaded, that the sowing thereof doth eat
out the heart of the ground.

CHAP. XI.

¶ Of Leuains: the manner of making bread: sundrie kinds of bread: about what time
Bakers were first knowne at Rome: of Sicues and Serces, of Rangers and Bul-
scrs. Last of all, of the Frumentie called Alica.

THE meale of Millet is singular good for Leuains, if it be wrought and incorporat in new
wine, for so it may be kept a whole yeare. The like is made of the better brans of wheat, so I
they be small, fat, and not to neer raunged; and the same be kneaded in new white wine of
three daies old, and then dried in the sunne. Hereof is made a dough or past, and the same is re-
duced into certain round cakes or Trofches to serue for the making of bread, for these must be
foked and dissolued in hot water with the floure of the corn Zea, and therein be sodden, which
don, they vse to mingle it with the meale and floure to make past of, which they hold to be the
best way of making bread. The Greeks haue set down this proportion, allowing to euery pecke
or Modius of Meale, 8 ounces of leuaine; and this they thinke to be sufficient. Now these kinds
of leuains verily canot be made, but only in time of vintage. But if a man would make leuaines
at any other time, he may take of barley meal tempered with water so much as it may be brought
into a past; and when there be certain lumps or cakes herof made, weighing two pound apeece, K
they must be baked either vpon the hearth vnder hot embres, or els in an earthen pan ouer the
coles, vntill such time as they looke brown and red withal. Afterwards they be put vp close co-
uered in pots or such like vessels, & there remain vntill they wax fower. Now when a man would
vse leuain, herof he taketh what he will, and dissolueth it as is afore said. In old time when they
made barley bread, they vsed no other leuain for it but only the meale of Eruille or Cich pease;
and ordinarie it was, to take two pound thereof for * two peckes and an halfe of meale: but now
adaies the order of our huswiues is, to make leuaines of the very same meale which is kneaded
and wrought into dough, before salt be put therto, which they seeth to the consistence of a pulp
or thicke batter, and so let it lie vntill it become fower. And yet commonly they doe not boile
their leuains but only referue some of the past or dough, wherof they make their bread the day L
before. As touching the nature of Leuain, certain it is that it proceeded of fourenesse, like as it
is generally held, that they be stronger of bodie who feed of leuained bread: for in old time it
was verily thought, that of the weightiest and heauiest kind of wheat, there was made the hole-
somest bread.

Concerning the sundrie sorts of bread that is made, it seemeth a needlesse peece of work to
set them down euery one in particular: for sometimes bread taketh the name of the meats and
viands that be eaten therewith: as for example, Oister-bread, so called for that it was good with
oisters: otherwhiles it beares the name of some daintie cates, as Artologanus, [i. pancake, fritter,
or fine cake bread.] As for the bread called Speusticus, [i. Hastie] it is so called, because it was
made in haist. The manner also of the baking giueth denomination to some bread, as to Furna-
ceus panis, which was made in a furnace; to Artopitius, made in a baking-pan called Artopra: M
as also to that which was baked in an ouen. Not long since also there was a new deuice of mak-
ing bread brought out of Parthia, which because the past is drawne through water (and yet a
spungious, light, and hollow substance it carries) they call water-bread, and giue it the denomi-
nation

A nation of Parthiecke bread. But howsoeuer it be, the best bread is of the finest wheat floure, that
hath passed through a smal tamis bulter. Some countries there be, that knead their dough with
milke or eggs; others also put butter thereto: but those be such nations as are not troubled with
wars, since that they can haue while to set their minds on sundry sorts of pastry. The Picenes in
times past inuented away by themselves of making bread, with the very matter or substance of
the frumentie Alica; and surely that deuise holdeth stil and is much vsed. The manner thereof
is this: They take the said frumentie past and steep it in water nine daies, on the tenth day they
work or knead it with the iuice of Raifons, to the fashion of the Parthick cake driuen thin and
broad, after this they put it into earthen pots, set them in ouens for to frie & bake, that the said
pots may there breake in funder: and beeing thus hard baked, it is not to be eaten vnlesse it be
B foked in some lipuor, which ordinarily is milke, or mead especially.

There were no Bakers known at Rome for the space of 580 yeres after the foundation of the
citie, vntill the Persian warre. Before that time euery Roman citizen had his owne bread baked
at home, and womens work commonly it was, like as at this day it is in most countries: for this
appeareth by Plautus, who in his Comedie entituled Aulularia, maketh mention of * Artopia, ^{Ego hanc Ar-}
a baking pan [which men haue usually in their houses:] and hereupon is growne much dispute ^{topiam: ex pro-}
and controuersie betwene learned men about this Question. Whether that verse were of that ^{ximouen-}
Poets making or no? for certain it is (according to the opinion of A. Atticus Capito) that at such ^{dampus.}
mens bounds as kept great houses and delicate fare, there was no other bread eaten but such as
C Cookes were wont to make them, after the manner of simnels: for Pistores were those only then
called, who husked and cleafed the bearded red wheat named in Latin Far; and others Bakers
than they, were there none. Neither had the Romane citizens in ordinarie, any Cookes as their
household seruants, but hired them out of the market whensoever they had any meat to dresse.

Diuers sorts of sicues and bulters there be. The Sarce made of horse haire, was a deuise of
the Frenchmen: the tamis raunzer for course bread, as also the fine floure bulter for mancher,
(made both of linnen cloth) the Spaniards inuented. In Ægypt they made them of Papyr reed
and rushes. But now that we are entred so far into this matter as touching come, I thinke it not
amisse before I proceed any farther, to speake (with the first) of the frumentie called Alica, and
the manner thereof being (as it is) so excellent and wholesome to be eaten; and which, no doubt,
throughout all Italy, beares the name for the very best of all come whatsoeuer. No question, but
D there is made thereof in Ægypt; howbeit nothing to the other. In Italy, many places there be
where it is to be had, as namely in the territories of Verona and Pife: but that of Campain ca-
rieth the price and praise aboue all the rest: a champion or plaine countrey this is, for the space
of forty miles lying as a vale vnder the hills and mountaines, subiect to watery clouds and tem-
pestuous winds. The soile of this whole tract (to speake directly of the nature thereof and defer
no longer) is light and dustie, if a man respect the vpper coat thereof, but vnderneath it drinks
in much moisture, whereunto apt it is by reason of certain fistulous porosities therein, like a pu-
mish stone: in which regard, the mountaines commanding these plaines (ill neighbors other-
whiles) do it much good and mend the soile very well; for many a found showre, which ordina-
rie falleth from the hills) passeth and runneth through it, as it were a colander; by means wher-
E of, the ground standeth not drenched and foked with water, but is thereby more pliable & easie
to be tilled. Now this soile hauing thus receiued store of water, doth not yeeld it vp again boi-
ling out at any springs, but keepeth and cherisheth it still within, as it were the radical and nu-
tritiue humor, concocting the same to a very good temperature. All the yere long a man shall
see it sown and standing with corn, one or other; for the same ground beares one crop of Panick,
and two of the red wheat Farrit: neuer refresheth but beareth somewhat: for say that some lands lye
fallow between-while, and are not sowed with corn; they yeeld roses in the spring of themselves
naturally, and those far sweeter than the garden roses: so fruitful is it and canot abide to be idle
and do nothing. Hereupon arose the prouerb of this land of Campaine, That greater store is there
to be found of sweet posumes and odoriferous ointments, than of simple oyle in other countries whatsoeuer.
F And looke how much this tract of Campaine surpasseth all other lands in goodnesse and fer-
tility, so much excelleth one quarter thereof called in Latin Laboria; and by the Greeks Phle-
graum) all the rest, and goeth beyond it selfe. This plain afore said named Laboria, is confined
on both sides with the great caufis or high waies raised by the Consuls and thereupon called
Consulares; the one goeth from Putcoli, the other from Cumes, and lead both to Capua.

But to come againe vnto our Frumentie Alica, made it is of the graine Zea, which before we rearm'd by the generall name of Seed. This corne for to make Frumenty, is to be pound in a wooden mortar, when it should be cleafed from the huske: for if a man beat in one of stone, the hardnesse thereof would bruiſe and breake it. The best way of cleaſing and husking it, is with a pestill, such as bondslaves and prisoners do vse to stamp withall, and to work by task for their punishment: in the forepart thereof it hath a circle of yron, made in fashion of a round Box: wherewith after the corne is drawn naked out of the husk, the very same instrument serueth again to stamp and bruiſe the white marrow and floure thereof within. And thus by this means there be three sorts of Alica or Fourmentie aforesaid. The finest, which is the best: the meane, which is the second: and the greatest or grossest, which the Greekes call Apharema.

When all this is done, yet haue they not that whitenesse of their owne, for which cause they are so much esteemd; as namely, those that are come nowadays from Alexandria, which are taken to be the best and to excell all other. And therefore there is chalk (a wonderfull thing to be spoken) mingled afterwards and incorporate therewith, and so by that means the Frumenty becomes white and tender withall. Now this chaffe or plastre is found between Puteoli and Naples, in a little hill which thereupon is called Leuco-gaon, [i. white earth.] And in truth when Augustus Caesar, late Emperor of Rome, erected a colonie at Capua, and peopled it with Roman citizens, he assigned vnto the Neapolitanes (by vertue of a decree, now extant) an yerely rent or pension of twentie thousand deniers to be paid out of his owne treasure, in regard of the chalk which came from the hill aforesaid, being within their territorie and siegnorie. He rendereth also a reason inducing him thus to do, because the inhabitants of Capua, alleaged, that they could not make good Alica or Frumenty without that mineral of chaffe. In the same hill there is also found a Brimstone mine, and out of the veines thereof, fountaines springing, called Oraxi, the water whereof is singular good to cleer the eies, to cure and heale green wounds, and to fasten the teeth that are loose in ones head.

As touching a bastard kind of Frumenty, it is made verily for the most part of a Speltor Zea in Affrick, which there doth degenerat and grow out of kind. The ears that it carieth, are broader and blacker than the other, and the straw is but short. They vse to cleaſe and huske it by stamping or braying it together with sand, and for all that deuise, much ado they haue to fetch off the huls and huskes wherein the graine lieth enclosed: now when it is thus cleaſed and naked, it is not past halfe as much in measure as it was before. Which done, there is a fourth part of plastre strewed & mingled among; and when al is together, they sift it down through a meal sieue. That which remaineth behind and passeth not through, is the grossest part thereof, and is called in Latine Exceptitia. That which was thus searced, is driuen againe through a narrower and finer sieue, and those groats that tarie in the ranger, the call Secundaria. In like manner doe they a third time, searcing it through so fine a sieue, that nothing can passe but the very small sand and poulder: and this last kind of Frumenty gurts they name Cibraria. Another way there is besides in all places practised, to sophisticat, and counterfeite the right Frumenty groats indeed: They chuse out of our common Wheat, the fairest, fullest, and whitest grains, which beeing half foddren in an earthen pot, they lay out afterwards in the Sun, till they be as drie as they were at first: which don, they lightly sprinkle some water ouer, & then bruiſe them in a quearn mill. Fairer Frumentie groats be made of Zea than of Wheat, and called it is Granum or Granatum, although in Alica that be counted a fault. To conclude, they that wil not vse chalk, do blanch and make their Frumentie white by seething milke with it, and mingling all together.

CHAP. XII.

¶ Of Pulse.

It followeth now to write of the nature of Pulse, among which, Beanes do challenge the first ranke and principall place: for thereof men haue assaied to make bread. The meale of Beanes is called in Latine Lomentum. There is not a Pulse weigheth more than it, and Beane meale makes every thing heavier wherin it is. Now adaies they vse to sel it for prouender to feed horses. And indeed Beanes are dressed and vsed many waies, not only to serue all kind of four-footed beasts, but also for man especially. For in most countries it is mingled with Frumentie corn: and namely with Pannicke most of all, whole and entire as it is: but the more delicate and daintie

A daintie way is to break and bruiſe it first. Moreo uer, by ancient rites and religious ceremonies, at the solemn sacrifice called Fabraria, the maner was to offer vnto certain gods and goddesſes Beane cakes. This was taken for a strong food, being eaten with a thick gresle or portage; howbeit, men thought that it dulled a mans senses and vnderstanding, yea, and caused troubleſome dreames in the night. In regard of which inconueniences, Pythagoras expressely forbade to eat Beanes: but as some haue thought and taught, it was because folke imagined, that the soules of such as were departed, had residence therein: which is the reason also, that they be ordinarily vsed and eaten at the funerals and obsequies of the dead. Varro also affirmeth, That the great Priest or Sacrificer called the Flamine, abstains from Beanes both in those respects aforesaid, as also for that there are to be seen in the floure thereof certain letters or characters that shew heauines and signs of death. Further, there was obserued in old time a religious ceremonie in Beanes: for when they had sown their grounds, their maner was, of all other corne to bring back with them out of the fields some Beanes: for good luck sake, preſaging thereby, that their comewould returne home again vnto them; and these Beanes thereupon were called in Latine Refruiæ, or Reſeruiæ. Likewise in all port-sales it was thought, that if Beanes were entermingled with the goods offered to be sold, they would be luckie and gainfull to the seller. This is cerataine, that of all the fruits of the earth, this only will be full and found when the Moone is croissant, notwithstanding it were gnawne and halfe eaten with some thing before. Set them ouer the fire in a pan with sea water or any other that is saltish, they will neuer be thoroughly foddren. They are set or sowne before the retrait of the Starre Vergilia, [i. the Brood-hen] the first of al other Pulse, because they might take root betimes and preuent the Winter. And yet

B * Virgil would haue them to be put into the ground in the Spring: like as the manner is in Piemont and Lombardie, all about the riuer Po.

But the greater part of good Husbandmen are of this opinion, That the stalle or straw of Beanes sowne early or set betimes, are better than the very fruit it selfe, which hath had but three months being in the ground. For the cods and stalks only of Beanes are passing good fodder and forage for cartell. Beanes when they are blooming, and in their floure desire most of al to be refreshed with good store of rain: but after they haue don floueing, they care for little: the sowing of this Pulse in any ground, is as good as a mucking vnto it, for it enriches it mightily. And therefore towards Macedonie and about Theſſalie, the manner is when Beanes begin to blossom, for to turne them into the ground with the plough. Beanes come vp and grow in most places, of their owne accord without sowing; and namely, in certaine Islands lying within the Northern ocean, which our countrymen therupon haue named Fabariae. Semblably, they grow wild commonly throughout Mauritania, but exceeding hard and tough they be, and such as possibly cannot be foddren tender. There are likewise in Ægypt to be found Beanes, with a stalk beset full of prickles or thornes: which is the cause that Crocodiles wil not come neer them, for feare of hurting their eyes. The stemme of these Beanes is foure cubites in height, but exceeding thicke and big withall: tender it is notwithstanding, and soft, running vp euen and smooth without any knots or joints at al, it caries a head in the top like Chesboule or Poppy, of a rose red color: wherein are contained not about 30 Beanes at the most. The leaues be large: the fruit it selfe (or the Bean) is bitter in tast, and the sinel not pleasant: howbeit the root is a most dainty meat, which the inhabitants do eat as wel raw as foddren; and like it is to reed & cane roots. These grow in Syria and Cylicia, as also about the lake Torone, within Chalcis.

As touching other Pulse, Lentils be sown in Nouember, and so are Pease, but in Greece only. Lentils loue a light ground better than a fat & heauie: they like also drie and faire weather. Two kinds thereof be found in Ægypt: the one more round and blacke than the other, the rest be fashioned as common Lentils. According to the manifold vse and diuers effects of Lentils, there haue fundrie names and denominations bene borrowed from them: for I find in writers, that the eering of Lentils maketh men to be mild and patient, whereupon they be called Lenti and Lenes. As for Pease, it ought to be sown in warm places lying well vpon the Sunne: for of all things it cannot abide the cold. Which is the cause, that in Italie and in other countries where the clime is tough and hard, they are not sowne vsually but in the Spring, and folke chuse a gentle, light, and loose ground.

To come now to the Cich pease, the nature of it is to be nitrous and saltish, and therefore it burneth the ground where it grows. Neither must it be sowne, vntill it be well steeped and

foked in water the day before: many sorts there be of these cich-pease, different in bignes, form, colour, and tast: for there are both blacke and white, and those in fashion shaped like to a Rams head, and therupon they are so called. There is a second kind named Columbinum, or by others Venerium. These are white, round, light, lesse than the former Rams-head ciches, which men do eat ceremoniously with great religion, when they meane to watch thoroughly all night long. There is a little cich pease also, called Cicercula, made cornered and otherwise vneuen, like vnto a Pease. But the best ciches and most pleasant are those that come neereft in resemblance to the Ervile: and generally the red kind and the black are more firm and fast than the white: cich pease grow within round cods, whereas other Pulse he contained in long and flat, according to the forme and figure of the seed which they hold: Pease by themselves haue a long round cod in forme of a Cylinder.

The Pulse called Phaseoli, [i. Kidney Beans] vse to be eaten cod and al together. These may be set or sowne in what ground you list, from the Ides of October to the Calends of Nouember. Finally, all kinds of Pulse, so soone as they begin to ripen, are to be gathered or plucked hastily: for stay neuer so little, they leape out of their cods, and shed, and being once fallen, they lie hidden in the ground, like as the Lupine also.

CHAP. XIII.

¶ Of Rapes or Neneues of Amiternum Turneps.

Now let vs proceed and passe to other matters: and yet in this discourse, it were meet to write somewhat as touching Rapes or Nauews. The Latin writers, our countrey men, haue slightly passed by and touched them only by the way. The Greeks haue treated of them somewhat more diligently, and yet among pot-herbes and worts growing in gardens; whereas indeed according to good order they would be spoken of immediatly after Corne, or Beanes at least wise, considering there is not a plant of more or better vse than is the Rape or Nauew. First and formost, they grow not only for beasts of the earth and the Fowles of the aire, but also for men. For all kinds of Pullen about a Farme-house in the countrey, doe feed vpon the seed thereof as much as of any thing else, especially if they be boiled first in water. As for four-footed beasts, they eat the leaues thereof with great delight, and wax fat therewith. Last of al, men also take as great pleasure and delight in eating the leaues and heads of Rapes or Nauews in their season, as they do of young Coly-flories, Cabbages, or any tender crops of hearbs whatsoever; yea, when they are faded, flaggie, and dead in the Barn, they are esteemed better, than being fresh and green. As for Rapes or Nauews, they will keep long and last al Winter, both within the ground where they grew: and being well wintered, they will continue afterwards out of the earth lying abroad euen almost till new come: so as they yeeld men great comfort to withstand hunger and famine. In Piemont, Lombardie, & those countreies beyond the Po, the people make the most account of gaine by gathering Rapes, next to wine vintage and corne haruest. It is not choise and daintie, of the ground where it will grow: for lightly it wil prosper where nothing els can be sowed. In foggy mists, hard frosts, and other cold weather, it thrives passing wel, and grows to a wonderfull bignes. I haue seene one of their roots weigh aboue fortie pounds. As touching the handling and dressing of them for our table, there be many waies and deuises to commend and set them out. Preferred they may be till new come, specially condite with sharp and biting Senuic or Mustard seed. Moreover, our Cooks know how to giue them six other colours besides their owne which is pure and naturall; they haue the cast to set euen a purple hew vpon them. And to say a truth, there is no kind of viands besides that, being thus painted & colored, hath the like grace. The Greeke writers haue diuided them by the sexe, and therby made two principal kinds thereof, to wit, the male and the female. Nay, more than that, out of one and the same seed, according as it is sowed, they can make male or female, whether they please. For if they sow thicke, and chuse thereto a hard and churlish ground, it will proue of the male kind. Also, the smaller that the seed is, the better it is esteemed. But of al Rapes male or female, three especiall sorts there be & no more. For some roots spread flat and broad, others are knit round like a ball; the third sort that runs downe into the ground with a long root in manner of a Radish, they call the wild Rape or Nauew: this bears a rough leafe and full of angles or corners; the juice that it yeelds is sharp, hot, and biting, which being gathered in haruest time & referred, mudi-

A mundiseth the eyes, and clearcth the sight, especially being tempered with brest-milke. If the weather be cold, they are thought not only to thrive in bigesse of the root, but also to proue the sweeter, whereas contrariwise in a warm season they run vp all to stalke and leafe. The best simply are those that grow in the Nursine territory. For they are sold by the weight: and euery pound is worth a Roman Sesterce, yea, and otherwhiles twaine, if there be any scarcity of them. Next to these in goodnes be those that come out of Algidum. I hus much of Rapes & Nauews.

As for the Turneps of Amiternum, they be in a manner of the same nature that the Rapes aforesaid, & cold they loue as well. Sown they are before the Calends of March; & foure quarts of their seed will take vp a whole acre of ground. The best Husbandmen, and such as are more exquisite in their practise of Agriculture, giue order, That the ground for Turneps should haue five tilthes, whereas Rapes or Nauews are content with foure: but both the one and the other had need of a soile well enriched with dung or compost. By their sayings also, Rapes will prosper the better and come vp thicker, if they be sowed in their hils, chaffe and all together. Moreover, they would haue the seeds-man to be naked when he sowes them, and in sowing to protest, that this which he doth is for himselfe and his neighbors, and wishall to pray as he goeth. The proper season for the seednesse of them both, is between the feasts of the two gods; to wit, Neptune and Vulcan.

To conclude, there is a subtil and curious obseruation that many go by and do hold, namely this, To marke how many daies old the Moon was, when the first snow fel the winter next before; for if a man do sow Rapes or Turneps, within the foresaid compasse of that time, the moon being for many daies old, they will come to be wondrous great, and increase exceedingly. Men vse to sow them also in the Spring: but then they make choise of moist and hot grounds.

CHAP. XIII.

¶ Of Lupines.

After Rapes and Turneps, the Lupines haue greatest vse, and serue to be raunged next: for that they indifferently serue both men and also all foure footed beasts that be housed, either whole or clouen. Now for that the stalke is very shittle in mowing, and therefore flyeth from the edge of the syth, the onely remedie therefore (that the mower may catch it) is to D goe to worke presently after a good shower. And verily there is not a plant growing vpon the earth (I meane of such as are sowne of seed) more admirable than the Lupine, in regard of the great amity and sympathie betweene the earth and it. Looke how the Sun keepeth his course in our Horizon aboue, so doth it turne and go withall; in so much as the Husbandmen of the countrey go by no other clocke to know how the day passeth, in close and cloudie weather, than this obseruation. Moreover, it hath three seasons of blowing: it loueth the earth well, but yet willingly it would not be coered ouer with mould: for this is the onely seed that is sowne vpon ground without any ploughing or digging: it would grow to chuse, in a most grauelly, drie, and sandy soile; and in no case can it abide any tending or husbandry about it: so affected is it to the earth, that cast it vpon any rough ground, among bushes, leaues, briars and brambles, it will chit and spurt neuertheless, & neuer in til it take root within the earth. If Lupines be sowed either in vineyards or vpon corne lands, they enrich the same and make the ground better, as we haue before written: and so little need haue they of dung, that they stand in stead of the very best. To say a truth, there is no graine lesse chargeable to be sowne, than it; nay there is none collecth nought at all, but it; for it needeth not so much as to be brought into the field: and why? it soweth it selfe presently in the same field where it grew: and smedding as it doth of the own accord, a man neuer needs to cast and throw it vpon the land, as other corne. It is first sowne, and last gathered: and lightly both these seasons fall out in the moneth of September, for if the Seednes preuent not the winter, so as it may haue good root before it commeth, it will be in danger of the cold. Ouer and besides, if it chance to lie bare and vncoered aboue-ground, left carelessly without any keeping, and that no raine come vpon it presently for to drie it into the ground, it is safe enough and catcheth no harme; for so bitter it is, that no lining creature will touch it: and yet for the most part the Husbandmen bestow a light furrow vpon it, and so couer it verie shallow. If the ground be fast and heauie, it loueth that it lest which standeth vpon a red clay. And for the maintaining and enriching of this kind of soile, it must be turned vp or eured after

after the third flouring; but in case it be grauelly or sandy, it wil serue to do it after the second. Chalkie grounds onely and myrie it hateth, and therein it wil not grow. As bitter as otherwise it is, yet if it be steeped and foked in hot water, it is mans meat also. Moreouer, one Modius, or pecke of Lupines is sufficient for to satisfie and feed an Oxe or a cow at a time; and this kind of prouender will make beasts strong and healthfull. Moreouer, the meale of Lupines applied to the bellies of yong children that haue the wormes, is a singular remedy. For the good keeping of Lupines, all men agree that they should be laid vp in some chimney or smokie place especially; for if they lie in a moist room, there be certain little worms that wil nibble off and eat the tip or nauill that it hath, and by that meanes marre it for euer sprouting againe. Finally, if Lupines be eaten downe by beasts, while they be greene in the lease, the ground where they grew must presently be ploughed vp.

CHAP. XV.

¶ Of Vetches and Eruille.

Vetches also do manure and fat the ground where they be sowed; neither be they chargeable or stand the husbandman in much: they be sown with one tilth; otherwise there needs no harrowing nor weeding: there is required no mucking; onely they would be couered with mould and the clods broken; for sowing of vetches, there be three sundry times, first, about the setting of the star Arcturus, that by the moneth of December it may get a good head for to be eaten with beasts; and it is generally holden, that being sowne in this season, it will bring the best seed; for say it be eaten downe then, it will carry the burden neuertheless: the second Seednesse is in Ianuarie: the last in March; and being then put into the ground, it will run vp most to blade, and yeeld the best forrage for cattell. Of all seeds that are cast into the earth, it loueth drought most: it can brooke also shade places well enough. The chaffe that commeth of the seed thereof, is excellent good; and better than any other, in case it were ripen when it was gathered. It robbeth vines of their nourishment, if it be sowed neere those trees wherto vines are wedded; in so much as a man may see euidently how they languish.

As touching Eruille, it asketh no great hand or trauell about it: yet thus much more attendance it requirith than Vetches, for that it must be weeded and grubbed about the roots. Besides, this kind of Pulse is of great vse in Physick; for *Augustus Caesar* was cured of a disease that he had, and recovered his health by the means of Eruille, as himselfe reporteth in some of his letters now extant. Moreouer, fise Modij or pecks of Eruille town, is sufficient to maintain and find a yoke of oxen. As for that which is sowne in March, it is hurtfull forage (men say) for kine and oxen: as also that which is sowne in Autumne, maketh beasts heauie and stuffed in the head: but that which is put into the ground in the beginning of the Spring is harmlesse.

CHAP. XVI.

¶ Of Fanigreeke: of Ric: of Dredge: of the prouender corne or Bolimong Ocymum: of Spanish Trefoile or horned Clauer-grasse, called in Latine Medica: of the Shrub Trifoile, named Cytisus.

For the sowing of Silicia or Siliqua, otherwise called Fanigreeke, there needs no more but to scarrifie or scrape it lightly vp with a furrow not aboue foure fingers breadth deepe; for the lesse cost and husbandry that is bestowed about it, and the worse that it is vsed, the better it prospereth and yeeldeth greater increase: a strange thing to be spoken and seldom verified, that Negligence should be any waies profitable; and yet herein it proueth true. That which is called Secale and Farrago in Latine, (i. Ric) needeth no more adoe but to be harrowed & the clods well broken. There is a kinde of Secale or Ric, which the people called Taurines dwelling vnder the Alpes doe call Asia: it is simply worst of all other, and good for nothing but onely to driue away hunger: plentifull enough this corne is and yeeldeth good increase, but the straw is slender: blacke it is and of an vnpleasant colour, howbeit exceeding weightie and ponderous: they vse to mingle the red wheat Far therewith, and make thereof a Mascelline, to allay the bitternesse thereof; and yet for all that, the bread which it maketh is most vnfauor to the mouth and ill for the stomack. It wil come vp in any ground whatsoeuer, and bring forth a hundred fold

ordina-

A ordinarily; neither doth it eat the ground out of heart, but rather maketh it more battle, and serueth in stead of compost or mucke.

As for that kind of dredge or sarrage which commeth of the refuse and light corne purged from the red wheat Far, it ought to be sowne very thickew, with Vetches otherwhiles mingled among. In Africke, the same mixture is made of Barley. All these are good onely for prouender and beasts forage: as also a bastard kind of Vetches called *Cracca, which pigeons loue so well, that if they be led once therewith, they will neuer leaue the place where they tasted it, nor flie far from thence. In time past our ancestors had a kind of fodder or prouender, which *Cate* called Ocymum, wherewith they vsed to stay the gurrie in kine and oxen. This forrage was made of *beane stalks cut downe greene as it stood before it was ioined and coddled. But *Sura Mantius* taketh this dredge to be another thing, saying, that in old time they vsed to put vnto ten Modij of beanes, two of Vetches, and as many of Eruille, and sower wont to blend al together and sow them in an acre of ground at the fall of the lease; and (saith he) it would be the better balimong if there were some Greek Ores mingled withall, such as neuer shed the seed out of the haw: this manner of dredge was called usually Ocymum, and was wont to be sowne for a kind of forrage to serue kine and Oxen. *Varro* saith, that it tooke that name because it commeth vp so speedily as being deriued from the Greeke word *οἰσιν*, which significth, Quicke, or Swift.

As for the grasse or herbe Medica (a kind of Clauer or Trefoile) the Greekes held it in old time for a meere stranger, as being brought into Greece from Media during the Persian warres, which king *Darius* leued against Greece: howbeit, an excellent Simple it is, and worthie to be written of in the first place. And to begin withall, this singular property it hath, That with once sowing, it continueth aboue thirty yeares without any need of renewing. Like it is to Clauer or three leaved grasse, both in lease and stalke, but that the stemme is parted by knots and ioints. Moreouer, as it riseth higher and runneth vp in the stalke, the leaues grow narrower: of this herb alone and of Cytisus, *Amphilochus* compiled one whole book; howbeit, he wrote of them both confusedly. The ground wherein it is to be sowed, after it is well rid of stones and clenfed, must be broken vp and well tilled in the fall of the lease. Soone after it needeth to haue another fallow and be harrowed withall, and then couered with hardles: this would be done two or three times (fise daies between) and therewith it ought to be thoroughly dunged. This herb requirith a sound dry ground, and yet such as is full of succulent moisture within, or else where water is neere at hand to command. The ground being thus prepared, ought to be sowed in the moneth of May following, for otherwise the frost would take it and marre all. Moreouer, requisite it is, that it be sowed very thick, so as euery place be taken vp therewith, thereby to exclude all other weeds and giue them no roome there to grow. To this effect therefore euery acre will take 20 Modij or pecks of seed. But take heed withall, that it be not burnt so soon as it is put into the ground, & therefore immediatly it must be couered with mould. If the soile be moist and giuen to bear other grasse, the seed is soon ouergrown and choked, and then al wil run to grasse, & turn to be a meadow: which grasse or coich when you see begin to ouerrun the ground, it must be all weeded out presently an inch deepe within the ground, and by hand rather than any weeding-hooke or thistle spade. Now, when this hearbe Medica or Clauer grasse begins once to floure cut it downe: and so often as it floureth againe, downe with it. Thus you may haue six mathes in one yere or four at the least. You must neuer let it spindie and beare seed: for better is it to take it thus in the growth, while it is but young and greene grasse, for three yeares together: and the forrage or fodder is most profitfull. Sowne (I say) it must be in the Spring, and weeded for the first three yeares. The green sward afterwards ought to be pared away with hookes and spades close to the ground: for by this meanes you shall be sure, that all other weeds will die, and this hearbe take no harme by it, for that by this time it is deeply rooted. If the weeds do get head and overcome it, the onely remedie is by the plough, to turne vp the ground ouer and ouer so many times, vntill all other roots be killed. Moreouer, heed must be taken, that of this herbage or fodder, beasts do not eat their fil; for feare you be driuen of necessitie to let them bloud, and take downe their rankenesse. The greener that it is, the more profit commeth thereof, for it drieth branch after branch, vntill at length it will crumble like dust or powder, and then is it good for nothing.

As touching Cytisus, [i. the Shrub Trifoile] which is a singular kind of pasturage, & passes al the rest, I haue written at ful in my discourse of shrubs. For now at this present I am to prosecute

* Or rather

nerat.

cure and goe through the treatise of other sorts of corne and their nature, if I had once written somewhat in one part thereof as touching the accidents and imperfections that happen among them.

CHAP. XVII.

¶ The faults incident to corne, and their remedies. Also what corne is respectiue to this or that soile, for to be sown therein.

The first and principall defect obserued in bread-corne, and Wheat especially, is when it doth degenerate and turne into Otes: and not only it, but Barley also doth the like. Semblably, Otes otherwhiles serue the turne in stead of bread-corne: as wee may see in some countries of Almaine, where they do vsually sow it, and commonly they haue no other pottage there, than Oatmeale gruell [which they call Abremouz.] The foresaid defect and imperfection is occasioned chiefly by the moist soile or ouerwet weather. Another cause there followeth also thereupon, proceeding from the feeblenesse and weaknesse of the seed; namely, when it lieth long fobbing in the ground, before it come vp: and hereto may be referred the faultines of the seed otherwise, namely, if it were worm-eaten or otherwise rotten at the time of sowing: and verily, no sooner appeareth it aboue ground, but the foresaid change or bastardie may be seene, whereby it doth appeare, that the cause is in the root.

A second defect or imperfection there is also incident to corn, which hath some neer resemblance to the Otes aforesaid, namely, when the graine being formed and newly come to the iust proportion of bignesse (howbeit, not yet full and ripe) before that it is firm and hard, is smitten with a noisome blast, and so, like an abortiue fruit, decaieth and windereth away within the eare in such sort, as there is no substance left therein, but appeareth void and emptie. Now these aduerse and malignant winds hurt all spiked corne, as well Wheat as Barley, at three seuerall times, to wit, in their floure; presently vpon their blooming, and last of all, when they begin to ripen; for then, namely when they are vpon the point of maturitie, those blasts consume the grain, and bring it to nothing, which before was full: whereas at the two former seasons they hinder it altogether from knitting and growing. The hot gleames moreouer of the Sun, betweene often clouding, do much harme to corne.

Furthermore, there be certaine little wormes breeding in the root, that do eat it: which happeneth by occasion of much raine falling immediatly after the seednesse, especially, when some sudden heat and drowth ensueth therupon, which bindeth the earth aboue and so encloseth the moisture conceiued within, the very cause & nourice of putrifaction. Ye shall haue other such like vermin engender likewise in the very grain of the corn, namely, when the ear doth glow within, and is chafed with sultry hot rains.ouer and besides, there be certain [green] flies like small Beerles, called Cantharides, which do gnaw and eat the corne. But al these, and such like worms or flies die presently, when the corn (which was their food) is gone. Moreouer, Oile, Pitch, and Tarre, al manner of greace also, be contrarie to seed-corne especially; and therefore take heed that at you sow none such as hath caught oile, pitch, or greace. As for showers of raine, good they are for corne, so long only as it is in the green blade: when corne is blooming, be it either wheat or barley, or such like) raine is hurtfull. Mary Pulse takes no harme thereby, vnlesse it be the Cich-peafe.

All kinds of wheat and other bread corne, when they be toward ripenesse, catch hurt by showers, but Barley more than any. Besides all this, there is a certaine white hearbe or weed resembling Panicke, growing among corne, and ouerspreading whole fields; which not onely hindereth corne, but also killeth all the cattell that feedeth thereupon. For as touching ray or darnel, burs, thistles, and brambles, I may hold and reckon them, not so much for faults and imperfections of corn, as rather the plagues and infections proceeding from the very earth. And for blasting, which commeth of some distemperature of the aire (a mischief common as well to corn, as vines) it is as hurtful as any other malady whatsoever. This vnhappy blast falleth most often in places subject to mists and dewes, and namely, hollow vallies and low grounds lying vnder the winde: for contrariwise, windie quarters, and such as are mounted high, are not subiect to this inconuenience. Also we may number among the faults incident to corne, their rankenesse; namely, when the blade is so ouergrowne, and the stalke so charged and loden with a heauie head that the corn standeth not vpriight, but is lodged & lieth along. Moreouer, when there falls a great

A a great glut of rain, in so much as the ground stands with water, there befallerth vnto all corn and pulse, yea, and whatsoeuer is sowne, a certaine disease called in Latine Vrica; in so much, as the very Cich-peafe taketh hurt thereby, for by reason that the rain washed from them that salt quality which was naturall thereunto, it becometh sweeter than it should be, and loseth the kind tast. There is a weed that claspeth and tieth about Ciches and Eruiles, whereby it chokereth and killeth them both: and thereupon it is called Orobanthum, i. Choke Eruiile. After the same manner dealeth * Ray or Darnel by wheat; wild Otes likewise, named by some Agilops, with barley; as also the weed Securidaca, i. Ax-fitch, which the Greeks also (for the resemblance that it hath to an axe head) call Pelicinin, * with Lentils. These weeds (I say) kill corne by winding about it. Another herb there is, growing neere to the city Philippi, which killeth Beans: if the ground be fat and good, they name the said weed Ateramnion; but if it be found in a hungry and leane soile, and namely, when being wet, some vnhappy wind bloweth vpon it, they call it Teramnion. As for the graine of Raie or Darnel, it is very small, and lieth inclosed with a sharpe-pointed husk. The bread which hath any of this seed in it, soone causeth dizinesse and swimming of the head. And (by report) in Asia and Greece the matters of the common Bains and Stuphes, when they would keep away the great resort of multitude thither, haue a deuise to cast Darnell seeds vpon burning coles, for this perfume will quickly set them farther off. Moreouer, if the Winter proue to be wet and waterish, ye shall haue in the Pulse called Eruiile, a little vermin ingendred there called Phalangin, and it is of the kind of these spiders. Likewise vpon Vetches there will breed naked dew-snails, yea, & otherwhile those little ones with shells or houses on their backs, which creeping from the ground, will gnaw & eat them, that it is a wonder to see what foul work they will make. Thus much concerning all the remedies and inconueniences (to speak of) incident to corne. It remaineth now to treat of the remedies.

As touching the cure of those harms that come by hurtful weeds to the corn in blade, it consisteth principally in two things: namely, either in the vse of the weeding knife or hooke, when they be newly come vp, or els in strewing ashes when the corn is a sowing. But as for those dangers that touch the seed or grain in the eare and eod, as also that settle about the root, they must be preuented by good forecast, euen before it be thrown into the ground. It is generally thought that if seed-corn lie steeped beforehand in Wine, it will be better able afterwards to resist all diseases whatsoever. Virgil giueth order to infuse or soke the Beanes that must be sown, in nitre and oile lees or dregs; and he assureth vs, that they will prosper mightily besides, and become exceeding great. But others are of opinion, that if for 3 daies before they be cast into the earth they lie in vrine & there water mingled together, they will, being thus prepared come on apace, and thrive passing well. It is said moreouer, That if Beans be thrice raked and rid from weedes, one Modius of them being whole and solid, will yeeld a Modius again after it is husked & broken. As for other seed-corn, it will escape the danger of the worme, if either it lie before among Cypresse leaues bruised, or be sowed in and about the change of the Moon, namely, when she is not to be seen about the earth in our hemisphere. Many there be who practise other remedies: & namely for the Millet, they would haue a toad to be caried round about the field before that it be harrowed: which done, to be put close within an earthen pot, and so buried in the middest of the said field: and by this meanes forsooth, neither Sparrows will lie vpon the corn, nor any worm hurt it. Mary, in any case this same toad must be digged out of the ground againe before the field be mowed, els will the Millet proue bitter in tast. The like experiment they say is of a Moldwarps shoulder, for if any corn be sowed or touched therewith before, it will come vp the better and bring more increase. Democritus had a deuise by himselfe for all seed & corn whatsoever, namely, to temper & soke the same corn in the iuice of the herb houselecke or Sen-green, growing vpon houses either tiled or shindled, which in Greeke is called Aizoon, and in Latine Sedum or Digitellum; for this medicine will serue for all maladies. The common practise of our husbandmen is this: in case through the ouersweet sap or iuice in Greene corne, wormes take to the roots: for to sprinkle them with simple oile lees pure and cleane without any salt, & afterwards to rake it in. Also, when the corn begins to ioint and gather into knots, then to cleanse the ground, and put off no longer, for feare lest the weeds do get head & ouergrow. This I am sure vpon mine owne knowledge, that there is an herbe (but what proper name it hath I wote not) which if it be interred in the foure corners of a field that is sown with Millet, it will drive away Stares and Sparrows, which otherwise would by whole flights and flocks lie thereupon and do much

much harme; nay I will speake a greater word and which may seeme wonderfull, There is not a G
bird of the aire one or other, that dare enter or approach such a field. Field-mice and Rats are
skared away and will not touch corne, which before the sowing was either bestrewed with the
ashes of weasels or cats, or els drenched with the liquor and decoction of water wherein they
were boiled; howbeit this inconuenience insueth hereupon. That bread made of such corn will
haue a sinach, and sent strongly of such cats and Weasels: and therefore it is supposed a more
expedient and safer way to medicine our seed corne with oxgall, for to preferue it from the
said Mice and Rats. But what remedy against the blast and mildew, the greatest plague that can
befall vpon corn? Mary prick downe certaine Lawrell boughes here and there among the stand-
ing corne, all the said mists and mildewes will leaue the corne and passe to the Bay leaues, and
there settle. What shall we do then to corne when it is ouer-rank? Eat it me downe with sheep H
and spare not, whiles it is young and in the blade onely, before (1 day) it be knotted: and neuer
feare harm by the sheeps teeth as neere as they go to the ground: for let it be thus eaten many
times, the corn will be the better, yea and the head will take no harme thereby but prooue the
fairer. If such rank corne be once cut down with the syth, & no more, certain it is that the grain
in the eare will be the longer to see to, howbeit void and without any flour within it; for sowing
such seed again, & it wil neuer grow nor come vp. And yet about Babylon, the maner is to mow
it twise first, and the third time to put in sheep to it for to eat it down; otherwise the corn would
neuer spindle, but blade still, and run all to leafe. But being thus cut and cut again, and eaten in
the end, ye shall haue it to increase and multiply 50 for one, * so fertile is the soile: and if the
owner be a good husband besides, and vse the ground accordingly, he shall reap thrice as much, I
euen a 150 fold. And what carefull diligence is that which is here required? Surely neither
much, nor difficult: only he must be sure to keep the ground well with watering for a long time
together, to the end that it may be discharged of the ouermuch fat within it, which by this
means will be washed all away, and the ranknesse delaied. Yet as rich and fertile as this soile is,
the two riuers Euphrates and Tigris (which vse to ouerflow and water the country) bring no sli-
my mud with them, as Nilus doth in Egypt, wherby the ground is made so fat as it is: neither is
the nature of the earth there, giuen to breed herbs that it should need any weeding: and yet so
plenteous and fruitfull it is, that it soweth it selfe against the next yere, for the corne that shed-
deth in the reaping and mowing, being troden vnder foot into the ground, is as good as a sow-
ing, and riseth of it selfe without any further labor.

* Felicitas soli

Seeing then there is so great difference in the soile, I am put in minde thereby to fit euery
ground with seed respectiue, according to the nature and goodnesse thereof. This therefore is
the opinion of *Cato*, that in a grosse and fat soile, there would be wheat and such like hard corne
sown; and if the same be subiect also to mists and dewes, there may be sown therein raddish, mil-
let, and Panick, must be sowne first in a cold and waterish ground; and afterwards for change in
a hot soile. *Item*, the red bearded wheat *Far* or *Adoreum*, requireth a chalkie and sandy ground,
and namely if it be well watered. *Item*, the common wheat loueth a drie soile, exposed to the
Sun, and not giuen much to breed superfluous weeds. *Item*, Beanes will doe well in a found and
fast soile. As for Vetches, they care not how little they be sowed in a moist piece of ground, and
such as is apt to run to grasse. Moreover, for the fine winter wheat *Siligo*, whereof the best man-
chet is made, and also for the common frumenty wheat, there would be chosen an open & high
ground, lying pleasantly vpon the Sunne, that it might haue the heat thereof to parch it as long
and as much as is possible. As for Lentils, they doe like a good rough and shrubbie soile, full of
red earth, so as it be not apt quickly to gather a green-ford. * Barly would gladly grow vpon a re-
stie ground new broken vp, or else such as be in heart to beare euery yere. And as for Summer
(barley) of three moneths, it would be sowne in a ground where it could not haue an earely or
timely Seednes, & which is so fat and rich, as it may afford to beare crop, yere by yere: finally,
to speak to the purpose indeed, this also is *Catoes* witty resolution in one word for all: if the soile
be light and lean, seed it with such grain or forage seed, as require no great nourishment, as for
example, with *Cytisus*; and excepting the *Cich-pease*, with all pulse that are vsed to be plucked
out of the earth, and not mowed downe: and thereupon indeed are these pulse called in Latine
Legumina, because they are plucked and gathered in that sort: but in case the ground be good
and fat, sow such things as require fuller food and nutriment; and namely, all garden worts and
pot-herbes; wheat, both the common and the fine; and Linfeed. Then, according to this rule, a
leane

* *in rebus
vitiis s. exult.
Plutarch.*

A leane and hungry soile will well agree with barly, for the root is contented with lesse nutriture:
wheras contrariwise we allow both lighter, and also more massie and richer ground for our ordi-
nary wheat. In a low and wet piece of ground, it is good to sow the red wheat *Adoreum*, rather
than the common wheat *Triticum*: but both it and barley will sort well with a soile of a mid-
dle temperature. The hills yeeld a firm, fast, and strong kind of wheat, but the grain is but smal.
And to conclude, the best kinds of wheat, to wit, *Far* and *Siligo*, challenge for their lot to bee
seated in a chalky soile, and therewith alwaies wet and soaked in water.

CHAP. XVIII.

B Offspring prodigies and wonders obserued in corne: the knowledge and skill of earing
and tilling the ground: also diuers sorts of plough-shares.

A I be it haue in the title of this chapter purposed to write of prodigies seen in corne, yet
to my knowledge, there neuer happened but once the like wonder and portentious sight
to this which I shall tell, and which befell in the time that *P. Aelius* and *Cn. Cornelius* were
Consuls of Rome, that very yere wherein *Annibal* with his whole armie was defeated and van-
quished: for then (by report) there was corne grew vpon trees.
But forasmuch as I haue discoursed at large of the sundry kinds as well of corn as of ground,
I will proceed now forward and come to the manner of ploughing the earth, after I haue first
set downe before all things els, how easie the husbandrie is in Egypt: for there the riuier Nilus
seruing in stead of a good plough man, beginneth to swell and ouerflow (as we haue before rehear-
sed) at the first new Moone after the Summer Sunstead. Hee beginneth faire and softly, and so
increaseth more and more by little and little; but all the while that the Sun passeth vnder the
signe Leo, hee higheth apace vntill hee be risen to his full height: being entered once into Virgo,
his fury slaketh, then decreaseth he as fast, vntill hee be fallen againe into his wonted channell,
which ordinarily happeneth by the time that the Sun is in Libra. Now this is obserued, That if
he rise not plumb about 12 cubits high, the people are sure to haue a famine of corn that yere:
the like also do they make account of, in case hee passe the gage of sixteen cubits: for the higher
that he is risen, the longer it is again ere he be fully fallen, by which time the Seednesse is past,
and men cannot sow the ground in due season. It hath bin generally receiued for a truth, That
D presently vpon the departure of this deluge and ouerflowing of Nilus, they were wont to cast
their seed-corne vpon the floten ground, and presently let in their swine after for to trample it
with their feet into the earth whiles it was soft and drenched. And verily, for mine owne part, I
beleue wel, they vsed so to do in old time: for euen now adaies also, much more ado they make
not about it. Howbeit, this is certaine, that first they cast their seed vpon the slime and mud so
soone as the riuier is downe, which commonly falleth out in the very beginning of Nouember:
which done, they go ouer it with the plough and giue it a light tith, so as it may be couered on-
ly and lie vnder a small furrow. Some few there be that afterwards fall a weeding, which point
of husbandry they call *Boranismos*: but the most part, after they haue once sowed and turned
their seed into the ground, neuer after make a step into field to see how their corne groweth, vn-
til they go once for all with syth on neck or sickle in hand, namely at the end of March; for then
they fall to reaping and cutting it downe, so as by the moneth of May they sing in Egypt, Har-
uest in, and all is done for that yere. As touching this corne gathered in Base Egypt, the straw
is neuer a cubit long: the reason is, because the seed lieth very ebbe, and hath no other nutri-
ment than from the mud and slime aforesaid; for vnder it is nothing but sand and grauell. But
those that inhabit higher vp into the country, namely about Thebais, they be far better prouid-
ed for corne, because Egypt indeed (for the most part) lyeth low vpon marais ground. Toward
Babylon likewise and Seleucia (where the riuers Euphrates and Tigris doe swell ouer their
banks and water the country) the same husbandry is practised, but to better effect and greater
profit, by reason that the people may let in the water at sluices and flood-gates, more or lesse
with their owne hands, according as they list themselves. Also in Syria, they haue their small
ploughs for the nones to take a shallow stich and make light worke: whereas in many places
here with vs in Italy, eight oxen are little enough to euery plough, and to go away withall they
must labor at it till they blow and pant again. It is an old said Saw, and may goe for an Oracle
to be practised in all parts of husbandry, but in this point of ploughing especially, *See ruled by*
D d d the

the nature of euery countrey, and see what each ground will abide. To come now vnto our ploughes. Of Shares, there be many sorts: first, there is that instrument called a culter, which serueth to make way before, cutting and cleauing the hard and thick ground as it goeth, before it be broken vp and turned aroneside: this sheweth by the flits and incisions that it maketh (as it were by a true line drawn) how the furrows shall go; after which cometh the broad bit of the ploughshare indeed, lying flat-wile, and in earing casteth vp all before it, and cleareth the furrow. A second sort there is, commonly vied in many places, and it is no more but a bar of yron pointed sharpe in manner of a beak-head or stem of a ship; and it may be called a Rostle. And when the ground is not stubborn but gentle to be wrought, there is a third kind vied, which is nothing but a piece of yron not reaching all ouer the * plough head and shooing it to the full, but turning vp like a snout with a small point sharp at the end. This nee is somewhat broader in a fourth kinde of shares, but as it is broader in blade and trenchant withall, so it is sharper also at the end; inso-much, that both with the point forward & the edges of the sides, it not only pierces the ground before it pointant like a sword, but also cutteth the roots of weeds which it incountrith: a deuise inuented not long since in Rhætia. As for the Gaules, they set too besides, certain small roundles or wheels; & a plough thus shod & harnaised, they call in their language * Planarati: the head of their share is broad, fashioned like vnto the bit of a spade: and thus they sow their grounds for the most part, new broken vp and not tilled nor eared before. And for that their plough-shares be large and broad, so much the easier turn they vp good turfs of earth and make broad furrows. Presently after the plough, they throw in their seed, and mould or couer it afterwards with yron-toothed harrows drawn aloft. Lands in this manner sown, need no other raking or weeding; for commonly they make not past two or three bouts in a land, and as many ridges. Finally, it is thought, that in this manner there may be sown in one yere by the help of one yoke of oxen, 40 arpens or acres of land ordinarily; if the ground be gentle and easie to be eared; but if it be stiffe and stubborne, they shall haue worke enough to go through thirty.

CHAP. XIX.

¶ The seasons that be proper for tilling the ground: also the manner of coupling oxen in yoke.

IN this operation of ploughing ground, I am of mind to follow that Oracle or Aphorisme of Cato, who being asked which was the first and principall point of Agriculture, answered thus, *Euen to husband, order, and tend ground well*: being demanded againe, what was the second, hee made answer, *To plough well*. And when the question was propounded concerning the third point of husbandry, he said, *That it consisted in manuring and dunging it well*. There be other necessarie rules besides, set downe by him as touching this matter; namely, Make no vnequall furrowes in ploughing, but lay them alike with one and the same plough. Passe not the kindly season, but eare the ground in due time. In the warmer countries, lands would be broken vp and fallowes made, immediately after the Winter Solstice or Sun-stead. In colder regions, touch them not before the spring Equinox or Mid-march. In a drie quarter, plough more early than in a moist: sooner also in a fast and compact soile, than in a loose and light ground: in a fat and rich field, than in a leane and poore land. Looke in what climat the Summer is ordinarily drie and hot, it is thought more profitable to eare vp a chalky or a light and leane ground, between the Summer Sunstead and the Equinoctiall in the fall of the lease. If the climat be such as yeeldeth but little heat in Summer, and therewith many showers of raine, where the soile also is fat and beareth a thick green-sourd, it were better to break vp ground and fallow in the hottest season: where the soile is heauie, grosse, and fat, and wherein a man may tread deepe, I like well that it should be tilled and stirred in winter: but in case it be very light and drie withall, it would not be medled with but a little before * seednes. Here also be other proper rules set down by Cato, pertinent to Agriculture: Touch not (qd. he) in any hand a piece of ground that soon will turne to dust and mire. When thou dost plough indeed for to sow, employ thy whole strength thereto: but before thou take a deep stich for all, giue it a pin-fallow before; this commodity cometh thereof, that by turning vp the turfe with the bottom vpward, the roots of weeds are killed. Some are of this opinion, that howsoeuer we do els, a ground should haue the first braking vp about the spring Equinox: a land that thus hath bin once plowed in the spring, is called in Latin *Veracium*, & hath the name of the foresaid time *Ver* [i. spring.] Indeed ley grounds & such as

* Dentalis.

* or as some think, *Pfluggradi*.

* Bene colere.

* Bene arare.

* Bene sercare.

* In the spring

A rest each other yere, must be in this wise followed. Now if you would know what the Latines mean by *Nonale*, they take it for a field sowed euery second yere. And thus much of the land.

To come now vnto our draught oxen that must labour at the plough: they ought to be coupled in yoke, as close together & as streight as is possible, to the end that whilst they be at work and ploughing, they may beare vp their heads; for by that meanes they least doe gall or bruise their necks. If they chance to goe to plough among trees and vines, they must be muzzled with some frailes or deuises made of twigs, to the end they should not brouse and crop off the yong springs and soft tendrils. Moreover, there ought a little hatchet to hang euermore fast to the plough beame before, therewith to cut through roots within the ground, that might breake or stay the plough: for better is it so to do, than to put the plough to it, to keep a plucking at them or to force the poore oxen to lie tugging & wrestling with them. Also in ploughing, this order

is to be kept, That when the oxen are * gone down with one furrow to the lands end, they turne and goe vp againe with another; so that in ploughing of a land they * rest betweene whiles as little as may be, but euermore go forward in their labour vntill they haue made an end of their * halfe acre, or halfe daies worke: and verily it is thought sufficient for a teem of oxen to breake vp (at the first tith) in one day of restie or ley ground, one acre, taking a furrow or stich of nine inches; but at the second tith or stirring, an acre and a halfe; which is to be vnderstood of an easie and mellow soile to be wrought, for if it be tough and churlish, it is wel if they eare vp at the first, halfe an acre; and at the next time they may go through with one whole acre, how hard soeuer the ground be; for thus haue poore beasts their taske set, and their labour limited by Natures lore and appointment. Euery field to be sown must be eared at first with streight & direct furrows; but those that follow after, ought to go byas and winding. If a ground vpon the pendant or hanging of the hill be to be broken vp, the furrowes must go crosse and ouerthwart: howbeit, the point and beak of the plough-share must be so guided, that one while it beare hard above on the one side, and another while beneath on the other side: and verily in this mountaine worke, the ploughman that holdeth the plough hath toile enough, and laboreth at it as hard as the oxen do. Certes, there be some mountaines that haue no vse at all of this beast, but they eare their ground with raking and scraping hooks only. The ploughman, vnlesse he bend and stoop forward with his body, must needs make sleight worke, and leaue much vndon as it ought to be; a fault which in Latine we call *Preuarication*: and this terme appropriate vnto husbandrie, is

borrowed from thence by Lawyers, and translated by them into their courts and halls of pleas: if it be then a reprochfull crime for Lawyers to abuse their clients by way of collusion, wee ought to take heed how we deceiue and mocke the ground, where this fault was first found and discovered. To proceed, the plough-man euermore and anone had need to cleanse the culter and the share with his staffe, tipped and pointed at the end like a thistle-spade: he must beware that between two furrowes, he leaue no naked balks raw and vntilled: also that the clots ride not one vpon anothers back. Badly is that land ploughed, which after the corn is sowed, needs the great harrows and clotting. Contrariwise, a man may know where there is good worke; namely, if the turfe be so close couched that there be no seams to be seen where the plough-share went: finally, it is a profitable point of husbandry and much practised (where the ground doth both beare and require it) For to draw here and there broad gutters or furrows, to drain away the water into ditches and trenches cast for the nones betweene the lands, that otherwise would stand within and drowne the corne.

CHAP. XX.

¶ Of harrowing and breaking clods. Of a certaine kind of ploughing vied in old time. Of the second tith or fallow called *Stirring*: and of cutting.

AFTER the second fallow called *Stirring*, done with crosse and ouerthwart furrow to the first, then followeth clodding, if need be, either with rakes or great harrowes: vpon which inso-much sowing; and when the seed is in the ground, harrowing a second time with the small harrow. In some places, where the manner of the country doth so require, this is performed with a tined or toothed harrow, or els with a broad planke fastened vnto the plough taile, which doth hide and couer the seed newly sown; and in this maner to rake or harrow, is called in Latine *Lirare*, from whence came first the word *Delirare*, which is to leaue bare balks vncouered, and by a Metaphore and borrowed speech, to rane and speake idly.

downe.

It should seem that *Virgil prescribed, that the ground should haue foure tilthes in all, by these words, when he said, That the corne was best, which had two Summers and two Winters. But if the ground be strong and tough, as in most parts of Italy, there needs a * fift tilth before sowing, and in Tuscan verily they giue their ground, otherwhiles no fewer than nine fallowes, before it be brought into tillage. As for Beans and Vetches, they may be sowed vnder furrow, without breaking vp the ground before; for this is a ready way, gaining time, sauing charges, & sparing labour.

And here I cannot ouerpasse one inuention more as touching earing and ploughing the ground, deuised in Piemont and those parts beyond the Po, by occasion of some hard measure and wrong offered to the people and peisants of that country during the wars. And thus stood the case. The Salassians making rodes into the vale lying vnder the Alpes, as they forraied and harried the country all ouer, assailed also to ouerrun their fields of Panick and Millet being now come vp and wel growne, meaning thereby to destroy it; but seeing the nature of that graine to be such, as to rise againe and to check this iniury, they set ploughs into it, and turned all vnder furrow, imagining by that means to spoil it for euer. But fel what ensued therupon; those fields thus misused (in their conceit) bare a twofold crop, in proportion to other yerres; & yeelded so plentiful an harvest, as that thereby the peisants aforesaid learned the deuise of turning corn in the blade into the ground, which I suppose in those days when it new came vp, they called *Ara-rrare*. And this point of husbandry they put in practise, when the corne begins to gather and shew the stem or straw; to wit, so soone as it hath put forth two or three leaues and no more.

Neither will I conceale from you another new deuise, practised and inuented first, not above three yerres past in the territory of Treuiers, neer to Ferrara. For at what time as their corn fields by reason of an extreme cold winter, seemed to be frost-bitten and spoiled, they sowed the same again in the month of March, raking and scraping the vpper coat of the ground onely without more ado: and neuer in their liues had they the like increase when harvest came. Now as touching all other tillage and husbandry meet for the ground, I will write thereof respectfully to the seuerall kinds of corne.

CHAP. XXI.

¶ Of the tillage and ordering of the ground.

The fine Wheat Siligo, the red bearded Wheat Far, and the common Wheat Triticum; Spelt or Zea (generally called Seed) and Barly, when they be new sown, would be wel clotted and couered first, harrowed afterwards, & weeded at the last to the very root; al at such seasons as shall be shewed hereafter. And to say a truth, every one of these is a sufficient worke for one man to do in a day throughout an acre. As for the Sarceling or second harrowing, it doth much good to corn: for by loosening the ground about it, which by the winter cold was hardened, clunged, and (as it were) hide bound, it is somewhat enlarged and at libertie against the Spring tide, and full gladly admitteth and receiueth the benefit of the fresh and new come Sunshine daies: let him take heed who thus sarches or rakes the ground, that he neither vndermine the roots of the corn, nor yet race or disquiet & loosen them. The common wheat, Barley, the Seed Zea (i. Spelt) and Beans, would do the better if they were thus sarched, and the earth laied loose about them twice: the grubbing vp of weeds by the root, at what time as the corne is ioined (namely, when the vnprofitable and hurtful hearbs are plucked forth and rid out of the way) much helpeth the root of the corn, discharging it from noisome weeds, procuring it more nutriment and seuering it apart from the other green sould of common grasse. Of all Pulse, the cich pease askech the same dressing and ordering, as the red wheat Far. As for beans, they passe not at all for weeding; and why: they ouergrow all the weeds about, and choke them. The Lupines require nought els to be done to them but only weeding. Millet and Panick, must be clotted and once harrowed vntill they be couered: they call not for a second raking & scraping about them, for to loosen the earth, and to lay fresh mould vnto them; much lesse to be weeded. As for Silicia or Siliqua, i. * Fenigreeke, and Fasels, i. Kidney-beans, they care onely for clodding, & there an end.

Moreover, there be certain grounds so fertile, that the corn comming vp so thick & ranke in the blade, ought then to be kemberd (as it were) & raked with a kind of harrow set with teeth or spikes

* For so he in-
re mereth at
h-helfe n the
hap of this
booke.

A spikes of yron: and yet for all this, they must be grafted or eaten down besides neuerthelesse with sheep. Now we must remember, that after such cattel hath gon ouer it with their teeth, the same corne thus eaten downe, must of necessity be sarched, and the earth lightly raked and raised vp fresh againe. Howbeit, in Baetiana, Africke, and Cyrene, there needs no such hand at all: for the climate is so good, so kinde, and beneficiall, that none of all this paines is required: for after the seed is once sowne, they neuer visit it but once for all at nine months end, at what time they returne to cut it down and lay it vpon their thrashing floores: the reason is, because the drought keepeth downe all weeds; and the dewes that fall by night, are sufficient to refresh and nourish the corne.

Virgil is of opinion, That fallowes would be made euery yeare, and that our corn field should rest betwene whiles, and beare but each other yere. And surely, I doe find this rule of his most true, and doubtlesse right profitable; in case a man haue land enough for to let his grounds play them, and rest euery second yere. But how if a man is streighted that way, and hath no such reach and circuit lying to his liuing? Let him help himselfe this way: let him (I say) sow his good red wheat Far againe the next yere, vpon that ground from whence he gathered this yeare a crop of Lupines, Vetches, or Beans, or some such grain as doth enrich and muck the ground. For this also is principally to be noted, that some corne is sowne for no other purpose, but by the way as it were to aduance and help others to fructifie: howbeit, small fruit and increase (to speak of) ariseth thereby, as I haue obserued once for all in the booke immediatly going before, because I would not willingly reiterate and inculcate one thing often. For herein regard especially ought to be had, vnto the nature and property of euery soile.

CHAP. XXII.

¶ Of certaine countries exceeding fertile and fruitfull. Of a Vine bearing grapes twise in one yeare. Of the difference and diuersitie obserued in waters.

There is in Africke or Barbary a city called Tacape, scituate in the midst of the sands, as men go to the Syrtes and Leptis the great: the territory lying about which city, by reason that it is so well watered, is maruellous fruitfull, and indeed passeth a wonder and is incredible. Within this tract there is a fountain, which serueth abundantly for three miles well neer, every way; the head thereof verily is large enough otherwise, howbeit the inhabitants about it are serued with water from thence by turns, and dispensed it is among them at certain set hours, and not otherwise. There standeth there a mighty great date-tree, hauing vnder it growing an oliue, vnder which there is a fig-tree, and that ouerspreadeth a Pomegranat tree, vnder the shade whereof there is a Vine: and vnder the compasse thereof, first they sow Frument or eared corne, after that Pulse, and then worts and herbs for the pot, all in one and the same yere. Euery one of these reharfed, liue, joy, and thriue vnder the shade of others. Euery foure cubits square of this soile (taking the measure of a cubit from the elbow, not to the fingers ends stretched out in length, but clasped together into the fist) is sold for * 4 deniers Roman: but this one surpasseth all the rest. The vines in the said territory beare twice a yeare, and yeeld their grapes ripe for a double Vintage. So exceeding fruitfull is the soile, that vnlesse the ranknesse thereof were abated and taken downe, by bearing sundry fruits one vnder and after another, so that it were imployed to one thing alone, the inhabitants should neuer haue any good thereof: for by reason of the ouer-ranknesse, each seuerall fruit would perish and come to nought: but now by means of plying and following it still with seed, a man shall gather one fruit or other ripe, all the yeare long. And for certaine it is knowne, that men cannot ouercharge the ground, no nor feed the fertilitye of it sufficiently.

Moreover, all kinds of water are not of like nature nor of equall goodnesse, for to drench and refresh the ground. In the prouince of Narbon, now Languedoc, there is a famous wel or fountain named Orge, within the very head whereof there grow certaine herbes, so much desired and sought for by kine and oxen, that to seeke and get a mouthfull of them, they will thrust in their whole heads ouer their eares, vntill they meet therewith: but howfoeuer these herbes seeme to spring & grow within the water, certain it is, that nourished they are not, but by rain from aboue. And therefore to conclude & knit vp all in one word, Let euery man be wel acquainted with the nature both of his own land which he hath, and also of the water wherewith he is serued.

CHAP. XXIII.

¶ *Of the diuers qualities of the soile. Also, the manner of dunging or manuring grounds.*

IF you meet with a ground of your owne, which we called heretofore by the name of Tenera, the soile indeed and principall of all others; after you haue taken off a crop of Barley, you may very well sow Millet thereupon: and when that is in and laid vp in the barne, proceed to Raddish. Last of all, after they be drawne, there may be barley or common wheat sowed in the place, like as they do in Campaine; for surely such a piece of ground needs no other tillage, but often sowing. Another order there is besides this in sowing of such soile; namely, that where there grew the red wheat Adoreum or Far, there the ground should rest all the four winter moneths, and in the Spring be sowed again with Beans, so that it alwaies be imploied and kept occupied vntill Winter without any intermission. And say that the ground be not altogether so fat, yet it may be ordered so, that it be euer bearing by turns in this sort, that after the Frumenty or Spike corne be taken off, there be pulse sowne three times, one after another. But in case the ground be ouer poore and lean, it must be suffered to rest and take repose two yeares in three. Moreover, many husbandmen do hold, that it is not good to sow white corne or Frument vpon any land, but such as lay fallow and rested the yeare before.

Howeuer it be, the principall thing in this part of Agriculture, consisteth in dunging, whereof I haue written already in the former book next to this. This one point only is resolved vpon by all men, that none of our grounds ought to be sowed, vnlesse they be manured and mucked before. And yet herein must we be directed by certain rules peculiar and proper thereunto, as follow. Millet, Panick, Rapes, Turneps, or Navews, ought neuer to be sowed but in a ground that is dunged. If there be no compost laid vpon a ground, sow vpon it Frument or bread-corne, rather than Barley. Likewise in grounds that rest and lie fallow euery other yeare, albeit in all mens opinion, they are thought good for to beare Beans, yet notwithstanding Beans loue better where-soeuer they come to be sowed in a ground but newly mucked. He that mindeth to sow at the fall of the leafe, must in the month of September before, spread his dung, turn it in with the plough, and so incorporate it with the soile presently after a shower of rain: euen so also, if a man purpose to sow in the spring, let him in the winter time dispose of his mucke vpon the lands and spread it. The ordinary proportion is, to lay 18 tumbrels or loads thereof vpon euery acre. Throwne abroad it must be also before it be dried, and ere you sow, or els so soone as the seede is in the ground, that it may be harrowed in with the corne. But in case this manner of dunging be neglected, it followeth then before that you do harrow, to strew the short small dung in manner of dust gathered out of Coupes, Mues, and Bartons, where foule are fed; or els to cast Goats tred-dles vpon the land, as if you would sow seed, and then with rakes and harrowes to mingle it with the soile.

To the end now that we may determine fully as touching this care also, belonging to dung, euery sheep or goat and such small cattell, should by right yeeld ordinarily in dung one load in ten daies: and euery head of bigger beafts ten load; for vnlesse this proportion and quantity of muck be gathered, plain it is, that the granger or master of husbandry, hath not don his part, but failed in liting of his cattell. Some hold opinion, that the best way of mucking a land is, to fold sheep and such like small cattell thereupon, euen in the broad open field; and to this purpose they inclose or impark them within hurdles. In a word, a ground not dunged at all, groweth to be cold; and again if it be ouermuch dunged, the heart thereof is burned away. And therefore the better and safer way is to muck by little at once and often, rather than to ouerdo it at once. The hotter that a soile is, it stands by good reason, that the lesse compost it requireth.

CHAP. XXIII.

¶ *Of good seed-corne. The manner of sowing ground well. How much seed of euery kind of graine an acre will take. The due seasons of Seedtime.*

THe best corne or Zea for seede, is of one yeares age, two yeares old is not so good: that of three, is worst of all: for Leyond that time, the heart is dead, and such corne wil neuer spurt.

And

A And verily this that is said of one sort may be verified of all kinds. The corne that setteth to the bottome of the mowh in a barn toward the floore, is euer to be reserved for seed. And that must needs be best, because it is weightiest, for therein lieth the goodnesse: neither is there a better way to discern and distinguish good corn from other. If you see an eare of corn hauing grains in it here and there staring distant asunder, be sure the corn is not good for this purpose; and therefore it must be cast aside. The best graine looketh reddish, and being broken between ones teeth, retaineth still the same colour within: the worse corn for seed is that which sheweth more of the white flower within.

Furthermore, this is certain, that some grounds take more seed, and some lesse. And hereby verily do husbandmen gather their first presage religiously, of a good or bad haruest; for when they see the ground swallow more seed than ordinary, they haue a ceremonie to say & beleue that it is hungry, and hath greedily eaten the seed. When a man is to sow a moist ground, good reason there is to make the quicker dispatch, and to do it betimes, for fear lest rain come to rot it. But contrariwise in dry places it is not amisse to stay the later, and attend till raine follow, lest by lying long in the earth, and not conceiuing for want of moisture, it lose the heart & turn to nothing. Semblably, when a man soweth early, he must bestow the more seed and sow thick; because it is long ere it swel and be ready to chit. But if he be late in his seednes, he should cast it thin into the ground, for thick sowing will choke and kill the seed. Moreover, in this feat of sowing there is a pretty skil and cunning, namely to cary an euen hand, and cast the seed equally thorowout the whole field. The hand (in any case) of the seeds-man must agree with his gate and march: it ought alwaies to go iust with his right foot. Herein also this would not be forgotten, that one is more fortunate and hath a more lucky hand than another: and the seed will prosper better and yeeld more encrease that such a one soweth: an hidden secret surely in Nature, and whereof we can yeeld no found reason. Ouer and besides, this is to be considered, that corn comming from a cold soile, must not be sowne in a hot ground; nor that which grew in a forward and hasty field, ought to be transferred into lateward lands. Howsoeuer, some there be that haue giuen rule clean contrary: howbeit they haue deceived themselues with all their foolish curiositie.

Now as touching the quantitie of seed that must be giuen, according to the varietie both of ground and grain, these principles following are to be obserued: in a reasonable good ground of a mean temperature, an acre in ordinarie proportion will ask of common wheat Triticum, or of the finewheat Siligo, 5 modij, of the red wheat Far, or of * seed [or so we call a kind of bread corn] ten Modij, of Barly six, of Beans as much as of common wheat, and a fift part or one Modius ouer, of Vetches 12, of Cich pease the greater, Cichlings the lesse, and of pease three, of Lupines ten, of Lentils 3; [as for these, folk would haue them sowed together with dry dung] of Ervile six, of Silicia or Feni-greek six, of Phascols or Kidny beans foure, of Dradge or Balmong for horse prouender, 20; but of Millet and Panick 4 Sextars. Howbeit herein can be set down no iust proportion, for the soile may alter all. And in one word, a fat ground will receiue more, and a lean lesse. Besides, there ariseth a difference another way, in this manner; if it be a massie, fast, chalky, and moist ground, you may bestow in one acre thereof six Modij, either of common wheat or of fine Siligo; but in case it be loofe and light, naked, dry, and yet in good heart and free, it will aske but foure. For the leaner that a ground is, vnlesse it be sown scant, and the straw come vp also thinne, the shorter eare will the corne haue, and the same light in the head, and nothing therein. Be the ground rich and fat, ye shall see out of one roor a number of stems to spring; so that although the grain be thin sown, yet will it come vp thick, and beare a faire and full eare. And therefore in an acre of ground you shall not do amisse to keep a meane between foure and six Modij, hauing respect to the nature of the soile. And yet some there be who would haue [of wheat] five Modij sown at all aduenture, and neither more nor lesse, whatsoever the ground be. To conclude, if the ground be set with trees, or lying on the side of an hill, all is one, as if it were lean, hungry, and out of heart. And hereto may be reduced that notable Aphorisme, worthy to be kept and obserued as a diuine Oracle: Take not too much of a land, weare not out all the fatnesse, but leaue it in some heart. Ouer and aboue the rules aforesaid, Accius in his Treatise called Praxidicus, comes in with one more of his own: Sow your ground (saith he) when the Moone is in any of these signes, Aries, Gemini, Leo, Libra, and Aquarius. And Zoroastres hath another Astronomicall obseruation by himselfe, That the Sun should be

entred

* or rather (as
ter columella)
39 daies.

* ten daies: and euery head of bigger beafts ten load; for vnlesse this proportion and quantity of muck be gathered, plain it is, that the granger or master of husbandry, hath not don his part, but failed in liting of his cattell. Some hold opinion, that the best way of mucking a land is, to fold sheep and such like small cattell thereupon, euen in the broad open field; and to this purpose they inclose or impark them within hurdles. In a word, a ground not dunged at all, groweth to be cold; and again if it be ouermuch dunged, the heart thereof is burned away. And therefore the better and safer way is to muck by little at once and often, rather than to ouerdo it at once. The hotter that a soile is, it stands by good reason, that the lesse compost it requireth.

Zea or Spelt.

entred into Scorpio, and past twelue degrees thereof, the Moone being at the same time in G Taurus.

Now followeth the deep question to be discussed and determined, As touching the fit time and season of sowing corn: which I haue put off and deferred to this present place. And this would be handled and considered vpon with exceeding great care and regard, as depending for the most part of Astronomie, and requiring good insight in the course and motion of the Planets, in the order also and influence of the fixed stars: and therefore I purpose to lay abroad the opinions and judgments of antient writers principally in that behalf. To begin therefore with Hesiod, esteemed the prince and chiefe of all those that gaue precepts of Agriculture; he hath set down one certain time of Seednes, to wit, presently after the fall or occultation of the Star Vergilia, i. the Brood-hen: and no maruell, for he wrot that book of his in Boeotia, a countrey in the very heart of Hellas or Greece, respectfully to his own countrymen and that climat: and in very truth that was the time of sowing there, as we haue noted and specified already. The best Authors of name, and who haue written most exactly of this argument, are all agreed vpon this point and conclusion, saying, That as all fowles of the aire and foure footed beasts haue their due season of ingendring; euen so there is a certaine time when as the earth is as it were in the ruit, and hath a lust to be conceiued. The Greeks in general termes haue described that season in this wise, namely, When the earth is hot and moist. Virgil giueth a precept to sow the common wheat Triticum, and the red bearded wheat Far, after the retrait or departure aforesaid of the Brood-hen Vergilia. As for Barly, he would haue it cast into the ground betwene the Æquinox in Autumne, and the winter Sun-set: but Verches, Kidney-beans, or Lentils, at the setting or going downe of the star Boote. Which being so, it would do well to digest the rising and falling both of these stars and also of others, into their set dayes; to shew (I say) at what fixed time they appear, and when again they are hidden. Some there be who are of opinion, that it is good sowing euen before the occultation of the said star Vergilia, but in a dry ground only and in hot countries: for so (say they) will the seed swell and mortifie the better; which the naturall humiditie only of the earth is sufficient to putrifie and prepare so, that when the next rain fallerh, it will be ready to spurt and chit within a day. Others attend and wait seuen dayes after the retrait of the foresaid Brood-hen, for the rain that commonly falleth about that time. There be again that begin to sow in cold regions immediatly after the Æquinox in Autumne: but in hot countries they be later in their seednes, for fear that the corn would be winter-proud and grow ouermuch before the cold weather come. But all writers accord herein, that it is not good sowing before the winter Solstice, when the daies be at the shortest: the reason is verie pregnant and apparant, for winter seed if it be sown before mid-winter, will spurt and spring at the seuen-nights end; sow after that time, you shall haue it lie in the ground forty daies before it make any shew of comming vp. Many make hast and put their seed into the ground betimes, hauing this prouerbe vsually in their mouth, *Well may ouertimely and hasty sowing oftentimes faile, but late sowing shall euer misse and deceiue the master.* Contrariwise, others there are of this minde, That it were better stay vntill the spring to do it wel and surely, rather than to sow in a bad Autumne, and hasard the losing of all. If there be no remedie therefore but to take the spring season, a man must make chioise of the time betwene the midst of Februarie [at what time as the Westwind Favonius doth rise and begin to blow] and the Æquinox in March. Some haue no regard at all to the constitution and figure of the heauens in this case, thinking the rising and falling of stars, the course and motions of celestiall bodies to be friuolous matters and nothing pertinent to this purpose, but content themselves only with obseruing the cardinall seasons of the yere, and some other times, in a generality. In the spring (say they) sow Linseed, Otes, and Poppies, and so hold on vnto the festiuall holydaies of Minerva, called Quinquatrus; like as at this day thoroughour all Lombardie and beyond the Po, they go by no other rule. As for Beans and the fine wheat Siligo, put them into the ground in the moneth of Nouember. Let the winter red wheat Far take his fortune and be interred, from the end of September, vntill the midst or fifteenth day of October. Others goe beyond that day, and continue their seednesse vnto the Calends or first day of Nouember. Now as these men haue no regard at all to the speculation of Nature, and the course of the starres; so the other before named are giuen too much thereto, and wrapt they are so high among the stars and planets, that their owne eyes be dazeled therewith: and besides, their subtilties and quidities do blind others, considering that the pra-

ctise

- A Rise of these matters must passe through the hands of rustical peasants, who are so far off from conceiuing Astronomy, & the constellations aboue, that they know not one letter of the book, nor neuer learned their A. B. C. Howbeit, we cannot chuse but confesse, that the true reason and knowledge of Agriculture, depends principally vpon the obseruation of the order in heauenly bodies: for Virgil saith very wel, That before all other things, a husbandman should be skilfull in the winds and haue the foreknowledge and prediction of them: also to haue an insight into the nature and influence of the starres, and in one word, to obserue both the one and the other, as well as the Sailers and mariners at sea. Certes, a hard peece of worke it is, and infinite; and smal hope I haue that euer I shall be able to driue into their heads that are so ignorant & grosse of conceit, this high learning and heauenly diuinitie, as touching the Planets, the fixed starres, together with the reason of their orderly motions and celestiall powers: howbeit considering the great profit that may arise and grow therupon to mankind, I will cast a proper and giue the attempt to make ploughmen Astrologers, or Astronomers at leastwise, if it may be. But first my purpose is, to lay open before their eyes certain difficultys (which troubled also some of the antient writers, and those not vnskilfull in this part of Philosophie) as touching the course and order of the Starres: which beeing not onely discovered, but also assoiled and cleared, their minds with better contentment may goe from the contemplation of heauen to the rest of Natures workes, and see those things by the effects, which they could not possibly foresee by their causes.

CHAP. XXV.

¶ The times and seasons of the rising and setting of Starres, digested into order, as well by ² day as night,

* 2. Evening and morning.

- I N the first place, there offereth it selfe vnto vs one difficultie aboue the rest, so intricate, as hardly is it possible to resolve vpon it; namely, as touching the very daies of the yere, how many they be, in number; and the reuolution of the Sunne, how and when he returneth againe to the same point: For whereas some do account the solare yere to be 365 daies iust, others adde thereunto certain quadrants or foure parts of day and night together, to wit, six houres euery yere, which beeing put together, make the fourth yere Bissextile or Leape yere: so as it is in manner impossible to assigne the certaine daies and houres of the Starres apparition or occultation.ouer and besides, how obscure, how darke and confused all this matter is, appeareth manifestly herin, That the times and seasons of the yere prefixed by antient writers, fall not out accordingly; and namely, in the obseruation of the winter seasons & tempests by them set down: for one while you shall haue them to preuent and come sooner by many daies than ordinarie, which the Greekes call *anomalion*: another while to draw back and come later, which they terme *anomalion*. Yea and for the most part this happeneth, by reason that the influence of the celestiall starres reacheth sooner or later to the earth, and thereafter sheweth the effects: so as, the common people, when they see the said foule weather past, and all cleare and faire againe, say then and not before, That such a planet or Starre hath performed his course, and is vpon the point of his Tropicke or return againe. Moreouer, considering that all these occurrents depend much vpon those stars which be set & fixed in the firmament, yet shall we haue the Planets play their parts besides, which by their motions and operations, worke no small effects vpon the earth, as we haue shewed before; and namely, causing betwene-whiles stormes of raine and haile out of course: no maruell then, if they trouble our heads and put vs out of our account, interrupting that order of the fixed Stars, vpon which we conceiued and built our hope of the faire season, and our new spring. And herin, not we only that be men faile of our reckoning, but other liuing creatures also be deceiued, which naturally haue much more sense and vnderstanding of these workes of Nature, than we, in as much as their whole life standeth thereupon: for the Summer-birds (as great fore-sight as they haue of such seasons and tempests) are ouer-taken and killed by Winter frosts and cold, comming sooner than they looked for, and before they be gone out of the countrey, as also winter foules miscarrie by the hot weather of summer, continuing longer than it was wont, and holding on still after they be come. Hereupon it is, that Virgil expressly willerh vs to learne thoroughly the skill of the wandring Starres or Planets also, and principally giueth vs warning to marke the course of that cold Planet Saturne.

But

But now to come more particularly to the signs which fore-token the Spring: some there be that goe by the Butterflie, and hold that their brood comming abroad, is an assured token that the Spring is come, for that these creatures so feeble, are not able to abide any cold: howbeit, this was checked that very yere, wherein I wrote this Booke or History of Nature's work: for seen it was and marked very well, that 3 flights of them one after another were killed with the cold weather that surprised them thrice, for that they were stirring too early, and came abroad too soon. Yea, and the very birds who are our guests in warm weather, visited vs siue or fixe daies before Februarie, & made a goodly shew of a timely Spring, putting vs in good hope, that al cold weather was gone: howbeit, there ensued a most bitter after winter streight vpon it, that nipped and killed them in manner euerie one. Hard and doubtfull therefore is the case, that whereas first and principally we were to fetch our rule from the heauens to guide and direct vs, then afterwards we should be driuen to goe by other signes and arguments meere conjecturall. But aboue all, the cause of this incertitude and difficultie, is partly the conuexity of the cope of heauen, and partly the diuerse climats obserued in the globe of the earth, by means whereof, one and the same star seemeth to rise at sundrie times in diuerse countres, and appears sooner or later to some than to others: and therefore the cause depending thereupon, is not in all places of like validity, nor sheweth the same effects alwaies at the same times. And yet there is one difficultie more, arising from those Authors who writing of one and the same thing, haue deliuered diuers opinions, according to the sundry climates wherein they were, at what time as they obserued the figure and constitution of the heauens. Now were there of these Astronomers three Sects, to wit, the Chaldeans, the Egyptians, and the Greeks. To which there may be added a fourth, which among vs *Cesar* the Dictatour first erected: who obseruing the course of the Sun, and taking with him also the aduise of *Sosigenes* (a learned Mathematician and skilfull Astronomer in his time) reduced the yere vnto the said reuolution. Howbeit, in this calculation of his, there was found an error, and short he came of the marke, which he aimed at, by reason that there was no Bissextile or leap yere by him inserted, but after 12 yeres. Now, when it was obserued by this reckoning, that the sun had performed his reuolution sooper than the yere turned about, which before was wont to prevent the course of the Sun, this error was reformed: and after euery fourth yere expired, came about the Bissextile aforesaid, and made al streight. *Sosigenes* also himselfe, albeit he was reputed a more curious and exquisite Mathematician than the rest, yet in three feuerall treatises that he made, retracting or correcting that in one booke that he had set down in another, seemed euermore to write doubtfully, and left the thing in as great ambiguitie & vndermined as he found it. As for these writers whose names I haue alleadged & prefixed in the front of this present volume now in hand, they haue likewise deliuered their opinions as touching this point, but hardly shal you find two of them in one & the same mind. Lesse maruell then if the rest haue varied one from another, who may pretend for their excuse the diuers tracts and climates wherein they wrote. As for those who liued in the same region, and yet wrot contrarie, I canot tel what to make of them: howbeit, I care not much to set downe one example of their discord & disagreement. *Hesiodus* the Poet (for vnder his name also there goeth a Treatise of Astrologie) hath put down in writing the matutine setting of the star Vergiliae (which is the occultation thereof by the raies and beames of the Sunne toward morning) to begin ordinarily vpon the day of the Equinox in Autumne. *Thales* the Milesian saith, That it falleth out vpon the siue and twentieth after the said Equinox. *Anaximander* writeth, That it is nine and twenty daies after: and finally, *Euctemon* hath noted the 48 day following the said Equinox, for the retreat or occultation of the forenamed Brood-hen star Vergiliae. Loe what varietie there is among these deepe clearkes and great Astrologers.

For mine owne part I hold well with *Cesar's* calculation, and will keep me to his obseruations as neere as I can, for that the same wil fit best with our meridian here in al Italie. Yet neuertheless I will not sticke to set downe the opinions of others, because my desseigne tendeth not to one particular place alone, but I purpose and professe to represent vnto the reader the vniuersall history of Nature, and the whole world. But my meaning is not to rehearse the names of euery Author one by one (for that were a tedious peece of work, and would require a long train of superfluous words) but only to put down the regions of euery climate, and that as succinctly and briefly as I can. Where, by the way I must aduertise the Readers, that they remember well this one thing, how when for breuities sake I name the land or region Attica, they must with- all

A all vnderstand the Islands Cyclades: when I name Macedonie, I comprehend therewith Magnesia and Thracia: vnder Egypt I comprise Phoenice, Cyprus, and Cilicia: vnder Boeotia, the regions of Locris and Phocis: and in one word, alwaies the tracts and Countries adiacent and confining together. Item, In making mention of Hellespontus onely, I take together with it, Chersonesus, and all the continent or main firme land, as far as to the mountaine Athos: in naming Ionia, I reckon also Asia the lesse or Natolia, and the Isles thereto adioyning: vnder the name of Peloponnesus I count Achaia, and other lauds in that climat lying to the West. Finally, the Chaldeans shall make demonstration, as in a map, of Assyria and Babylonia. As for Africke or Barbary, Spaine and France, maruell not if I passe them ouer in silence: for there is not a writer in all these Nations, one or other, who hath either obserued or penned downe the time when these fixed stars rise or fall. Howbeit it were no hard matter to come to the knowledge thereof in those climats and countries also, by the meridionall lines and conformities of the Parallele circles, which I digested orderly in the sixt booke of this work. For thereby a man may vnderstand the vniforme agreement in the position of the heauen, not only for whole Climats and countries, but also for euery feuerall city by it selfe, vnder the same meridian or Parallele: followin: stil the known paralels of these regions which we haue named, and taking with all the eleuation of any circle pertaining to euery such land as a man wil seeke, and respectiue to the rising of the stars, according to the equal shadowes throughout all those paralel circles. Moreouer, it ought to be shewed and declared, that ordinarily the times and seasons haue their temperature and influence euery foure yeres together: and those lightly return the same without any great alteration, from yere to yere duly according to the course and recourse of the Sun, during that term: many in eight yeres they sensibly do increase, namely by what time as the Moon is in her hundreth reuolution.

Now all the knowledge of the heauens pertinent to Agriculture, standeth principally vpon three sorts of obseruations, to wit, the rising of the fixed stars, the setting of the same, and the four cardinal points, to wit, of the two Tropicks or Sunsteads, and the double Equinox, which diuide the whole yere into foure quarters and notable seasons. Where note, that the rise and fall of those stars before said is to be considered and taken two waies. For first when the Sun approacheth vnto them with his beams, they be hidden and no more seen: likewise after his departure they shew themselves again: and as the one, me thinks, might haue bin more aptly called an Apparition than a Rising, so we should haue framed our tongue in common speech to haue termed the other Occultation, rather than Setting. Secondly, according as the said stars begin either to shine out or be hidden in the morning before the Sunne be vp, or at euening after the Sun is set, they be said to rise and go downe, and thereupon are named Matutine or Vespertine, Orientall or Occidental, according as the one or the other hapneth vnto them in the twi-light, morning, or euening. Certes, when they are to be scene Matutine or Vespertine, it must be at the least three quarters of an houre either before the Sun is vp, or after he is downe: for within that space there is no looking after them. Moreouer, some stars there be that rise and fall twice. But take this with you, ere I proceed further, that all this speech of mine is to be vnderstood of the fixed stars, which being setled fast in the sky, moue not of themselves: and in no wise of the planets.

As touching the foure cardinal seasons of the yere, whereby it is diuided into foure quarters, limited they be according to the light more or lesse, and as the daies be longer or shorter: for so soon as the winter Sunstead is past, the daies do lengthen; and by that time that 90 daies and three houres be gon and past, they be iust as long as the night, and this is called the spring Equinox. From which very day, for ninety three days together and twelue houres, namely vnto the summer Sunstead, the daies be longer than the night, and so continue vntill the Autumne Equinox, at what time the daies and nights be equall againe; from which time they shorten and decrease as they grew in length and increased before, for eighty nine daies together, and three houres, vntill the foresaid winter Sunstead, when as the daies be shortest. And here you must note, that in all these additions of houres at this present, I mean those only that be Equinoctiall, which diuide the day and night equally in foure and twenty parts, and not the common houres of any other day artificiall whatsoever. Also take this with you, that all these distinctions and diuisions of the foure seasons, begin alwaies in the eight degree of those signes vnder which the Sunne is at those times: as for example, The winter Sunstead or shortest day

* ortus & occasus Heliacut.

weekes.

of the year, called in Latine Bruma, falleth out in the eight degree of Capricorn, which lightly is vpon the * 18 day before the Calends of Ianuary. The Spring Æquinox, when nights and daies be of a length, in the eight degree of Arics. Semblably, the summer Sunstead, or longest day of the year, is alwaies when the Sun is entred eight degrees into Cancer. Last of all, the other Æquinox in Autumne, when day and night is equall, lighteth vpon the eight degree of Libra. And certes, feldom or neuer shall you see any of these foure daies without euident shew of some notable change in the weather. Again, these cardinall seasons or quarters of the year admit also their sub-diuisions still into some notable and special times, obserued in the * very middle space from the one and the other. For betweene the summer Sunstead and the Æquinox in Autumne iust vpon the fife and forty day after the same Sunstead, the reitrait or setting of the star called in Latine Ficulæ, i. the Harp, beginneth the Autumne. Likewise, betweene that Æquinox and the winter Sunstead or shortest day of the year, the Matutine or morning fall of the star Virgilæ, vpon the three and fortieth day after the said Æquinox, setteth the beginning of the winter. So likewise vpon the fife and fortieth day between mid-winter or the shortest day of the year, and the spring Æquinox, the blowing of the Western wind Favonius beginneth the Spring. And last of all, vpon the three and fortieth day from the sayd Æquinox toward the Summer Sunstead, at what time as the star Virgilæ doth rise Matutine, begins the Summer

But to returne again to our Agriculture, begin I will at the Seednes of Frument come, that is to say, at the rising or apparition of the starre Vergiliæ in the morning, without making any mention at all of other pety stars, for to interrupt the train and course of our treatise, & to heap difficulties one vpon another, considering that the fierce and vehement star Orion is departed a great way off from vs by that time. I am not ignorant, that many fall to sowing corne long before, and preuent this time, beginning their Seednes within 11 daies after the Æquinox in Autumne, namely, at the approach and rising of the star Corona, i. the Crowne; promising themselves assuredly to haue rain vpon it for certain daies together. Xenophon would not haue vs begin to sow before that God giue vs some good signe and token so to do. And Cicero our countryman expounding this saying of Xenophon, taketh the raine in * Nouember to be that signe which God giueth: whereas in very deed the true and vndoubted rule to goe by, is to make no great hast into the field for to sow, before the leaues begin to fall: and this euery man holdeth to be at the very occultation or reitrait of the star Vergiliæ. Some, as we haue before said, haue obserued it about 3 daies before the Ides of Nouember. And for that the said star is so euident in the heauen, and easiest to be known of all others, called it is by the name of a garment hanging out at a Brokers shop. And therefore by the fall or reitrait thereof, as many men as haue a care and forecast to preuent the couetous dealing of the merchant-Tailor (as commonly such occupiers lie in the wind for gain) guesse aforehand what winter will follow: for if it be a cloudie season when the star retirith, it threatens a rainy winter and then these merchants presently raise the price of the clokes which they sel: but if the weather be faire and cleare at the setting or occultation thereof, it sheweth a pinching and hard winter toward; and then they hold other garments also very deare. But this Husbandman of ours, who cannot skill at all to looke vp and to learn the order and position of the heauens, must spy this signe of winter amongst his briars and brambles: he must find (I say) the time of Seednes as he looketh downe vpon the ground, namely, when he sees the leaues fallen and lying vnder his feet. Thus may a man know the temperature of the climat, and the year, according as he perceiues the leaues be fallen more at one time than another, sooner also in some places, and later elsewhere. For as the season is forward or late, as the climate also is affected, so are the trees knowne to shed their leaues accordingly. And in very truth this is the truest signe of all others. And the best thing therein is this, that being general throughout the whole world, and yet peculiar to each place, it neuer faileth. A man might make a wonder hereat, if he did not see and remember, that vpon the very shortest day in the yere, euen in midwinter when the Sun is entred Capricorn, the herb Penyroial vseth of it selfe to floure, either set in chaplets, or otherwise hanging and sticking in the flames; so willing is Nature to shew vs all her secrets, and to keepe nothing hidden from vs. For loe what signes and marks she hath giuen vs, whereby we might know the time of sowing corn: and verily, this is the only true and infallible direction grounded vpon approoued experience, and the same shewed first by dame Nature: for by this dropping & fall of leaues what doth she els teach

* Called by our
Husbandmen
Gore-moone.

A teach and counsell vs but to haue our eye vpon the ground, and to cast seed into it, assuring vs of a certain supply of dung and compost, by ouerspredding the ground, and cast seed into it, that soon will turne into muck: what doth she else (I say) but by couering the earth in this manner with leaues, shew how carefull she is to defend it against hard frosts and pinching winds, and in one word, thereby putteth vs in mind to make the more hast and get our seed vnder mould? As for Varro, he is of the same opinion for beans also, and willet vs to obserue the said rule in sowing them at the fall of the leafe. Others are of this mind, that the best sowing thereof is in the full Moone. But for Lentils, we should attend the last quarter toward the change, to wit, from the 25 day to the thirtieth. Also, that Vetches must be sowed at the said age of the Moon: for in so doing we shall preferre such pulse from the naked snail. Howbeit, some others there be that indeed would haue these kindes of Pulse to be sowed at this time of the year and age of the Moon for prouender and forage to be spent out of hand: many if we would keepe the same for seed, then we should take the season of the Spring.

Besides those rules and tokens aboue specified, there is one more, which Nature vpon an extraordinary providence ouer vs, hath presented vnto our eies after a wonderfull manner, which Cicero expresth in these termes

*Iam vero semper viridis, semperq; gravata
Lentiscus, triplici solita est grande scire fatu:
Ter fruges fundens, tria tempora monstrat arandi.*

C	The Mastick tree All times, you see, Is clad and richly dight, With green in cold, With fruit three-fold, A faire and goodly sight.	As she therefore, By Natures lore, Doth fruit thrice yearely beare: So thereby we Know seasons three, Our land to duly care.
---	--	---

Of which three seasons, one is appropriate for the sowing both of Poppy and also of Linefeed: But since I haue named Poppy, I will tell you what Cato saith as touching the sowing thereof: vpon that land (quoth he) where you mean to sow Poppy, burn your winding rods, the cuttings also and twigs of vines, which remained and were left at the pruning time: when you haue burned them, sow wild Poppy seed in the place; for it is a singular medicine being boiled vp to a Syrup in honey, for to cure the maladies incident to the chawes and throat. As for the garden Poppy, it hath an excellent and effectfull vertue to procure sleep. And thus much concerning Winter corne and the Seednes thereof.

CHAP. XXVI.

¶ A summarie or recapitulation of all points of Husbandry: and to what out-works in the field a husbandman should be employed, respec-
tively to euery month of the year.

E B Vt now to compassse vnder a certain brieve Abridgement or Breviarie, all points of husbandrie together: At the same time before named [to wit, at the falling of the leafe] it is good also to lay dung vnto the roots of trees; likewise to mold and bank vines: and one workman is sufficient for one acre. Also, where the nature of the ground will beare it, the husbandman shall not do amisse to disbranch and lop his tree-groues, to prune his vineyards, to hollow the ground of his seminaries and nurse-plots with mattocke and spade, and dresse the mould light; to open his sluices and trenches for water-course, to drie and drain it out of the fields; and finally, to wash his Wine-presses first, and then to shut and lay them vp dry and safe. Item, after the Calends or first day of Nouember, let him set no hens vpon eggs vntill the winter Sunstead be past: when that time is come and gon, set Hens hardly, and let them coue 13 eggs; marie better it were all Summer long to put so many vnder them; for in winter fewer will serue: howbeit neuer vnder nine.

Democritus giueth a guesse what Winter we shall haue, by the very day of the Winter Sunstead: for look what weather is then and for threedayes about it, the like winter (he supposeth)

E e e

will

will ensue. Semblably, for the Summer he goeth by the other Sunstead or longest day of the year: and yet commonly for a fortnight about the shortest day in the year (to wit, during the time that the fowles Halcyones do lay, couve, and hatch their eggs in the sea) the windes lie, and the weather is more mild and temperat. But as well by these signes as all other whatsoever, we must guesse the influences and effects of the stars, according to the euent, within some latitude of time; and not so precisely to limit and tie them alwaies to certain daies prefixed, as if they were bound to make their appearance peremptorily in court, iust then, and faile not.

Moreouer, in mid-winter meddle not at all with vines, touch them not in any hand, but let them alone. What then is the husbandman to do? Mary then (quoth *Hyginus*) after seuen daies be once past from the Sunstead, he is to refine his wines from the lees, and let them settle, yea and to poure them out of one vessel into another, provided withall, that the Moon be a quarter old. Also about that season (to wit, when the Sun is in Capricorn) it is not amisse to plant cherrie trees, and let their stones: then is it good also to giue oxen Mast to feed them; and one Modius or p.cke is sufficient to frue a yoke at one refection: allow them more at once, you glut them and fill them full of diseases: but at what time soeuer you make them this allowance, vnlesse you hold on thirty daies together, folke say, they will be scabbed and mangie when the Spring commeth, that you will repent for cutting them so short. As for felling timber trees, this was the proper season which we appointed heretofore. All other winter works for an husbandman to be busied in, would be done in the night for the most part: sit vp he must late, and rise betimes by candle light, and watch hardly about them, for that the nights be so much longer than the daies: let him a Gods name find himself occupied with making Wicker baskets and hampers, winding of hurdles, & twisting of frailes and paniers: let him thwite torch wood taperwise with links and lights: and when he hath by day light made ready and prepared thirtie poles or railes for vines to run on, and sixty stakes or props to support them, hee may in the euening make fivie poles or perches, and ten forks or supporters; and likewise as many early in the morning before day light.

But now to come to *Casars* reckoning of the times & digestion of the coelestiall signes: these be the notable stars which are significant and do rule that quarter which is between the winter Sunstead and the rising of the Western wind Favonius. Vpon the third day (saith he) before the Calends of Ianuarie, which is the 30 day of December, the Dog-starre goeth downe in the morning: vpon which day in Attica and the whole tract thereto adioyning, the star Aquila, [the Ægle] fereth (by report) in the euening, and loseth her light. The euen before the Nones of Ianuarie, i. the fourth day thereof, by *Casars* account [I mean for the meridian of Italy] the Dolphin star riseth in the morning, and the morrow after, the Harp-star Fidicula; vpon which day, in Egypt, the star Sagitta [i. the Arrow] setteth in the euening. Item, from that time to the sixt day before the Ides of Ianuarie [i. the eighth day of that moneth] when as the same Dolphin goeth down or retireth out of sight in the euening, usually we haue in Italy continual frost and winter weather: as also when the Sun is perceiued to enter into Aquarius, which ordinarily falleth out sixteen daies before the Calends of Februarie [i. the seuenteenth of Ianuary.] As for the cleare and bright star, called the star Royal, appearing in the breast of the signe Leo, *Tu-bero* mine Author saith, that eight daies before the Calends of Februarie, to wit, the 25 day of Ianuarie, it goeth out of our sight in the morning: also ouer-night before the Nones of Februarie [i. the fourth day of the same moneth] the Harp-star Fidicula goeth down and is no more seene. Toward the later end of this quarter, it is good and necessarie to dig and turne vp fresh mould with mattock and spade, against the time that roses or vines shal be set, where soeuer the temperature of the climat will beare it: and for an acre of such worke, sixty labourers in a day are sufficient to doe it well. At which time also old trenches and ditches would be scoured or new made. For morning worke before day the Husbandman must look to his iron tooles, that they be ground, whetted, and sharpened; that their steles, helues, or handles, be fitted and set to their heads; that shaken tubs, barrels, and such like vessels, be new cowed, bound with hoops, and calstretted; that their stauess be well scraped and cleansed, or else new set into them. And thus much of this Winter Quarter, as farre as to the comming of the Western winde Favonius.

Now as touching the entrance of the new Spring, which is from the rising of the said winde to the Equinox in March; *Cesar* sets downe for it the time, which for threed daies together is variable

A riable and inconstant weather, to wit, seuenteen daies before the calends of March, which is the thirteenth of Februarie. Also 8 daies before the said Calends, which is the 22 of Februarie, vpon the sight of the * first Swallow; and the morrow after, vpon which day the star Arcturus riseth Vespertine, i. appeareth in the euening. In like manner, *Cesar* hath obserued, that the said wind hath begun to blow three daies before the Nones of March, to wit, the fift of March, iust with the rising or apparition of the Crab-star Cancer. Howbeit most writers of Astrologic do assigne the first entry of the Spring and the comming of this wind, to the 8 day before the Ides of March, which is the eight of that moneth, when as the star Vincemiator, i. the Grape-gatherer, beginneth to appeare: at what time also the Northerly starre called the Fish, riseth: vpon the morrow whereof, to wit, the ninth day, the great starre Orion sheweth himselfe in his likenesse. In the region Atrica where Athens standeth, it is obserued, that the star Milvus, the Kite or Glede, appeareth then in that climat. *Cesar* moreouer noted, that the star Scorpio rises vpon the * Ides of March, those fatal Ides (I say) that were so vnfortunate vnto himselfe: also, that vpon the 15 Calends of Aprill, which is the 18 of March, the foresaid Milvus, the Kite-star, appeareth to them in Italie, and three daies after, the Horse-star is hidden toward the morning. This is the freshest, the most busie or stirring interual or time between that husbandmen haue; and yet therein they be oftentide deceived, for commonly called they are not to their work the very same day that the wind Favonius should by course blow, but when it begins to be aloft; which is a point to be considered and obserued with right great regard: for if a man would take heede and marke well, this is that moneth wherein God giueth vs that sure and infallible sign which neuer faileth. Now from what quarter or coast this wind doth blow, and which way it commeth, albeit I haue shewed already in the second booke of this storie, yet will I speake thereof more distinctly and exactly anon; mean while, from that day (when soeuer it hapneth) on which that wind beginneth to blow, come it sooner (as namely, when it is a timely and forward spring) or come it later, if it be a long winter (for it is not alwaies the * sixth day iust before the Ides of February) from that time, I say, must the rustical paisants settle to their work, then are they to goe about a world of toilsome labour, then must they plie their businesse and make speed to dispatch those things first that may not be deferred & put off, then or neuer would their summer three month come be sowne, their vines be pruned in manner abovesaid, their Oliue trees dressed and trimmed according: Apple-trees stocks and such like fruits, are then to be set and grafted; then is the time to be digging and deluing in vineyards, to remoue some yong plants out of their seminaries, and digest them in order as they must grow, and to supply their plots with new seed and impes: Canes and Reeds, Willows and Oliers, Broom also would then some be set, and others cut downe: Elmes, Poplars, and Plane trees, ought then to be planted, as hath been said before: then is the meetest season to cleanse the corne fields, to sarcle and rid the winter corn from weeds, and especially the bearded red wheat Far: in doing whereof, this must be the certain rule to direct the husbandmen, namely, when the root of the said Far begins to haue foure strings or threads to it. As for Beans, they must not be meddled withall in that order, before they haue put out three leaues; and then verily they must be lightly gone ouer, and cleansed rather with a light hooke, than otherwise. When Beanes be bloumed, for 15 daies together they ought not to be touched. As touching Barley, it would not be * sarcl'd or raked, but in a drie ground, and when the weather holds vp. Order the matter so, that by the Equinox in March, all your pruning and binding of Vines be done and finished. If it be a vineyard, foure men are enough to cut and tie an acre of vines: and if they grow to trees, one good workeman will be able to ouercome fifteen trees in one day. This is the very time moreouer of gardening and dressing rose-plots or rosiers [whereof I mean to treat apart and seuerally in the booke next following] of drawing vinets also, knots, and fine storie works in gardens: this is the only season to make trenches and ditches: the ground also would now be broken vp for a fallow against the next year, according to the mind and counsell of *Virgil* especially, to the end that the Sunne might thoroughly parch and concoct the clots, and thereby make it more mellow for the Seednes. Howbeit I doe like better of their opinion (as the more thriftie and profitable of the two) who aduise to plough no ground in the mids of the Spring, but that which is of a mean temperature: for if it be rich and fat, presently the weeds will ouergrow and take vp the scanis and furrowes: againe, say it be poore and leane, the hot weather comming so soon vpon the fallow, will dry it too fast, spend all the moisture, and kill the heart therof, which should maintain the seed

* Whereupon the said wind Favonius, is called Chelidonias and Ornebius.

* 13 of March: for vpon that day was he murdered.

* 2 the Queen of Februarie.

* Sarcl'd.

put her horns direct and streight forth, she presages thereby some great tempest at sea presently to follow, unless it be so that she haue a guirland or circle about her, and the same cleer and pure; for then there is good hope that there will be no foule nor rough weather before the full. If at the full, one halfe of her seeme pure and neat, a signe it is of a faire season; if it be red, the wind will be busie; if enclined to blacke, what else but raine, raine. Doe you see at any time a darke mist or cloud round about the body of the moone? it betokeneth winds from that part where it first breaketh: and in case there be two such cloudie and mistie circles enuironing her, the tempest will be the greater: but how if there be three of them for failing, and those either black, or interrupted, distracted and not vnited? surely then there will be more storms & more. The new moone whiles she is croissant, if she rise with the vpper tip or horne blackish, telleth beforehand that there will be store of raine after the full, and when she is in the wane: but if the nether tip be so affected, the rain will fall before she be at the full. But what if that blacknesse appeare in the middle of her body betwene; then (saith Varro) it will poure of rain in the very full. A full moone hauing about her a round circle, sheweth that there will be wind from that part, where the said circle is most splendant. If her hornes appeare when she riseth, more grosse and thicke than ordinarie, look soon after for a terrible tempest and a stormie weather. If she shew not in our Horizon before the prime or fourth day after the change, and the West wind blow withall, then that moone throughout threatneth cold and winter weather: and if the day after the full she seeme extraordinarily enflamed, she menaceth vnto vs sharp showres and bitter tempests. Finally, in euery moon there be eight points and so many daies (according as the lighteth vpon the angles of the Sunne) which most men obserue onely, and take their presages of future weather by, to wit, the third, seuenth, eleuenth, fifteenth, nineteenth, one and twentieth, seuen and twentieth, and the very day of her conjunction or change.

In the third place, a man may know the disposition of the seasons by the fixed starres, and therefore it behooueth to obserue and marke them. They seeme otherwhiles in the sky to sit and run too and fro, and then we shal not be long without great winds, rising from that quarter where such appeared and gaue token.

The starrie skie, if it shew cleare and bright al ouer, and in euery part alike, during that particular season [namely, between the occultation of the Harp-star, and the Equinoctiall point] which I proposed and set downe heretofore, it is a fore-token of a faire and drie Autumne, but yet cold.

If the Spring add Summer both, passed not cleare without some raine and wet weather, it will be an occasion that the Autumne following shall be drie, and lesse disposed to wind; howbeit, thicke, muddy, and enclined to mists. A faire and drie Autumne, bringeth in alwaies a wintrie winter.

When all on a sudden the stars lose their brightnesse and looke dim, and that neither vpon a cloud nor a mist in the aire, it signifieth either raine or grievous tempests.

If the starres make semblance as if they flew vp and down many together, and in their flying seem whitish, they denounce winds from that coast where they thus do shoot. Now if it seeme to the eye, as if they ran and kept one certaine place, those winds will hold and sit long in one corner: but in case they do so in many quarters of the heauen, they betoken variable and inconstant winds, going and coming, and neuer at rest. [When you see a circle about any of the other fixe planets or wandering stars, you shall haue powring showres soone after.] Within the signe Cancer, there be two prettie stars which the Mathematicians call Afelli, [i. little Affes] betwene which there seemeth to be a small cloud taking vp some little roome, and this they name in Latine Praesepia, [i. a Crib, Cratch, Bowzey, or Manger:] now if it chauce that this Racke or Crib appeare not, and yet the aire bee faire and cleare otherwise, a signe it is of cold, foule, and winter weather. Also if one of these two little stars, to wit, that which standeth Northerly, be hidden with a mist, then shall you haue the South wind to rage; but in case the other which is more Southerly, be out of sight, then the Northeast wind wil play his part.

As touching the Rainbow, if it appear double as if there were two of them at once, it telleth of raine toward. A Rainbow presently after raine, is a signe of faire weather: but this is not so certaine, neither will it hold long. Also, when a man seeth new circles still about any planets, there will be much raine soone after.

In Summer time, if there chauce to be more thunder than lightning, it threatneth winds from

from that coast where it thundreth: contrariwise, if it lighten much & thunder little, looke for rain plentiewhen you see it lighten, and the skie otherwise cleare & faire, it is a token that rain and thunder will follow thereupon, yea and rigorous cold weather besides: but the cruellest and most bitter impressions of the aire, ensue vpon such lightnings: as come from all the foure quarters of heauen at once: if it lighten, from the Northwest only it betokens rain the day following; if from North, it is a signe of wind from thence: if from the South, Northwest, or full West, it happen to lighten in the night & the same be faire, it sheweth wind and rain from out of those coasts: morne thunders foreshew winds, but if they be heard at noon, they presage rain.

As touching clouds, if you see the rack ride apace in the aire, the weather being faire & drie, looke for wind from that quarter whence those clouds doe come; and if they seeme to gather thicke in that place, dispeared they will be and scattered when the Sun approacheth: but more particularly, if this happen from the Northeast, they portend rain; if from the South, storm and tempest: if at the Sun setting the rack seeme to ride from both sides of him into the open aire, they shew of tempests toward: if the clouds be very blacke, flying out of the East, they threaten rain against night: but if they come out of the West, it will surely raine the morrow after, if the clouds be disparted many together out of the East, and flie like fleeces or flocks of wooll, they shew rain for 3 daies after: when clouds flie low, and seeme to settle vpon the tops of the hills; looke shortly for cold weather, contrariwise, if you perceiue those tops of mountaines cleare without moist or cloud, the weather will soone take vp and turne to be faire: when the clouds seeme to be heauily charged and full, and yet looke white withall (which * constitution of the aire is called commonly the white weather) there is an haile-storme at hand: moreover, be the skie neuer so cleare, the least cloud appearing therein, is enough to engender and foreshew wind and storme: mists if they come downe and fall from the mountaines, or otherwise descend from heauen and settle vpon the vallies, promise a faire and drie season.

Leauing the stars and clouds above, let vs come to our fires that we make and keepe in our houses here beneath, for they are to be raunged in the next place of our prognostication. If the fire then burne in the chimney pale, and keep there with a huzzing noise, we find by experience it foreshewes tempest and stormie weather: as also wee may be sure of rain, in case we see a fungous substance or foot gathered about lampes and candle snuffs: if you see the flame either of fire or candle mount winding and wauing as it were, long you shall not be without wind. The like is to be said of fire and candle light, if either they seem to go out of themselves, or to kindle and take fire with much adoe. Also, when we discern in the fire a number of sparkles gathered together and hanging one to another: or if when the pot is taken off from the fire, the coles sticke to the bottome and sides: or when the fire being raked in embres, keepeth a spitting and sparkling from it: also, if the ashes lying vpon the hearth grow together: and last of all, when the liue-cole shineth brighter or scorcherh more than ordinarie, all these be signes of rain.

Goewe a little lower to the water, for that element also giues signes of the weather: and first of all, if you see the sea within the haue, after the floud is gone, in a low and ebb water to bee calme, and yet heare it keep a rumbling noise within, it foreshews wind: if it doe thus by times and fits one after another, resting still and quiet between whiles, it presages cold weather & rain. Item, if in calme and faire weather the sea stonde or water banks resound and make a noise, it is a token of a bitter tempest: so it fares also with the very sea it selfe, for if it be calme, & yet make a roaring, or if the some thereof be seen to scatter to & fro, or the very water to boile & buble, you may be bold to foretell of tempests: the Puffins also of the sea, [i. fishes named in Latin Pulmones] if they appear swimming aboue water, foreshigne cold weather for many daies together: oftentimes the sea being otherwise calme, swells, & by heouing higher than ordinarie, sheweth she had wind good store enclosed within her, which soon after will breake out into a tempest.

Let vs come aland againe, and marke the disposition of woods and hills: you shall heare the mountains and forests both, keep a founding and rumbling noise, and then they foretell some change of weather, nay you shall mark the leaues of trees to moue, flicker, and play themselves, & yet no wind at all stirring, but be sure then you shall not be long without. The like prediction is to be gathered by the light downe of either poplars or thistles flying too and fro in the aire; also of plumes and feathers floting vpon the water. Goe down lower to the vales & plains: if a man chance to heare a bustling there, he may make account that a tempest will follow. As for the rumbling in the aire, it is an vndoubted signe and token thereof.

G g g

More-

* Some call them Towers.

Moreover, the verie bruit and dumb creatures preface and giue warning what weather there will be. To begin with the fishes of the sea: the dolphins playing & disporting themselves in a calme water, doe certainly fore-shew wind coming from that coast whence they fetch these frisks and gambols: contrariwise, if they fling and dash water this way and that way, the sea at that time being rough and troubled, it is an infallible signe of a calm and of faire weather toward. The Cuttle or little Calamarie Loligo, launching it selfe and flying about the water; the Cockles & winkles cleaving and sticking hard to the grauell, the Sea-urchins thrusting themselves into the owfe and mud, or otherwise balaised & couered with sand, be all signes of tempests neare. The like may be said of Froggs, when they crie more than their custome is, and of Seamewes also, when they gaggle in a morning betimes extraordinarily, semblably, the Cormorants, Gulls, Mallards, and Ducks, when they keep a prouing of their feathers with their bills, fore-shew wind: and generally, when you see other water-foule to gather and assemble together and then combat one with another, or Cranes make haft to flie into the midland parts of the maine. The Cormorants and Gulls flying from the sea and standing lakes, and Cranes soaring aloft in the aire still, without any noyse, doe put in comfort of a faire and drie season: so doth the Howlat also, when she cries chuiit in rainie weather: but if it be then faire and drie, we shall be sure to haue foule tempests for it afterwards: Rauens crying one to another as if they lobbed or yexed therewith, and besides clapping themselves with their wings, if they continue this note, doe portend winds; but if they giue ouer between-whiles, & cut their crie short as if they swallow it backe again, they preface rain and wind both. Lacke-dawes, if it be late ere they returne from their reliefe abroad, foretold cold and hard weather; so do the white-birds when they assemble and flock together, as also when land-foule (and the crow especially) keep a crying against the water, clapping their wings, washing also & bathing themselves. If the Swallow flie low and so neere the water, that the flap the same oftentimes with her wings, it is a sign of rain and foule weather. Semblably, all other birds that nestle in trees, if they seem to make many flights out, but returne again quickly to their nests. Moreover, if Geese hold on a continuall gagling out of all order vtunably, a man may guesse no better by them, no more than he can of the Heron which he seeth heavy and sad vpon the sands.

And no maruell that these riuier-foules, or generally any other birds of the aire whatsoeuer, should haue a secret preface and foreknowledge of the disposition of the aire; for the very four-footed beasts of the earth doe make shew thereof by their behauiour. The sheep and such small cattraile, leaping and playing wantonly, dancing also as vntowardly without measure, doe testifie some change of weather: nay the dull and heauie oxen holding vp their nose and muzzles, snuffe and smell into the aire, yea and keep a licking against the haire [toward rain.] Also when you see the foule and filthie hogs, rend, teare, and fling about them bottles of hay, and yet they care not for it when they haue done, because it is no meat for them: likewise if you perceiue the pismires or ants either lying close and idle, full against their nature (whose propertie is to be industrious and euer busie) or encountering one another in battailewise, or else carying their eggs abroad out of their holes. Finally, when the mads or earthwormes come forth and appeare, a man may be bold to foretell of a change in the weather.

What should I say more? It is knowne for certaine, that Clauer-grasse or hearbe-Trefoile will looke rough against a tempest, yea and the leaues thereof will stand staring vp as if it were affraid thereof. And to conclude and make an end once of this discourse, whensoever you see at any feast the dishes and platters wherein your meat is serued vp to the board, sweat or stand of a dew, and leauing that sweat which is resoled from them either vpon dresser, cupboud, or table, be assured that it is a token of terrible tempests approaching.

	3		

When thou hast found out in this maner the North-east wind Aquilo, be sure that the wind which bloweth full against it from the point where the Sun setteth in midwinter when daies be shortest, is the Southwest, called in Latin, Africus; and in Greek, Lybs. Obserue this wind well, for if a beast after she be couered, turn about directly into this wind, she will for certaine conceiue a female. And thus much of the Line in the Quadrant next to the North point on the East side.

The third line from the North point (which we drew first through the latitude of the shadow before said, and which we called Decumana) pointeth out the Equinoctial Sun-rising in March and September, directeth thee also to the East wind vnder it, called in Latine Subsolanus, and in Greek Apeliotes. Where the climat is healthful and temperat, let vineyards be planted and arranged into this wind: let ferm-houses also in the country be so built, as the dores and windows open into it. This wind loueth well to be dropping, and to distill gentle shoures of rain; howbeit drier it is than the West wind Favonius, which bloweth ouer-against him from the Equinoctial Sun-setting full West, called in * Zephyrus. Vpon this Western wind Oliue rowes should stand, according to *Cato's* mind. This wind is he that beginneth the Spring: this winde openeth the veins and pores of the earth, and with his milde coldnesse is healthfull and wholesome for all plants, for man also and beast. This wind gouerneth this whole season, and prescribeth the time for pruning Vines, for fardeling and dressing corne, for planting trees, for grafting fruit, for trimming and ordering Oliues; and to say all in one word, so kind he doth breath, that he cherisheth and fostereth the earth and all things thereupon.

The fourth line in your quadrant or compasse (reckoning from the North point, which also reacheth next to the South point on the East side) noteth the Sun-rising in mid-winter when the day is shortest; and withall the Southeast wind called in Latine Vulturus, and in Greeke Eurus, which as it is a drier wind than the two last named, so is it also warmer. In regard whereof it is good to set Bee-hiues and plant vines tending into this course, I meane in other parts of Italy remote from the sea, and also in Gaule. Then shall you haue to blow full opposit vnto it the wind Corus, directly from the sun-setting in mid-summer when the day is longest: by-west from the North; and this North-west wind the Greeks call Argetes: one of the coldest he is, like as all they be which blow from any point of the North. No maruell therefore if he be as much dread and feared as the North winde Septentrio, for commonly he bringeth with him haile stormes good store.

As touching the Southeast wind Vulturus, if the coast be cleare where and when he beginneth to rise, it will not be long ere he lie, and commonly hee is down before night, but the East wind indeed continueth most part of the night. But be the wind what he will be, if he blow sensibly hot, you shall haue him hold many daies together. And to conclude, would you know when to haue a North-west wind? marke when the earth drieth suddenly at one instant, it will not be long but he will be with you: contrariwise, when you see the ground moist and wet with a kind secret dew vnseen and vnknown, reckon vpon it that shortly you shall haue a South wind to blow. And thus much for winds.

CHAP. XXXV.

¶ Signes to prognosticate what weather is toward.

HAuing thus set down sufficiently a discourse of the winds, because I would not re-iterate one thing often, what remaineth now, but in good order to passe & proceed to the prognostication and fore-knowledge of the weather? and the rather, for that I see that *Virgil* took great pleasure herein, and stood much vpon this point: for thus he relateth vnto the rude and ignorant men of the country, That oftentimes in the very mids of haruest hee hath seene whirle-puffs and contrarie winds encounter and charge one another as it were in battell, doing much harme to corne. Moreover it is reported, that *Democritus* at what time as his brother *Damasus* was entred well into haruest worke, taking the opportunity (as he thought) of a most hot season, besought him earnestly to let the rest of his corne stand still a while longer, and to make hast to get that into the Barne vnder rouse, which was cut and reaped downe; and this he did without any reason by him made, why and wherefore. And what ensued hereupon? Surely within few houres after, there poured downe a mightie showre of raine, and proued *Democri-*

A to be a wife man and a true prophet. Moreover, it is a rule commonly giuen and obserued, That neither Reeds would be set & planted but toward rain, nor corn sowed but against a good showre. And therefore since this skill is of such importance, I am content briefly to touch those signes that foreshew what weather will be, and make choise of such which by search and experience are knowne principall and make most for this purpose.

And first begin I will at the Sun, the best prognosticator of all others: When he rises cleare and not fiery red, it is a signe that the day will be faire; but if he shew pale and wan, it presages a cold winter-like haile-storme that very day: but in case he went downe ouer-night cleare and bright, and so rose the next morning, so much surer may you be of faire weather. If the Sunne in rising seeme hollow, he foretellet rain: and when before his rising, the clouds be red, the winds will be aloft that day: but in case there be some blacke clouds intermingled among, you shall haue raine withall. If the raies and beames of the Sun be red, both when he riseth and when he setteth, there wil fall good store of raine. Are the clouds red about the Sun as he goes downe? you shall haue a fair day the morrow after. If when the Sun doth rise you see flying clouds dispersed, some into the South, and others Northward (say all be cleer and faire otherwise about him) make reckoning that day of wind and raine both. Marke at his rising or going downe, if his beames be short and as it were drawne in, be sure of a good showre. If at the Sun setting it raine, or that his raies either looke darke and blew, or gather a banke of clouds, surely these be great tokens of tempestuous weather & storms the morrow after: when in his rising the beames shine not bright and cleer, although they be not ouer-cast with a cloud, yet they portend rain. If before he rise, the clouds gather round together like globes, they threaten sharpe, cold, and winter weather: but in case he driue them before him out of the East so as they retire into the West, we haue a promise thereby of a faire time. If there appeare about the bodie of the Sun, a circle of clouds compassing it round, the nearer they come about him and the lesse light that they leaue him, the more troubled and tempestuous weather wil follow: but in case he be enuironed with a double circle, so much more outrageous and terrible wil the tempest be. If peradventure this happen at his rising, so as the said clouds be red againe which compass the Sun, look for a mighty tempest one time or other of that day. If haply these clouds enclose him not round, but confront and seeme as if they charged vpon him, look from whence they come, from that quarter they portend great wind: and if they encounter him from the South, there will be raine good store and wind both. If as the Sun riseth he be compassed with a circle marke on what side the same breaketh and openeth first, and from thence look for wind without faile: but if the said circle passe and vanish away all at once equally, as well of one part as another, you shall haue faire weather vpon it. If at his rising you see him to cast his beames afar off among the clouds, and the mids between be void thereof, it signifieth raine. If he spread his beames before he be vp and appear in our Horizon, look for wind and water both. If about him toward his going downe there be seene a white circle, there will be some little tempest and troublesome weather that night ensuing: but in stead thereof if he be ouer-cast with a thicke mist, the tempest will be the greater and more violent. If the Sunne couchant appeare fierie and ardent, there is like to be wind. Finally, if the circle aforesaid be blacke, marke on which side the same breaketh, from thence shall you haue blustering winds. And so an end of the Sunne and his prognostications,

Now by right, the Moone challengeth the next place for her presages of weather to come. First and foremost, the Egyptians obserue most her prime: or the fourth day after the change: for if she appeare then, pure, faire, and shining bright, they are verily perswaded that it will be faire weather: if red, they make no other reckoning but of winds: if dim and blackish, they look for no better than a soule and rainie moneth. Mark the tips of her hornes when she is due daies old, if they be blunt, they foreshew raine; if pricking vpright and sharp pointed withall: they alwaies tell of winds toward: but vpon the fourth day especially, this rule faileth not, for that day telleth truest. Now if that vpper horne of hers only which bendeth Northward, appeare sharpe pointed and stiffe withall, it presageth wind from that coast: if the nether horne alone seem so, the wind will come from the South: if both stand streight and pricking at the point, the night following will be windie. If the fourth day after her change, she haue a red circle or Halo about her, the same giueth warning of wind and raine. As for *Parro* he (treating of the presages gathered from the Moone) writeth thus: If (quoth he) the new moon when she is just foure daies old,

put her horns direct and streight forth, she presages thereby some great tempest at sea presently to follow, vnlesse it be so that she haue a guirland or circle about her, and the same cleer and pure; for then there is good hope that there will be no foule nor rough weather before the full. If at the full, one halfe of her seeme pure and neat, a signe it is of a faire season; if it be red, the wind will be busie; if enclined to blacke, what else but raine, raine. Doe you see at any time a darke mist or cloud round about the body of the moone? it betokeneth winds from that part where it first breaketh: and in case there be two such cloudie and mistie circles enuironing her, the tempest will be the greater: but how if there be three of them for failing, and those either black, or interrupted, distracted and not vnited? surely then there will be more storms & more. The new moone whiles she is croissant, if she rise with the vpper tip or horne blackish, telleth beforehand that there will be store of raine after the full, and when she is in the wane: but if the nether tip be so affected, the rain will fall before she be at the full. But what if that blacknesse appeare in the middle of her body betwene; then (saith Varro) it will poure of rain in the very full. A full moone hauing about her a round circle, sheweth that there will be wind from that part, where the said circle is most splendant. If her hornes appeare when she riseth, more grosse and thicke than ordinarie, look soon after for a terrible tempest and a stormie weather. If she shew not in our Horizon before the prime or fourth day after the change, and the West wind blow withall, then that moone throughout threatneth cold and winter weather: and if the day after the full she seeme extraordinarily enflamed, she menaceth vnto vs sharp shewes and bitter tempests. Finally, in every moon there be eight points and so many daies (according as she lighteth vpon the angles of the Sunne) which most men obserue onely, and take their presages of future weather by, to wit, the third, seuenth, eleuenth, fifteenth, nineteenth, one and twentieth, seuen and twentieth, and the very day of her conjunction or change.

In the third place, a man may know the disposition of the seasons by the fixed starres, and therefore it behooueth to obserue and marke them. They seeme otherwhiles in the sky to sit and run too and fro, and then we shal not be long without great winds, rising from that quarter where such appeared and gaue token.

The starrie skie, if it shew cleare and bright al ouer, and in every part alike, during that particular season [namely, between the occultation of the Harp-star, and the Equinoctiall point] which I proposed and set downe heretofore, it is a fore-token of a faire and drie Autumne, but yet cold.

If the Spring add Summer both, passed not cleare without some raine and wet weather, it will be an occasion that the Autumne following shall be drie, and lesse disposed to wind; howbeit, thicke, muddy, and enclined to mists. A faire and drie Autumne, bringeth in alwaies a windie winter.

When all on a sudden the stars lose their brightnesse and looke dim, and that neither vpon a cloud nor a mist in the aire, it signifieth either raine or grievous tempests.

If the starres make semblance as if they flew vp and down many together, and in their flying seem whitish, they denounce winds from that coast where they thus do shoot. Now if it seeme to the eye, as if they ran and kept one certaine place, those winds will hold and sit long in one corner: but in case they do so in many quarters of the heauen, they betoken variable and inconsistent winds, going and coming, and neuer at rest. [When you see a circle about any of the other fixe planets or wandering stars, you shall haue powring shewes soone after.] Within the signe Cancer, there be two prettie stars which the Mathematicians call Afelli, [i. little Affes] betwene which there seemeth to be a small cloud taking vp some little roome, and this they name in Latine Præsepia, [i. a Crib, Cratch, Bowzey, or Manger:] now if it chauce that this Racke or Crib appeare nor, and yet the aire bee faire and cleare otherwise, a signe it is of cold, foule, and winter weather. Also if one of these two little stars, to wit, that which standeth Northerly, be hidden with a mist, then shall you haue the South wind to rage; but in case the other which is more Southerly, be out of sight, then the Northeast wind wil play his part.

As touching the Rainbow, if it appear double as if there were two of them at once, it telleth of raine toward. A Rainbow presently after raine, is a signe of faire weather: but this is not so certaine, neither will it hold long. Also, when a man seeth new circles still about any planets, there will be much raine soone after.

In Summer time, if there chauce to be more thunder than lightning, it threatneth winds from

from that coast where it thundreth: contrariwise, if it lighten much & thunder little, looke for rain plentie: when you see it lighten, and the skie otherwise cleare & faire, it is a token that rain and thunder will follow thereupon, yea and rigorous cold weather besides: but the cruellest and most bitter impressions of the aire, ensue vpon such lightnings: as come from all the foure quarters of heauen at once: if it lighten, from the North-west only it betokens rain the day following; if from North, it is a signe of wind from thence: if from the South, Northwest, or full West, it happen to lighten in the night & the same be faire, it sheweth wind and rain from out of those coasts: more thunders foreshew winds, but if they be heard at noon, they presage rain.

As touching clouds, if you see the rack ride apace in the aire, the weather being faire & drie, looke for wind from that quarter whence those clouds doe come; and if they seeme to gather thick in that place, dispeared they will be and scattered when the Sun approacheth: but more particularly, if this happen from the Northeast, they portend rain; if from the South, storm and tempest: if at the Sun setting the rack seeme to ride from both sides of him into the open aire, they shew of tempests toward: if the clouds be very blacke, flying out of the East, they threaten rain against night: but if they come out of the West, it will surely raine the morrow after, if the clouds be disparked many together out of the East, and flie like fleeces or flocks of wooll, they shew rain for 3 daies after: when clouds flie low, and seeme to settle vpon the tops of the hills; looke shortly for cold weather, contrariwise, if you perceiue those tops of mountaines cleare without moist or cloud, the weather will soone take vp and turne to be faire: when the clouds seeme to be heauily charged and full, and yet looke white withall (which * constitution of the aire is called commonly the white weather) there is an haile-storme at hand: moreover, be the skie neuer so cleare, the least cloud appearing therein, is enough to engender and foreshew wind and storme: mists if they come downe and fall from the mountaines, or otherwise descend from heauen and settle vpon the vallies, promise a faire and drie season.

Leauing the stars and clouds above, let vs come to our fires that we make and keepe in our houses here beneath, for they are to be raunged in the next place of our prognostication. If the fire then burne in the chimney pale, and keep there with a huzzing noise, we find by experience it foreshewes tempest and stormie weather: as also wee may be sure of rain, in case we see a fungous substance or foot gathered about lampes and candle snuffs: if you see the flame either of fire or candle mount winding and wauing as it were, long you shall not be without wind. The like is to be said of fire and candle light, if either they seem to go out of themselves, or to kindle and take fire with much adoe. Also, when we discern in the fire a number of sparkles gathered together and hanging one to another: or if when the pot is taken off from the fire, the coles sticke to the bosome and sides: or when the fire being raked in embres, keepeth a spitting and sparkling from it: also, if the ashes lying vpon the hearth grow together: and last of all, when the liue-cole shineth brighter or scorcherh more than ordinarie, all these be signes of rain.

Go we a little lower to the water, for that element also giues signes of the weather: and first of all, if you see the sea within the haue, after the floud is gone, in a low and ebb water to bee calme, and yet heare it keep a rumbling noise within, it foreshewes wind: if it doe thus by times and fits one after another, resting stil and quiet between whiles, it presages cold weather & rain. Item, if in calme and faire weather the sea stonde or water banks resound and make a noise, it is a token of a bitter tempest: so it fares also with the very sea it selfe, for if it be calme, & yet make a roaring, or if the some thereof be seen to scatter to & fro, or the very water to boile & buble, you may be bold to foretell of tempests: the Puffins also of the sea, [i. fishes named in Latin Pulmones] if they appear swimming about water, foregnifie cold weather for many daies together: oftentimes the sea being otherwise calme, swell, & by howing higher than ordinarie, sheweth she had wind good store enclosed within her, which soon after will breake out into a tempest.

Let vs come aland againe, and marke the disposition of woods and hills: you shall heare the mountains and forests both, keep a founding and rumbling noise, and then they foretell some change of weather, nay you shall mark the leaues of trees to moue, flicker, and play themselves, & yet no wind at all stirring, but be sure then you shall not be long without. The like prediction is to be gathered by the light downe of either poplars or thistles flying too and fro in the aire; also of plumes and feathers floring vpon the water. Goe downe lower to the vales & plains: if a man chance to heare a bustling there, he may make account that a tempest will follow. As for the rumbling in the aire, it is an vndoubted signe and token thereof.

G g g

More-

* Some call them Towers.

Moreover, the verie bruit and dumb creatures preface and giue warning what weather there will be. To begin with the fishes of the sea: the dolphins playing & disporting themselves in a calme water, doe certainly fore-shew wind coming from that coast whence they fetch these frisks and gambols: contrariwise, if they fling and dash water this way and that way, the sea at that time being rough and troubled, it is an infallible signe of a calm and of faire weather toward. The Cuttle or little Calamarie Loligo, launching it selfe and flying about the water; the Cockles & winkles cleauing and sticking hard to the grauell, the Sea-vrchins thrusting themselves into the owse and mud, or otherwise balaied & couered with sand, beall signes of tempests neare. The like may be said of Froggs, when they crie more than their custome is, and of Seamews also, when they gaggle in a morning betimes extraordinarily, semblably, the Cormorants, Gulls, Mallards, and Ducks, when they keep a proining of their feathers with their bills, foreshew wind: and generally, when you see other water-foule to gather and assemble together and then combat one with another, or Cranes make hast to flie into the midland parts of the maine. The Cormorants and Gulls flying from the sea and standing lakes, and Cranes soaring aloft in the aire still, without any noise, doe put in comfort of a faire and drie season: so doth the Howlar also, when she cries chuiit in rainie weather: but if it be then faire and drie, we shall be sure to haue foule tempests for it afterwards: Rauens crying one to another as if they sobbed or yexed therewith, and besides clapping themselves with their wings, if they continue this note, doe portend winds; but if they giue ouer between-whiles, & cut their crie short as if they swallowed it backe again, they preface rain and wind both. Iacke-dawes, if it be late ere they returne from their reliefe abroad, foretold cold and hard weather; so do the white-birds when they assemble and flock together, as also when land-foule (and the crow especially) keep a crying against the water, clapping their wings, washing also & bathing themselves. If the Swallow flie low and so neere the water, that the flap the same oftentimes with her wings, it is a sign of rain and foule weather. Semblably, all other birds that nestle in trees, if they seem to make many flights out, but returne again quickly to their nests. Moreover, if Geese hold on a continuall gagling out of all order vntunably, a man may guesse no better by them, no more than he can of the Heron which he seeth heauy and sad vpon the sands.

And no maruell that these riuer-foules, or generally any other birds of the aire whatsoever, should haue a secret preface and foreknowledge of the disposition of the aire, for the very four-footed beasts of the earth doe make shew thereof by their behauiour. The sheep and such small cattraile, leaping and playing wantonly, dancing also as vntowardly without measure, doe testifie some change of weather: nay the dull and heauie oxen holding vp their nose and muzzles, snuffe and smell into the aire, yea and keep a licking against the haire [toward rain.] Also when you see the foule and filthie hogs, rend, teare, and fling about them bottles of hay, and yet they care not for it when they haue done, because it is no meat for them: likewise if you perceiue the pismires or ants either lying close and idle, full against their nature (whose propertie is to be industrious and euer busie) or encountering one another in battailewise, or else carying their eggs abroad out of their holes. Finally, when the mads or earthwormes come forth and appeare, a man may be bold to foretel of a change in the weather.

What should I say more? It is knowne for certaine, that Clauer-grasse or hearbe-Trefoile will looke rough against a tempest, yea and the leaues thereof will stand staring vp as if it were afraid thereof. And to conclude and make an end once of this discourse, whensoever you see at any feast the dishes and platters wherein your meat is serued vp to the board, sweat or stand of a dew, and leauing that sweat which is resolu'd from them either vpon dresser, cupboud, or table, be assured that it is a token of terrible tempests approaching.

were at *Rome*. *ibid.*
a *Mare* in soile wan the prize in the *Olympian* race. 304.g
Mares better than stallions in war seruice in *Scythia*. 222.l
Mares conceite by the wind. *ibid.*
Mares how they be brought to admit *Asses* to couer them.
303.e.
Mares with sole labour as well as before. 303.f. they steale
their sowing many times. 304.g
Margarides, Dates. 387.b
Margo, a kinde of *Limestone*. 505.d
Mario a fish of pleasant tast. 243.b
Marioram oyle the best. 382.g
C. Marius commended by *Sylla* *Felix* for building a man-
nor house in the country. 554.i
Marmosets where bred. 106.g
Marmotanes their nature. 226.m
Maorine, what *Olives*. 432.g
of *Marrow*. 344.l. m
Marrow neuer found but in hollow bones. 344.l
Marrow of the Vine tree and nature thereof. 526.i
Marrow of the backe descendeth from the braine. *ibid.*
Marrow of a mans backe proneth a snake. 305.b
Marsians endued with a vertue against serpents. 154.l
Mars his nature and motion. 6.g
Mars his course least of all others can be obserued. 12.m
his colour. 13.c
Mars his motion and light. 10.b
Mars as hung himselfe in a *Plane* tree. 495.d
Marsians descended from *ladie* *Circus* sonne. 154.l
Maria, the name of a ladie, which was stricken with
lightening, being great with child, her child killed, and
shee without harme. 25.f
Martines, enemies to Bees. 292.i
Martines called *Apodes*. *ibid.*
Martines or *Martinetes*. See *Swallows*.
Martius *Musfican* stone with *Apollo*. 107.b
Martius in an Oration of his, his head was on a flaming
fire. 48.b
Mastis trees honored especially by the *Romanes*. 456.g
Mast, a great reuenes in some countries. *ibid.* ground
for bread. *ibid.* served up to the table for delicates.
ibid.
Mast of different kinds. 456.b
beech *Mast* sweetest of all others. 458.i

beech *Mast* described. *ibid.* k
Mast of sundry trees. *ibid.* l
Mast differ sundrie waies. 459.a
Mast which is best for feeding cattell. 459.e. f
Mast of a ship of maine bignesse. 489.e
Mast tree how it groweth. 523.f
Mastike tree sheweth three reasons of plowing ground. 599.b
Mastike the resin of the *Lentiske* tree. 424.g
Mastike gum. 369.c. the best. *ibid.* f. issueth of the *Len-*
iske tree. 370.g
of the *Matrice*. 344.g. h
Matrimacians their presumptuousnesse. 15.b
Matutine rising or setting of fixed starres. 387.d
Manifes change their colour. 285.f
Mauitania, the description thereof. 90.i

M E

Measure of the sea. 149.d
Measure of the parts of the world. *ibid.* e
Meadow grounds how to be chosen and ordered. 595.b. when
to be mowed. *ibid.*
Medea burnt her husbands concubine by force of *Naptha*.
47.a.
Meadows called *Prata* or *Parata*. 553.f
Media the desc: p:ion thereof. 122.i
Medica described 573.b. how and where to be sowed. *ib.* c. d
a singular forage. *ibid.*
Medicines not applied in due season, be mischiefs. 546.g
Melampus taught to understand birds language. 296.l
Meitiei, dogs, whence so called. 71.f
Meleandria. 213.d
Melaria, a towne. 51.d
Members of mens bodies of miraculous effects. 168.b
Memorie lost by sundry occasions. 155.
Memorie rare examples. 167.f. reduced into art. 168.g
Members genitall of a bone substance. 352.b. in what
creatures. *ib.* are medicinable for the disease of the stone. *ib.*
Memmonides, birds. 284.k
Memphis, sometime neere the sea. 36.e
Men slaine for sacrifice. 154.g
Men conuersing generally with beasts. 154.b. their defor-
mitie and swiftnesse. *ibid.*
Men headed like dogs, their manners. 155.e
Men above fine cubits tall, their strong constitution of bo-
die. *ibid.*
Men without noses and mouthes in *Egypt*. 146.l
Men that know not the use of fire in *Egypt*. *ibid.*
Men that goe ever naked. 177.b
Men eight cubits high, called *Olaby*. 147.b
Men headed like dogs, called *Cynamolgi*. *ibid.* e
Men in *Ethiopia* which liue onely on wild locusts. 147.f
Men and women greatest footed for their proportion. 150.d
Men surnamed of trees. 499.c
Men made to husband the earth. 516.g
Men weigh heavier than women. 165.e
Men haue been slaine and yet not bled. *ibid.*
Mencanonzied, wherefore. 54.g. their strange shapes. 155f
Menoba, a river. 52.i
Mentor plucked a spillout of a lions foot. 203.b
Mercurie, so named to expresse his nature. 4.g
Mercurie his nature and motion. 6.k. of some called *A-*
pollo. *ibid.*
Mercurie

The Table to the first Tome

<i>Mercurie his stations. I. o. i. wherefore his starre differs not from the Sunne above three and twentie degrees.</i>	12.b	<i>Misseto of three kinde.</i>	496.g

THE HISTORIE OF THE WORLD.

Commonly called,
THE NATVRAL HISTORIE OF
C. PLINIVS SECVNDVS.

Translated into English by PHILEMON HOLLAND,
Doctor of Physicke.

The second Tombe.

LONDON,
Printed by Adam Jlsip.
1634.

TO THE READER.

Or as much as this second Tome treateth most of Physicke, and the tearms belonging thereto (as wel concerning diseases as medicines) be for the most part either borrowed from the Greek, or, such as the vnlearned be not acquainted with (which partly vpon necessity I was forced, and partly for varietie induced to vse) I could not content my selfe to let them passe without some explanation: for since my purpose especially is to profit and pleasure the most ignorant (for whose sake *Plinie* also himselfe, as hee professeth, compiled this worke) I would not be so iniurious vnto them as to interrupt their reading with obscuritie of phrase, when the matter otherwise is most familiar. In regard whereof, I thought good to prefix a brieue Catalogue of such words of Art, as euer and anon shall offer themselves in these discourses that insue, with the explanation thereto annexed, and the same deliuered as plainly as I could possibly deuise for the capacity of the meane. In the handling whereof, so I may satisfie my countrymen that know no other Language but English, I shall thinke my paines and labour well bestowed, and lesse feare the censure of those that haply expect some deeper learning; for euer still
A 2 the

TO THE READER.

the verse of that Comickall Poet resoundeth from the stage
in mine eares,

αὐτὸς ὁ ποιητὴς ἑαυτοῦ ἀποφασίζει. (id est)

Speake with lesse shew of learning, so is be with more perspe-
cutive. Vale.

A brieft Catalogue of the words of Art, with the Explanation thereof.

A

A *Bort*, or *Abortive* fruit, is an vtinely
birth.

Absterfue, i. scouring, cleansing, or wi-
ping away, such as the Greekes call *Sme-*
ctica, and they enter into sope & washing
balls.

Accesse, i. a fit, whether it be of an Ague, fal-
ling sicknesse, or any such diseases as re-
turne at times.

Actabulum, or *Actable*, a measure among the
Romans, of liquour especially, but yet of
dry things also, the same that *oxybaphon*
in Greeke: and for that, as both words do
import, they vsed to dip their meats in vi-
negre out of such, it may wel go for a sau-
cer with vs; for it contains, as some think,
fifteen drams, which grow neere to two
ounces, of which capacitie our small sau-
cers are: but as others suppose, it receiues
two ounces and an halfe, the measure of
ordinary saucers.

Acrimonic, i. Sharpenesse.

Actually, i. sensibly and presently, as fire is a-
ctually hot.

Aduiales, or *Adycales epula*, were great and
sumptuous feasts or suppers, held by the
Pontifices or high Priests in testimony of
publique ioy.

Almonds, see *Amygdals*.

Amphora, a measure in Rome of liquors only:
it seemes to haue taken that name of the
two ears which it had of either side one: it
contained 8 Congios, which are much a-
bout 8 Wine gallons, or rather betweene
seuen and eight: so as in round reckoning
it may go for a ferkin, halfe kilderkin, or
half scestern with vs.

Amygdals be kernils at the root of the tongue
subiect to inflammations & swellings, oc-
casioned by deflux or falling down of hu-
mors from the head: they be called *Anti-*
ades, *Paristhnia*, & *Tonilla*: the foresaid
infirmities also incident vnto them, doe
likewise cary the same denominations.

A

Antidotes, i. countrepoysons, properly, defen-
satiues or preseruatiues against poyson, pe-
stilence, or any maladic whatsoeuer.

Antipathie, i. contrarietic, enmity, and repug-
nancie in nature, as between fire and water,
the vine, and the Colewort, &c.

S. Antonies fire is a rising in the skin occasio-
ned by hot bloud mixt with abundance of
choler, and such be the shingles and other
wild fires called in Greeke *Erysipelas*.

Aquosities be waterish humors apt to engen-
der the dropsies called *Ascites* and *Leuco-*
phlegmatia.

Aromatised, i. Spiced.

Arthriticall griefes, such as possesse the ioints,
as all the sorts of gout.

Astrictiue or *Astringent*, be such things as bind
the body, or any part thereof.

Attractiue, i. drawing, as the loadstone draw-
eth iron, amber straws or bents, *Dictamnus*
arrow heads or spils out of the bodie, and
cupping glasses (or ventoses) humours and
wind.

Austere, harsh or hard, as in fruits vnripe, and
hard wines of hedge grapes.

Axinomanie, a kind of magicke diuination by
an ax head red hot.

B

B *Asis* in a compound medicine is that drug
or simple which is predominant, and cari-
eth the greatest force in it, as the ground
thereof, whereupon the whole taketh the
name; as Poppy in *Diacodion*, *Quinces* in
Diacydonium, &c.

Bole is the form of a medicine when it may be
giuen in grosse manner at a kniues point to
the quantitie of a nutmeg at a time, vntill
the whole receit be taken.

Browning, a term vsuall in the mouths of ma-
riners and winnowers of corne, when they
are calmed and do call for wind.

Bulbes, although *Pliny* seemed to giue that
name vnto some one speciall hearbe, yet it

A 3

signifieth

The explanation of

signifieth generally all those as haue round roots, as Onions, Squilla, Wake-robin, and such like; whereupon these and other of that kind are said to haue bulbous roots.

Cacochymie is that indisposition of the body in which there is abundance of humors.

Calcinig, i. the burning of a mineral, or any thing, for to correct the malignitie of it, or reduce it into powder, &c.

Callositie, thicknesse and hardnesse of skinn in maner senslesse, as in fistulaes, and vnder our heeles.

to Carminat, is to make more fine and thin the grosse humors, by such medicines as by their heat are apt to cut and dissolue them; whereupon they likewise be called **Carminatiue**, a terme receiued by Apothecaries, and borrowed from those that card wooll.

Cancer is a swelling or fore coming of melancholy blood, about which the veins appeare of a blacke or swart colour, spread in manner of a Creasie clec; whereupon it tooke that name in Latine, like as in Greek **Carcinoma**. And such vlcers as in that sort be maintained and fed with that humor, are called cancerous, and be vtoward to heal, worse commonly for the handling.

Carnositie, i. fleshy substance.

Cataplasme, a pulstesse or grosse maner of plastre

Cartilage in man and beast is a gristle, in roots and fruits, that substance which we obserue in the radish root, and the outward part of a cucumber, as *Pliny* seems to take it, which thereupon be called Cartilaginous.

Cataract is a dimnesse of sight caused by an humor gathered and hardened betwene the tunicle of the eye, called Cornea, and the Crystalline humour; it is next cousin to blindness.

Causick, i. burning, blistering, or scalding.

to Cauterise, is to seare or burne by a Cauterie.

Cauterie actual is fire it self or scalding liquor: and so a searing iron, gold, or other metall made red hot, is called an Actual cauterie, which without the help of our natural heat doth work presently.

Cauterie potentiall is that which will raise blisters and burn in time, after it is once set on work by the heat of our body, as Cantharides, Spewwort, &c.

Ceres the first inuentress of the sowing & vse of corne.

Cerate is of a middle nature betwene an ointment and a plaister, not so hard as the one, nor so soft as the other.

Cicatrices in eyes be whitish spots, otherwise called pearls: they be the skars also remaining after a fore is healed vp: and so a place is said to be cicatrised, when it is newly skinned vp and healed.

Circulation is the deuise of subliming or extracting water or oile by a stillatorie, a lembick, or such, because the vapor before it be resolued into water or oile, seemes to go round circlewise.

Clysterised, i. conueyed vp by a clyster into the guts.

Coliaci be those that through weakenesse of stomacke are troubled with a continuall flux of the belly.

Colature, a thin liquour that hath passed thorow a strainer or colander.

Colliquation is a falling away and consumpti- of the radicall humour or solid substance of the body.

Collyries, are properly medicines applied to the eies in liquid forme; whereas the dry kind be rather called Sief & Alcohol, especially in powder: howbeit *Pliny* attributeth this terme to all eye-salues whatsoever. Also it seemeth that hee meaneth thereby, tents to be put in a fistulous vlcere, as in pag. 509 b. 510 k.

Collution, a liquour properly to wash the mouth, teeth, and gums withall.

Concocted, i. altdred to that substance by natural heate, as either in health may serue to nourish, or in sicknes is apt to be expelled

Consolidat, to knit, vnite, & make found again that which was broken or burst.

Concrete, i. hardened and grown thicke.

Conditio, i. preserued in some conuenient liquor.

to Concorporate, i. to mix and vnite together into one masse.

Consistence, i. substance or thicknesse.

Constipate, i. to harden and make more fast and compact.

Contraction of sinews, a shrinking or drawing of them in too short.

Contusions, i. Bruises.

Convulsions, painfull cramps.

Criticall daies be such, as in short diseases & those of quicke motion, do giue light vnto the physitian of life or death. *Pliny* obserues the odd daies to be most significant, and those vsually determinof health; and the euen days contrariwise: so that the seventh is *Rex*, i. a gracious prince, the sixth *Tyrannus*, i. a cruell tyrant.

Cruditie.

the words of Art.

Cruditie. See Indigestion.

Cyath, a small measure both of liquid and drie things; the twelfth part of a setarius, which was twenty ounces: whereby it appeareth, that a cyath was one ounce, one half ounce, one dram, and one scruple: it may goe with vs for foure ordinarie spoonfulls.

Cubit, a measure from the elbow to the middle finger stretched out at length, which went ordinarily for 24 fingers bredth, or 18 inches, which is one foot and a halfe: yet *Pliny* in one place maketh mention of a shorter cubit, namely from the elbow to the end of the fist or knuckles, when the fingers be drawn in close to the hand.

Cutaneum eruptions be such wheales, pushes, or scabs as do breake out of the skin and disfigure it.

D

Debilitie, i. weaknesse or feeblenesse.

Decoctio, a liquor wherein things haue bin sodden.

Decretorie daies, be such as in a sicknesse shew some chaunge or alteration in the patient, either for good or bad.

Defensatiue, in medicines taken inwardly, are such as resist venom or pestilent humor: in outward applications, such as defend the fore or place affected from the flux or fall of humors thither.

Denarius, a coin of siluer in Rome, and in other countries of gold, the same that Drachma Attica, i. a dram in weight, which is *vij. d. ob.* of our mony; and the piece in gold answereth neere to a full French Crowne; in poise it goeth for a dram.

Dentifrices, are meanes in Physicke to preserue the teeth, and make them white and faire.

Depilatorie are those medicines which either fetch off the haire, or hinder it from coming vp againe at all, or at leastwise from growing thicke. They were called in Greek and Latine both *Psilothra*.

Desiccative, i. drying.

Digestiue be those medicines which taken inwardly, helpe concoction of meate or humors; or applied without vnto a sore, doe comfort the place, and makeway for speedie healing.

Dislocations, when the bones be either out of ioynt, or else displaced.

to Dissipate, i. to open.

to Dissipate, i. to scatter and dispatch.

Distortion, crookednesse or turning awry vnnaturally.

Diureticall, such things as prouoke vrine.

Dose, i. that weight or quantitie of any medicine that may be giuen either conueniently or without danger to the patient.

Dram, the eight part of an ounce, which is the weight of a Roman denier, or Denarius.

Dysenteric, is properly the exulceration or sore in the guts, whereupon ensueth besides the painefull wrings of the belly, a flux also of blood at the siege, and therefore it is vsually taken for the bloody flux.

E

Etiologies. See Etiayls.

Electuaries, be medicinable compositions or confections to be taken inwardly, made of choise drugs, either to purge humors, to strengthen the principall parts, or to withstand any infirmities for which they are made. The substance is betwene a syrrop and a Conserue, but more inclining to the consistence of conserues.

Eidylls, or Eidyllia, be small poemes or pamphlets written by Poets, such as *Theocritus* in Greeke compiled, and much like vnto the Pastorals or Eclogues of *Virgill* in Latine.

Embrochation is a deuise that physitians haue for to foment the head or any other part, with a liquor falling from aloft vpon it, in manner of rain, whereupon it tooke the name in Greeke Embroche, and hath found none yet in Latine, vnlesse we should vse Superfusio.

Emollitiues, medicines that do soften any hard swelling.

Empiricks were those physitians, who without any regard either of the cause in a disease, or the constitution and nature of the Patient, went to worke with those medicines whereof they had experience in others, fall it out as it would.

Empirick books of *Diodorus* contained receits approoued and found effectually by experience.

Emunctories be those kernelly places in the body, by which the principall and noble parts doe void their superfluities, or such things as offend; to wit, vnder the ears for the brain, the arm-pits for the heart, and the shere for the liuer, &c.

Empla.

The explanation of

Emplastration in the Hortyard, is grafting by inoculation with a scutcheon in Phy sicke, the applying of a salve or plastre.

Epilepsie, i. the falling sicknesse.

Errhines be deuises made like tents, sharper at one end than the other, to bee put vp into the nose, either to cure some vicer there, or to draw downe and void humors out of the head, or to prouoke sneezing, &c.

Eschare, is that crust which ariseth vpon a cauterie, either a ctuall or potentiall, as also the roufe or scab that groweth vpon a sore.

Euationation, i. Voidance and riddance of any thing out of the bodie by vomite, purging, bleeding, sweating, &c.

Excelsaforie, i. Heating or chaufing.

Excoriation, i. fretting the skin off, when a part is made raw: a way to exulceration.

Exerescence, i. ouergrowing vnnaturally of any thing in mans bodie.

Exoticall i. forraigne, and brought from other countries.

Exorcismes, i. coniuurations by certain charmes and spels.

Exorcists, they that practised such Exorcismes. To **Expectorare**, i. to rid and discharge out of the breast by coughing or reaching.

Expiaatorie, were sacrifices or oblations for to make satisfaction and atonement.

Exiccative. See **Deficcative**.

Extenuat, i. to make thin.

Exulceration, i. a forenesse of any part inward or outward, when not onely the skin is off, but the humor doth fret deeper still.

Exulceratiue, be such things as are apt to eat into the flesh and make an vicer.

F

Fermentation, i. an equall mixture of things working as it were together: a tearme borrowed from the leuaine, which disperfeth it selfe into the whole masse or lump of dough.

Filaments bee the small strings that hang to a root like threads or haire, which some call the beard of the root: and in resemblance thereof, other things growing likewise, bee so called.

Fiffures, clifts or chaps, whether it bee in the hands, feet, lips, or fundament.

Flatuofities, i. windinesse gathered within the bodie.

Flora, the goddesse of floures among the Paimns.

Fomentations properly be deuises for to be applied vnto any affected part, either to comfort and cherifh it, or allay the paine, or els to open the poores to make way for ointments and plastes. If they be liquid things they are laid too by the means of bladders, fponges, or such like: if drie, within bags or quilts.

Fractures, i. bones broken.

Fricions or **Frications**, rubbings of the bodie vpward or downeward gently or otherwise, as the cause requireth.

Frontall, the forme of an outward medicine applied vnto the forehead, to allay paine, to procure sleepe, &c.

Fukes, i. paintings, to beautify the face in outward appearance. They are called at this day complexions, whereas they bee cleane contrarie: for the complexion is naturall, and these altogether artificiall.

Fumofities bee vapours steaming vp into the head, troubling the braine.

Fungous, i. of an hollow and light substance like to Fuffes or Mushromes.

G

Garga risines bee collutions of the mouth, and parts toward the throat, either to draw downe and purge humors out of the head, or to repress and reftreine their flux, or to mundifie and heale any fore there growing.

Gargarifing or **Gargling** is the action of vsing a liquor to the said purpose.

Gestation, an exercise of the bodie, by beeing carried in coach, litter, vpon horsebacke, or in a vessell on the water.

Glandulous swellings. See **Kings euill**.

Gleir, i. the white of an egge.

Gymnicke exercises, were those that were performed by men naked, and the place for such exercises, was thereupon called **Gymnasium**.

H

Habit of the bodie, is taken for the outward parts thereof, opposit vnto the bowels and principall within, which being comforted and fortified, do thrust forth offenseue matters to the habit and exterior skin.

Hemine, a measure in Rome, as well of liquors as drie things: so called, because it was half Sextarius: it contained ten ounces, and is somewhat

the words of Art.

somewhat vnder our wine pint, it is the same that **Cotyla** in Greeke.

Humiditie, i. moisture.

Hydromantia, a kinde of magicall diuination or foreknowledge of things to come, by obseruation of the water.

Hydrophobie, is a symptome or accident befalling to them that are bitten by a mad dog, whereby they are afraid of water.

Hypochondriall parts, be the flanks or soft parts vnder the short ribs.

I

Ilike passion, the wrings and torments of the vpper small guts, occasioned by wind or sharp humors. Some improperly call it the collicke of the stomacke.

Imbibition, a drinking or receiuing of any liquor into a thing: as when drougs lie steeped therein vntill they be thoroughly soaked therewith.

Impostumes properly be collections or gatherings of winde and humors especially betwene parts of the body, whereupon there appeareth a rising or swelling, and in time they become corrupt and do rankle, vnlesse by some meanes they be either drawn away or disperfed. Some terme them wens, howbeit, the word is taken for inflammations and biles.

To **Incorporate**, is to mixe and vnite well together.

To **Incrassate**, is to make thicke.

Indigestion, i. want of concoction and digestion, by which means many crudities & raw humors are ingendered, & by consequence abundance of rheumes.

Inflation, i. swelling or puffing vp with winde.

Infrangible, i. that cannot be broken.

Infusion signifieth the conuenance of some medicinable liquor into the body by clystere or other instrument. It importeth also the steeping of drougs in a conuenient liquor: and the liquor it selfe, when it is strained from the rest.

Ingredients, be those simples that goe vnto the making of any medicine compound.

Iniection, is the conuenance of any liquid medicine by syringe or such like instrument into any part of the body or hollow and fistulous vicer.

Insects, little vermine or smal creatures, which haue (as it were) cut or diuision betwene their heads and bodies, as Pismires, Flies,

Grashoppers, vnder which are comprehended Earth-wormes, Caterpillars, &c.

Infusions be bathing tubs or vessels halfe full, wherein the patient may sit vp to the middle or about in some conuenient decoction

Intermittent feauer, are those which come by fits, and yeeld some rest betwene whiles.

Inunction, i. anointing.

Iulebs or **Iuleps**, be drinckes giuen commonly as preparatiues for to open the passages of the inward parts, and to prepare the humors for a purgation, made either of some stilled waters and syrups mixed together, or of a decoction sweetened with hony or sugar, or els mingled with syrups.

K

Kings euill, is the hard swelling of the Glandules or Kernels commonly about the necke: they be called also **Scrophules**.

L

Lachrymal, is the corner of the eie where in the teares appeare first, and thereof it taketh the name.

Lastitude, is wearinesse or vnlustinesse.

Lauature, **Lotion**, or **Loture**, is a liquor to bathe or wash withall: likewise to cleanse and mundifie any part.

Ligula, **Lingua**, or **Lingula**, a small measure among the Romanes, both of liquor and drie things, containing the fourth part of Cyathus, to wit, three drams & one scruple or scruple, somewhat vnder halfe an ounce, and may goe well for our Spooonefull.

A **Liniment** is thicker than oyle, and thinner than an ointment, it may be taken for a thinner kind of ointment.

Lobes and fibres are the lappets and extreame parts of the liuer, with the master veines growing thereto.

Locall medicines, be those that are appropriate for the forehead, **Errhine** or **Nasal** for the nostrils, &c. or to be applied outwardly, ointments, which are not to be vsed before general or vniuersal means by euacuation.

Loch or **Lobach**, is a medicin more liquid than an electuary, appropriate for the lungs and windpipe, and is to be licked and let goe downe leisurely.

Longaon, is the nethermost gut reaching vnto the very seat or the fundament.

End.

The explanation of

Luted, i. close stopped with clay, dough, or such like.

M

Maturationes be medicins that help to ripen any swelling impostume, bile, or botch. *Maturity*, is the ripenesse thereof.

Membranes, be fine skins which inwrap other parts, as the brains, eies, and muscles of the flesh.

Metrenchyte, an instrument serving to infuse or inject a liquid medicine into the matrice of a woman, in manner of clystire.

Mitigatives, be such remedies as do asswage paine.

Mina, or *Mina*, was a Roman weight, which poised twentie ounces, that is to say, the ordinary pound, called *Libra* or *Pondo*, & two third parts: for the common *Libra* called *Medica*, weighed twelue ounces, so that *Mina* seemed to answer vnto the measure *Sextarius*.

Mollitiue. See *Emollitiues*.

Mordicative, is biting and stinging, as *Senuy* feed.

Mucilage, is a slimy liquor drawne from some roots or seeds, as from the marsh Mallow or *Althea* root, the seed of *Pillium* or *Flewort* and others.

Muscles be the fleshy parts of the bodie, contained within their seuerall membranes or skinnies.

N

Narcoticke medicines, be those that benum and stupifie with their coldnesse, as *Opium*, *Hemlocke*, and such like.

Nasals be Nose-rents. See *Errhina*.

Nerves, i. Sinewes.

Nodosities, hard knubs & knots growing vpon the ioynts in old gouts, and in other parts.

O

Obolus, halfe a scriptule, or the sixt part of a dram.

Obstructions, i. Stoppings.

Opiats, were properly at the first such electuaries or confections, which had a good quantitie of *Opium, i.* the iuice of Poppie in them, such as *Philonium* and *Requies*, that were deuised to mitigate intollerable

paine, and to bring the patient to sleepe: howbeit, in these daies all electuaries, euen cordials, in a liquid form be called *Opiats*; although there be not one grain of *Opium* in them.

Opilation. See *Obstruction*.

Orthopnoicke, are those that haue the disease *Orthopnoea*, which is a difficulty of drawing their wind, vnlesse they sit vp right.

Ostes, be words cast forth at vnwares, presaging somewhat.

Otenchyte, an instrument, deuised for to infuse or poure some medicinable liquor into the eares,

Oxyerate, a mixture of water and vineger together.

P

To Palliat, i. to couer: & such cures be called *Palliatiue*, which searce not to the root and cause, but giue a shew only of cure; as when a sore is healed vp aloft, and yet festereth vnderneath: and so sweet *Pomanders* do palliat a stinking breath, occasioned by a corrupt stomacke or diseased lungs, and such like.

Paradoxes, strange opinions.

Pectorals, i. such medicines as bee fit for the breast and lungs.

Pellicles. See *Membranes*.

Penetratiue, i. Piercing.

Periodicall, such agues be called, as return at their iust course from day to day, euery third fourth, or fifth day, &c.

Peripneumony, is the inflammation of the lungs.

Pessary, is a deuise made like a finger or suppository, to be put vp into the natural parts of a woman.

Phlebotomie, i. blood-letting, or opening of a veine by incision or pricke.

Phthisicke, to speak properly, is the consumption of the body occasioned by the fault of exulcerat and putrified lungs. But *Pliny* otherwise seemeth to take it for any other consumption.

Pomona, a deuised goddesse amongst the *Painims*, of apples and such fruits.

Prodigies bee strange sights and wonderfull tokens, presaging some fearefull thing to come.

Propinquitie, nearnesse or affinity.

Proscription, was a kind of outlawing and depriving a man of the protection of the state, with

the words of Art.

S

Saluation, is a drawing of humours to the mouth, and a deliuerie of them from thence in manner of spittle.

Sarcling is the baring of roots, by ridding away the earth and weeds from about them, that did clog them.

Scarification, is a kind of pouncing or opening of the skin by way of incision slightly, with the fleame or lancet, either to giue some issue for the blood and humours to passe forth, or prepare a place for the cupping-glasse to extract more.

Schirre, is a hard swelling almost fencelesse.

Scriptule, or *Scruple* is foure and twenty grains weight, or the third part of a dram.

Scrophules. See *Kings euill*.

Seat, is the circumference or compasse about the tuill or fundament.

Secundine, i. the afterbirth that infolded the infant within the mothers wombe.

Sege, a stoole of ealement, whereupon wee sit to discharge the order and excrements of the guts.

Serofities, or *Serous humors*, be the thinner parts of the masse of blood, answering to the whey in milke, such as we see to float vpon blood that hath run out of a veine.

Sextarius, a measure among the *Romanes*; wherof six goe to their *Congius*, wherupon it tooke that name: it contains two hemines, and is somewhat lesse than a wine quart with vs, it beareth twentie ounces.

Sinapisme, a practise by a plaster of mustard seed, and such like, to reuiue a place in manner mortified, and to draw fresh humors & colour to it.

Solstice, i. the Sunnestead, as well in winter as Summer, when hee is come to his vtermost points North and South, but vually it is put for Mid-summer onely.

Sophisticated, i. falsified & made corrupt, howbeit, going for the right. Thus drougs and gems are many times thrust vpon vs.

Spasmes, be painefull crampes or pluckings of the sinewes and cords of the Muscles.

Spasmatike, are such as be thus plucked. *Species*, be either the simple ingredients into a composition, or else the bare powders mingled together, ready to be reduced into an electuarie liquid, or Tables.

Speculative knowledge, or *Speculation*, is the insight into a thing by reading only & contemplation

with confiscation of his lands and goods. *Propagat*, to grow and increase, after the manner of Vine branches, which being drawne along in the ground from the motherstock do take root.

Propitius, i. gracious and mercifull.

Proximitie, neere neighbour-hood or resemblance.

Prisane, the decoction of husked Barley: a grewell made therewith, or the creame thereof.

Pulpous, i. full of pulpe, or resembling pulpe, which is the soft substance in Apples or such fruits, answerable to the flesh in liuing bodies.

Purulent, yeelding filth and Attyr.

Putrefactiue, such venomous medicines or humors, as do corrupt and putrifie the part of the body, which they possesse.

Q

Quindecimvirs, were certain officers, fifteen in number, ioined in one commission.

R

Receptorie, a vessell standing vnderneath, ready to receiue that which droppeth and distilleth from something aboue it.

Reciprocall, going and comming, as the tides of the sea ebbing and flowing.

To Rectifie, i. to set streight, to reforme, or amend.

Repercussive, i. driuing or smiting backe.

Residence, i. the setting toward the bottome, as in vrine.

Retentive facultie, i. the naturall power that each part or member of the body hath to hold that which is committed vnto it, the due time, as the stomacke, meat, the bladder, vrine, &c.

Reuerberatiue, i. rebounding or striking backe.

Rhabdies, bee properly the chaps in the fundament or seat.

Rubified, i. made red, as when by application of mustard plastes, called *Sinapismes*; or beating a part that is benumbed with nettles, it recouereth a fresh colour againe, whereupon such plastes be called *Rubificatiue*, and the operation is named by the *Greekes Phoenigmos*.

Rupture, the discale of bursting, as when the guts or other parts fall downe into the bag of the cods.

templation, without practise & experience.
Sperme, is naturall seed.

Spondyles, be the turning ioints of the chine or backbone.

Stomachicall fluxe, is the same that *Cœliaca passio*. See *Calici*.

Stomachicall medicines, be such as are appropriat for the diseases incident to the mouth, and the parts adjoining.

Stypticke, be such things as by a certain harsh tast, doe shew that they bee astringent, as medlars and alumne, which thereupon is named *Stypteria*, and such like.

Succedan, that drug which may be vsed for default of another. The Apothecaries call such, *Quid pro quo*.

Suffusion. See *Cataract*.

Suffumigation, is the smoke that is receiued in to the body from vnder a stool, for the diseases of the guts, fundament or matrice.

Suppuration, is when a bile or impostume gathereth to an head and must be broken.

Sympathie, i. a fellow-feeling, vsed in Pliny, for the agreement or amitie naturall in diuers sencelesse things, as betweene yron and the loadstone.

Symptome, an accident accompanying sickness, as head-ach the ague, stich, shortnesse of wind, spitting blood, cough, and ague, the pleurisie.

Syringe, an instrument in manner of a pipe to iniekt a medicinable liquor into the bladder.

T

Tellus, the earth.

Tenacitie, clamminesse, such as is in glew, birdlime, and Bitumen.

Theoricke, or *Theoretique*, contemplatiue know-

ledge without action and practise.

Tineſme, an inordinat desire to the stool without doing any thing to the purpose.

Tonsils. See *Amygdals*.

Transparent, i. cleare and bright throughout, as cryſtall, amber, aire and water.

Transuſation, i. the pouring of liquor out of one vessell into another.

Triuial, i. vulgar, common, and of base reckoning.

Triumvirat, the Tripartite dominion of *Antonie*, *Octavius*, and *Lepidus*, when they held all the world in their hands, each one their third part.

Trochisques, or *Troſques*, be litle cakes or roundles, into which diuers things medicinable are reduced for to be kept the better, & to be ready at hand when they shall be vsed.

Tuile, the same that the Fundament or nethermost gut.

V

Vegetatiue, that power in nature which God hath giuen to creatures, whereby they liue, are nourished, and grow.

Ventoſitie, windinesse.

Vicinitie, neernesse, or neighborhood.

Victoriat, a silver coine in Rome, Halfe a denarius, so called because it had the image of victory stamped on the one side: it is *loma*, what vnder our goat.

Vnction, anointing.

Vnguent, an ointment.

Vreters, be the passages or conduits whereby the water or vrine passeth from the kidnies into the bladder.

Vulnerarie, i. belonging to a wound; as *Sanicle* is a vulnerary herbe, and *Machaon* was a vulnerarie Physician.

THE NINETEENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

I Related we haue in the former booke, of the stars and signes aboue, which giue vs intelligence as well of the seasons, as the disposition of the weather to come: and that in plaine and easie manner, by so euident and vndoubted demonstrations also, as may content the meane capacitie of the vnskilfull and ignorant. And verily, if we will rightly weigh and consider the thing, we shall find and vnderstand, that our countrey farmes and villages stand vs in good stead to know the inclination of the well and throughly learned, many haue bin of opinion, That the knowledge of gardens and the care thereto belonging, should by good right follow next. Howbeit, I for my part am of this mind, that here be other matters concerning Agriculture, deserue to be handled, before we leape thus soon to gardening. And here I cannot chuse but maruell much at some men, who making such profession of learning, and namely, in the skill and science of Agriculture, as they haue done yea, and seeking thereby to win all their credit and name of erudition and literature, haue notwithstanding omitted many things requisite therunto, without any mention made, or one word spoken of so many herbes and simples which either come vp of themselves, or grow by meanes of mans hand: considering that the most part of them are in greater price and reputation, yea, and in more vse and request far, for the maintenance of this our life, than either corne or Pulse, or any fruits of the earth whatsoever.

And to begin first at those that are known commodities, and so notorious, as that the vse thereof not only reacheth all our the maine and continent, but extendeth also to the very seas, and one spreadeth them: What say we to Line or Flax, so commonly sowed as it is? yet may it not be ranged either among the fruits of the field, or herbes of the garden. But what region (I pray you) or part of the earth is without it; and what is there so necessary for this life of ours in all respects? Again, is there any thing in the whole world more wonderfull and miraculous, than that there should be an herb found of this vertue and property, as to bring set saile from the straits of Messina in the straits of Sicily, and in seven daies to arrive at Alexandria: Babilus also Gouvernor there likewise, in six; and that by the means of the said herb? Moreover, what say you to Luc Lord Pretour, embarked and tooke ship at Puteoli, and in nine daies sailed to the said Alexandria, and yet he had but a very mild and still wind to helpe him in that voyage? Is not this a strange and soueraigne les pillars, into the harbor of Ostia in Italy? can shew (I say) the kingdome of Catalogne in Spaine before the said port-towne in foure daies, Province in three, and Barbary in two? for C. Flaccus, lieutenant vnder Vibius Crispus the Pro-consull, did as much I speake of, and that with no great forewind, but a most gentle and milde gale. Oh the audacious boldnesse of this world, so rash, so full of sin and wickednesse, that a man should sow and cherish any such thing, as might receiue and swallow the Windes, stormes, and tempests; as if the flout and tide alone were not sufficient to carrie so proud a creature! But now are wee growne moreouer to this passe, that sailes bigger than the Shippes themselves, will not serue our turnes. For albeit one might be sufficient to carrie the biggest crosse-yard that can be denised, yet are not wee content with a single maine-saile

B

maime sailet herenpon, unlesse we set up Saile vpon Saile, top and top-gallant: unlesse (I say) we haue for-
sailes and sprit-sailes in the Prow, misnes also hoised up and displaid in the Poupe; besides other trinkets
and more cloath still; and all to set vs more forward vpon our death, and to hasten our end. Finally, is there
ought againe so admirable, as that of so small a graine as is the Line-seed, there should grow that which is
able to carry to and fro in a moment, this round globe of the earth, the same being so slender a stalke as it is,
and not growing high from the ground? considering withall, that twisled it is not entire and whole in the
stem; but before it can be occupied, it must be watered, dried, braked, tow-aved, and with much labor dri-
uen and reduced in the end to be as soft and tender as wooll: and all to do violence to Nature and Mankinde
most audaciouslly euen in the highest degree, in such sort, as a man is not able to proceed so far in execration,
as is due vnto this inuention. The first deuise whercof I haue inuiged against in conuenient place else-
where, and not without desert; as who could not be content, that a man should die vpon the land, but hee
must perish vpon the sea, to feed Haddockes there, without the honour of sepulture. In the booke but next be-
fore this, I gaue warning and aduertised men, That for to enioy corne and other victuals necessarie for this
life, in suffisance and plenty, we should beware of winde and raine: and now behold, man is so wicked and
vngenerous, his wit so inuentione, that he will be sowing, tending, and plucking that with his own hand, that
calls for nothing else at sea but winde; and neuer rests till Browning be come. See moreover, how well this
vnhappy hand of his speeds: for there is not a plant againe commeth vpon sooner, or thrineth faster than this
Flax. And to conclude, that we may know how Nature her self is nothing wel pleasing therewith, and that it
groweth maugre her will, it burnes the field wherein it is sowed, it eateth out the heart of the ground, and
maketh it worse where-euer it comes: this is all the good it doth vpon a land.

CHAP. I.

¶ The maner of sowing Line or Flax: the sundry kindes thereof: the order how to dresse it.
Also of Napkins and other Naperie. Of Flax and Linnen that will not burne in
the fire. And when the Theatres or Shew-places at Rome
were first encourtained.

Line-seed loueth grauelly or sandie grounds passing wel, and commonly is sowed with
one tilth and no more: yet is there nothing maketh more haste to be aboue ground,
or sooner commeth to maturitie. Being sowne in Spring, it is pluckt in Summer. See
how * injurious it is still to the earth euen this way also! Wel, say that the Egypti-
ans in some sort may be excused, for sowing it as they doe, and making saile-cloath thereof; in
regard of the necessarie traffique they haue into Arabia and India, for to fetch in the commodi-
ties of those countries, what need or reason, I pray you, hath France so to do? Can the Gauls
be sorted in the same range with the Egyptians? Whether would they go? Is it not sufficient
that they see the mightie mountaines standing iust between them and the Mediterranean sea?
Will not this serue to keepe them from Nauigation, that on the huge Ocean side they can dis-
couer nothing but the vast Elements of Water and Aire together? Howbeit, for all this re-
straint, the Cadurci, Caletes, Rutene, and Bituriges; the Morini also, who are supposed to be
the farthest people inhabiting our Continent; yea and thoroughout all parts of France they
weave Line and make Sailes thereof. And now adayes also the Flemmings and Hollanders
dwelling beyond the Rhene (I meane those antient Enemies to the State of our Empire) doe
the like*: in so much as the women there cannot deuise to go more rich and costly in their ap-
parell, than to weave fine Linnen. The obseruation whereof putteth me in mind of a thing that
M. Varro doth report of the whole Race and Familie of the Serrani: in which House this Or-
der was precisely kept, That there was not a woman amongst them knowne to weave any Lin-
nen about her, no not so much as in a smocke next her bare skinn. Now in Germanie, the
spinners and weavers of Linnen doe all their worke in throuds, caues, and vaults, buried, as it
were, vnder the ground: so do they also in Italy and that part of Lombardie that lieth between
the Po and Ticinus, to wit, in the * Countrey Aliana; where (after the Scetabines in Castile,
which is the best) there is very fine workmanship of Linnen cloath, and may deserve the third
place for goodnesse thoroughout all Europe. For the Retovines, bordering hard vpon the
foresaid Alianes, and the Faventines, who inhabit the broad port-way Emilia, are to be ran-
ged

* For that so
quickly it
robbereth her
of moisture.

* It seems that
fine Holland
cloth & Cam-
bricke was in
request by Eli-
zabeths time.

* Regione Alia-
na. Turach.

Aged in a second degree and next to the Scetabines for the fine Linnen which they make. And in
very truth, this Fauentine cloth is alwaies far whiter than the Allian, which is ordinarily brown
when it is new wouen, and before it be bleached. Like as the Retovine is exceeding fine & thick
wouen withall, and besides, not inferior in whitenesse to the Fauentine, howbeit, no nap or down
it carrieth, a thing which as there be some who dogreatly praise and like, so there be others againe
discommend and dislike as much. As touching the thred it selfe that they make of their Flax, it
is more euen (if euener may be) than that which the Spider spinneth, so neruous also and strong
withall, that if a man list to make triall thereof with his teeth, it will giue a twang and ring a-
gain like a Lute-string: and therefore it carrieth a double price to other. As touching the Spa-
nish Flax, and namely, that which Aragon and Cartalogna doth yeeld, it is passing faire and
white, by reason of a certain brook or running water passing vnder Tarracon, wherein it is water-
ed: the nature whereof is to giue it a singular brightnesse aboue the rest. Wonderous fine it is,
and runneth into a dainty small thred: for there first was deuised the fine Cypres or Lawne, and
the curtains thereof. It is not long ago, since out of the same parts of high Spaine, there was
brought into Italy the flax of Zoela, most commodious & meet for hunters to make great nets
and toile. A maritime city this Zoela is, in Gallitia, scituat neere the ocean. There is excellent
good Line also to be found at Cumes in Campaine within Italy, which serueth very well for
snares and small nets to take fishes, and to catch birds with. The same also yeeldeth matter and
stufte for the great cord-nets abouesaid: for wore wel this, that Flax fitteth our turns, as well to
snare and intrap all other beasts, as it doth to indanger our own selues, [vpon the sea.] But of all
others, the toile made of Cumes flaxen cords, are so strong, that the wild bore falling into it, will
be caught: and no maruell, for these kind of nets will checke the very edge of a sword or such
like weapon. I my selfe haue scene so fine and small a thred, that a whole net knit thereof, toge-
ther with the cords and strings called Courants, running along the edges to draw it in and let it
out, would passe all through the ring of a mans finger. I haue known one man also carry so many
of them (easily) as would go about & compasse a whole forest. But this is not the greatest won-
der of them, for more than so, euery one of these threds that went to the making of the masses,
was twisled 150 double: and euen of late daies, *Iulius Lupus*, who died Lord Deputy or Gover-
nor of Egypt, had such. This may well seem a maruell incredible to those who neither knew nor
saw the net-worke Habergeon, or Curer of *Amasis*, a king sometime of Egypt, which was shewed
of late daies within the temple of *Minerva*, in the Isle of the Rhodians; euery thred whereof
carried a twist * 365 double. Certes, *Mutianus* a man of good credit (as who had bin thrice con-
full of Rome) hath related so much at Rome vpon his owne knowledge: for whereas there remai-
ned yet certaine small reliques and little peeces therof, it was his hap of late to meet with some
of them and by his owne triall to find that true, which hac bin reported by others. And verily,
great pittie it is, that such an excellent, rich, and rare peece of work (as it was) should thus come
to nothing, by mens iniurious handling of it, raveling out the threds as they haue don, for to see
the prooffe of the thing.

But to returne againe to our flax of Italy. That which groweth in the Pelignians countrey is
at this day in great account and request: howbeit, none vse it but the Fullers. There is not a
whiter flax to be found, & indeed resembling wool nearer than this flax. Like as, for quilts, ticks
and mattraffes, the flax of the Cadurei in France had no fellow: for surely the inuention therof,
as also of floss to stuffe them with, came out of France. As for vs here in Italy, euen as our maner
was in old time to lie and sleep vpon straw-beds & chaffy couches, so at this day wee vse to call
our pailers still by the name of Stramenta. The Line or flax of Egypt is nothing strong, howbe-
it the people there do raise exceeding great gaine and profit thereof. And foure distinct kindes
thereof are knowne, according to the names of the sundry countries where they grow, to wit,
Tanicum, Pelusiacum, Buticum, and Tentyriticum.

Moreover, in the higher parts of Egypt which bend toward Arabia, there groweth a certaine
shrub or bush carrying cotton, which some call Gossypium, others * Xylon, and the linnen ther-
of made they therefore call * Xylina. This plant is but small, and bringeth forth a fruit resem-
bling the bearded nut or filberd; out of the inner shell or huske whereof [called * Bombyx] there
breaks forth a cotton like vnto downe, so easie to be spun: and there is no flax in the world com-
parable to it for whitenesse & softnesse. Of this cotton, the Egyptian priests were wont to wear
their fine surpleesses, and they tooke a singular delight therein. A fourth kind of linnen there is,
called

* According to
the daies of
the yere.

* Cotton or
Bombace.
* Linly, wol-
sey, or our Fu-
sians rather.
* Hercupon
cotton is cal-
led Bombac

called Orchomenium; it cometh from a certaine fennie reed growing in marishes, I meane the G
tender muchets or charts thereof.

In Asia they haue a certaine kind of broome, the stalke and branches whereof they water and
leafe in steepe ten daies together, and thereof make thread, passing good for to be twitted and
knit into fisher nets, for they will abide the water very well, and indure without rotting. The
Ethiopians and Indians both, find a stufte in manner of Line or cotton in some apples or such
like fruit: and the Arabians meet with the like in gourds, growing as I haue before said vpon
trees.

To come againe to our countrey Line or Flax within Italy, we go by two signes, and know
thereby when it is ripe and ready to be gathered; to wit, either by the swelling of the seed, or the
colour of the plant it selfe, leafe and stalk inclining to yellow. Then is it plucked vp and bound
into certaine bunches as much as handfuls: which done, they are hung vp to drie in the sun one
day, with their heels or roots vpward: the morrow after, they be turned quite contrary, and so
for five daies after, they hang with the foresaid roots downward, that the seed may fall downe
from their heads into the mids of euery bunch or bundle aforesaid; for the seed therof is medi-
cinable, and of effectuall operation in Physicke: yea and the rurall Peasants in Lombardie and
Piemont beyond the Po, vse to make therof a good country meat of a most sweet and pleasant
raist; but now for this good while, that kind of meat or bread is made onely for to be employed
in their sacrifices to the gods. Then after wheat harvest, the stems or stalks thereof are laied
in somewater that is warme with the Suns heat, charged with stones or other weights thereupon,
that they may be borne downe and sinke to the bottom: for there is not a thing besides lighter
than Line, or loueth better to swim. When they be sufficiently watered (which you shall know
by the skin or rind thereof if it be loose and ready to depart from the rowy substance of the stem)
then must the foresaid iauils or stalks bee hung out a second time to be dried in the sun, with
their heads and heels one while vp and another while downe, as before. After they be wel dried,
they are to be beaten and punned in a great stone mortar, or vpon a stone floore, with an hurden
mallet or tow-beetle made for the purpose. Now that part thereof which is vtmost & next to the
pill or rind, is called Tow or Hurd, and it is the worst of the Line or Flax, good for little or no-
thing but to make lampe-match or candle-wick; and yet the same must be better kembed with
hetchell teeth of yron, vntill it be clefted from all the grosse barke and rind among. As for the
good Flax indeed, which is the teere or marrow as it were within of the Line, there be diuers and
sundry sorts and degrees of it, distinct according either to the whitenesse or softnesse thereof.
And the spinning of this fine Flax (I may tell you) is so cleane a worke, that it will become a
man ywis to lay his fingers to it. But what shall be done with all the hard refuse, the long buns,
the stalks, the short shuds or shiues that are either driuen from the rest in the knocking, or par-
ted in the hetchelling; many they will serue very well to heat ouens and furnaces, or to maine-
taine fire vnder kills and leads. And here there is a prettie cunning and skill in the hetchelling
and dispensing of Flax to the prooffe: for if the Line bee good and well ordered, euerie fiftie
pounds of it in bunches or bundles aforesaid, must yeeld fiftene ordinarily of tried and carded
Flax. Moreover, when it is spunne into thread, it must be polished againe and whitened in wa-
ter, with much punning and knocking vpon a stone together with the water. And yet there is
no end, for after it is woven to cloath, it ought to bee followed and beaten a third time with
good clubbe-headed cudgels: in such sort, as the more iniurie that is done vnto it, the better
it is.

Furthermore, there is a kind of Line found out which will not consume in the fire: this in I-
taly they call Quick-line, and I my self haue seen table-clothes, towels, & napkins thereof, which
being taken foule from the board at a great feast, haue been cast into the fire, and there they burne
before our face vpon the hearth, by which meanes they became better scoured, and looked
fairer and brighter a hundred times, than if they had bin rinsed and washed in water; and yet no
part of their substance, but the filth only, was burnt away. At the roiall obsequies and funeralles
of KK the manner was to wind and lap the corps within a sheet of this cloth, of purpose to sepa-
rate the cinders comming of the body, from other ashes [of the sweet wood that was burnt
therewith.] This manner of Line groweth in the deserts of India, where no rain falls, where the
countrey is all parched and burnt with the Sunne, amongst the fell dragons and hideous Ser-
pents: thus it is insured there to line burning, which is the reason, that euer after it wil abide the
fire.

A fire. Geason it is to be found, and as hard to be wouen, so short and small it is. How soeuer other-
wise it be naturally of colour reddish, yet by the fire it getteth a shining glosse and bright hew.
They that can come by it and meet withall, esteeme it as precious as the best orient pearles. In
Greece they call this Line, Asbestinum, according to the nature and propertie that it hath, not
to consume with burning.ouer and besides, *Anaxilaus* saith, That if a man would cut downe or
fall a tree by stealth and in secret, let him compass the body thereof with a sheet of this lin-
nen, he may hew as long as he will at it, and all the strokes that he giueth will be so drowned, that
they shall not be heard againe. To conclude, in all these respects aboue said, this Line may well
be counted for the principall and best that is in the whole world.

The next to it in goodnesse, is the Line called Byffus: the fine Lawn or Tiffany whereof out
wines and daries at home set so much store by for to trim and deck themselves: it groweth in
Achaia within the territorie about Elis: and I find, that in old time it was sold as deare as gold,
for a * scruple thereof was commonly exchanged for * foure deniers Roman.

The lint or nappie downe which linnen cloth beareth in manner of a soft cotton, especially
such as cometh of ship failles that haue lien at sea, is of great vse in Physicke. * The ashes also
made thereof, be counted a good Succedane of Spodium, and for their efficacie may go for it.
Moreover, there is a kind of Poppies much sought after for blanching and bleaching of linnen
clothes; for being skoured therewith, it is wonderfull how white and pure they will look: & yet
for all the beautie that consisteth in that colour, people are grown to this disorder & vain enor-
mity, that they haue assaid to stain and die their linnen and naperie into other colours, as well

C as their woollen cloth. Which practise was first seen in the Armada or fleet of K. *Alexander*
the Great, vpon the great riuer Indus, at what time as his captaines and Admiralls in a certaine
skirmish that they madewith the Indians, changed the armes and ensignes of their ships: where-
at the inhabitants (being vpon the shore and strond) were astonished to see their failles and stre-
mers painted with diuers colours wauiug in the wind. Semblably, the failles of that ship were
died purple, wherein *M. Antonius* together with *Cleopatra* came to Agium, and in which they
fled both from thence and escaped. And indeed heretofore a red purple banner erected on the
top of the mast, was the badge or ensigne of the royall Admirall ship: but afterwards they be-
gan at Rome to incourtaine their Theatre with such vailes dyed in colours, onely for shade: an
inuentiun deuised by *Q. Catulus* at what time as he dedicated the temple of the Capitoll. In

D proceffe of time, *Lentulus Spinther* (by report) was the first man that in the solemnity of the games
and plaies Appollinate, drew fine curtaines ouer the great Amphitheatre at Rome: howbeit
not long after, *Cesar* Dictator caused the grand Forum or Common place at Rome to be coue-
red all ouer with such rich Courtains, yea and the high faire street called Sacra, to bee hanged
on both sides from his owne dwelling house to the very Capitoll cliffe: which magnificent and
sumptuous sight, was more wondered at and scene with greater admiration, than the braue shew
and Tourney that he fet out at the same time of Sword-plaies at sharpe and to the vtterance.
Then followed *Marcellus* also the son of *Octavia*, sister to the Emperour *Augustus*, who in his own
Edileship and in the tenth Consulship of his vncke *Augustus* before said, vpon the Calends or
first day of August that yeare, caused the Romane Forum to be drawne all ouer and shadowed

F with the like courtains, although he represented at that time no solemnitie at all of games and
plaies: and this he did only, that they who came to plead at the barre, might stand vnder shade
more wholefomely. Lord, what a change was here at Rome since the daies of *Cato* the Censor,
who thought it meet and requisite, yea and gaue aduise that the said Forum or great Hal of com-
mon Pleas should be paved and laid all ouer with caltraps vnder foot, To keep our Lawyers and
busie pleaders from thence. Of late daies there were scene in the Amphitheatres of Emperour
Nero, trauerfes drawne vpon cords and ropes, with fine courtains of blew azure colour like the
skie, and those beset with stars; where the very floore of the ground vnder mens feet, was colou-
red red. And wherefore serue these in cloister courts and walks now, but to keepe the mosse for-
sooth vpon the ground, or rather the fine fret-worke in pauements, from sun-burning? But for
all these paintings and rich dyes, yet when all is done, the white linnen held the own still & was
highly esteemed aboue all colors. And no doubt in great price such cloth was in the time of the
Trojan war: and in good faith I see no reason why it should not be as well in bloody battails as
at broken shipwracks: howbeit *Homer* testifies, that few there were who went to the wars with lin-
nen habergeons or cures: but it should seem that the Poet (as the better learned expositors doe

terpret) meant, That ship-tackling, sailes, cords, and ropes, were made of this Line, speaking as G he doth of * Sparta, whereby he vnderstandeth indeed Sata, .i. cordage of sowne Line or garden Flaxe.

CHAP. II.

¶ The nature of Spart or Spanish broome : the manner of handling and dressing it : when it was first used in cordage : what Plants there be that line and grow without root.

Spart verily was not in vse and request for many hundred yeares after, neither was it knowne before the first voiage and expedition that the Carthaginians made in warlike manner into Spaine. An herb this is also, growing of it selfe without setting or sowing (which indeed it cannot abide.) Full well and properly it might be called, the rush of a dry and leane ground, and a very defect or imperfection appropriate to that countrey alone of Spaine : for, to say a truth, it is the fault and badnesse of the soile in the highest degree, that breedeth it, and where it commeth vp, nothing else can be sowed and set, or will grow at all. That in Affricke or Barbary is very small, and good for nothing. In the territory of new Carthage or Cartagena (which is in the higher part of Spaine) it groweth much : lowbeit all that tract is not giuen to breed it, but look where it commeth vp, you shall see whole mountaignes all ouer-spread and couered with it. Hereof the rusticall peasants make their mattraces and beds; this is their fewel wherewith they keep fires, of it they make their torches and links to giue them light; with it they are commonly shod; and the poore shepheards cloath themselves therewith. Howbeit, hurtfull is this plant to cattell, vlesse it be the tender tops and crops of the branches; which they may brouse and eat without harme. For other vses, when the Spaniards would plucke it vp they haue much adoe withall, and a great toile about it; for their legs must be wel booted as it were with grines; their hands couered with thick hedging-gloues, as gantlets; and being thus armed at all points, yet they lie tugging at it, pulling, writhing, and wresting the same with hooks and crooks either of bone or wood, vntill they haue their will of it. Come they about this work in winter time, it is in manner vnpossible to get it vp; but from the Ides [i. the mids] of May vnto mid-Iune, it is very tractable : for this is the time and season when it is ripe, and then commonly they gather it for their ordinary vses before named. Being once pulled and sorted, the good from the bad, it is made vp into bundles and faggots with the life still in it, and so piled on a heap for the first two daies; the third day they vnbind it, lay it loofe and scattering in the Sun for to be dried : which done, they make it vp againe into fagots, and so bring it in and lay it vp within house. After all this, they steep it in sea water (for that is best) or els in fresh, for want of the other. After this watering, it must be dried in the Sun, and then steeped in water a second time : but if a man haue vrgent occasion to vse it presently out of hand, he must put it in a great tub or bathing vessel, & let it soke there in hot water a time. Now if when it is dried againe, it be stiffe and will stand alone, they take it for a sure signe that it is sufficiently watered, and hath that which it should haue. This is a very neere and ready way, & saue them much labour. Thus being prepared one of these two waies, it ought to be brayed and beaten before it will serue the turne; and then no cordage in the world is better than that which is made of it, nor lasteth so well within the water and the sea especially, for it will neuer be done. For drier worke, I confesse, and out of the water, the gables & ropes wrought of hemp are better; but Spart made into cordage will liue & receiue nourishment within the water, drinking now the full as it were to make amends for that thirst which it had in the natue place where it first grew. Of this nature is Spart besides, that if the ropes made thereof be wornt, and (with much occupying) out of repaire, a little thing will mend and refresh them, yea and make them as good as euer they were; for how old soeuer it be, yet will it be wrought very well again with some new among. A wonderfull thing it is to consider and look into the nature of this herb, and namely, how much it is vsed in all countries, what in cables and other ship-tacking, what in ropes for Masons and Carpenters, and in a thousand necessities of this our life. And yet see! the place which furnissheth all this store, lying along the coast of new Carthage, we shal find to be within the compasse of thirty miles in bredth, & lesse somewhat in length. And verily, if it were fetched farther off within the main, the cariage would not quit for the cost and expences.

The

A The Greekes in old time employed their riches in drawing of ropes : as may appeare by the very word *seme*, which signifieth with them a rish, and a rope. But afterwards they vse their cordage of Date tree leaues, & the thin barks of the Linden or Tillet tree; from whence verily, like and probable it is, That the Carthaginians borrowed both their vse of Spartum, and maner also of dressing it.

Theophrastus writeth, That there is a bulbous plant, with a root like an Onion-head growing about the banks of riuers; between the vtmost rind whereof, and that part within, which is good to be eaten, there is a certain cotton or woolly substance, whereof folke vse to make * woollen sockes and some such slight peeces of apparell. But he neither named the countrey where they be made, nor sets downe any other particularities more than this, That the said plant they called *Eriophoron* [i. Bearing wooll :] so far as euer I could find in any copies comming to my hand. And albeit *Theophrastus* was otherwise a diligent and curious writer of plants, and searched deep into the nature of simples, foure hundred and ninety yeres before my time, yet hath he made no mention at all of Spart, a thing that I haue obserued and noted in him once already before now. Whereby euident it is, that the manner of dressing and vsing Spart, came vp after his daies.

And since we are entred into a discourse of the wonders of Nature, I will follow on still and continue the same, wherein this may be one of the greatest, That a thing should liue and grow as a plant without root. Looke but to those Mushrooms or Toad-stooles, which are called in Latin *Tubera*; out of the ground they grow, compassed about on euery side with the earth, with out root, without any filaments, or so much as small strings & beards resembling a root where-vpon they should rest: the place where they breed doth not swel or bear vp one jot, nay, it shews no chink or creuasse at all out of which they should issue; and to conclude, they seem not once to stick and cleaue to the ground whereupon they stand. A certaine barke or pill they seem to haue, which enloseth them, such as (to speake plainely) we cannot say is earth indeed, nor any thing else but a very brawnie skin or callositie of the earth. These breed commonly in drie and sandie grounds, in rough places full of shrubs and bushes, and lightly in none else. Oftentimes they exceed the quantity of good big Quinces, euen such as weigh a pound. Two sorts there be of them. Some be full of sand and grit, and such plague folkes teeth in the eating : others bee clean, and their meat is pure, without any such thing among. They differ also in color, for there be of them that are red-ye shall haue those also that seem blacke, and yet are white within. But the best simply are those that come out of Affricke or Barbarie. To determin resolutely whether they grow still from day to day, as other plants; or whether this imperfection of the earth (for better I know not how to call it) commeth at one instant to that full growth that euer it will haue; also, whether they liue or no, I suppose it is a difficult and hard matter: surely this is certaine, that their putrifaction is much after the manner of wood, and they rot both alike. Many yeres past there are not, since *Lartius Licinius*, sometimes lord Pretor and gouernour vnder the Romans in the prouince of Spain, chanced (of my knowledge) while he was there at Carthage, in biting one of these Mushrooms, to meet with a siluer Roman denier within it, that turned the edge againe of some of his fore teeth, and set them awry. Whereby a man may perceiue manifestly, that they be a certaine excrecence of the very earth, gathering into a round forme, as all other things that grow naturally of themselves, and come neither by setting nor sowing.

CHAP. III.

¶ Of the excrecence named * Misy : and of other such like Puffes and Mushrooms. Of those flat Puffes and broad Toad-stooles, called * *Pezizi*. Of the plant or herbe * *Laserpitium*. Of *Mazdaris*. Of *Atadder*. Of *Sope-weed*, or the Fullers herbe *Radicula*.

* or, Mison.

* or, Peziza.

* Laserwort.

W Itin the prouince of Cyrenaica in Affricke, there is found the like excrecence called *Misy*, passing sweet & pleasant, as well in regard of the smell as the tast, more pul-pous also & fuller of carnositie than the rest; likewise, another of that nature in Thracia, called *Ceraunium*. As touching al the sorts of Mushrooms, Toad-stooles, Puffes, Fusbals or Fussies, these particulars following are obserued, First it is known for certain, that if the autumn be much disposed to rain, and withal, the aire be troubled and disquieted with many thunders, during that season, there will be good store of such Mushrooms, &c. especially, (I say) if it thun-der

* or Mison, rather, according to *Turneb.*

der much. Secondly, they will not last about one yere. *Item*, The tenderest & daintiest be those that breed in the Spring, and that indeed is the best time for them. *Item*, In some countries the overflow of rivers engender Mushromes, and namely, at Mitylene, where (by report) they will not otherwise grow but upon floden grounds, and namely, in such places whither the water hath brought from Tiara, a certain vegetative seed to breed them. And verily, That Tiara is wonderfully stored & replenished with such. As touching the Truffles or Mushrooms of Asia, the most excellent of all others be neer unto Lampfacum and Alopecurus: but the best that Greece yeeldeth are in the territorie about the citie Elis. In this Toad-stoole or Mushrome kind are those flat Puffes and Puffes to be reckoned, which the Greekes name *Peziza: as they haue no root at all, so they be altogether without either stele or taile.

or Pezizi

* Some take it for Benion, or Asa dulcis.
* Which is equiuolent in weight to a dram, i. 7. doob English.

* Thought to be Asa fetida.

* 500 miles.

In the next place to these I must needs speake of the most noble and famous plant Laserpitium, which the Greeks name Silphium, discovered and found first in the abovesaid province of Barbarie Cyrenaica. The juice or liquor drawne out of this hearb they cal *Laser, a drug so magnified, of such singulartie and vse in Physicke especially, that it was sold by weight, and a dram thereof cost commonly *Romane denier. For these many yeares of late, there is none of this plant to be found in that country of Cyrenaica before said: for that the Publicans and Farmers of the pastures and grounds there, (vnder the people of Rome) doe put in their cattell among these plants, and eat al downe by that means: finding thereby a greater gaine or commodity, than by letting them stand for the juice or liquor aforesaid. One only stalk or stem thereof hath bin found in our days, which was sent vnto Emperor Nero as a present, for a great nouelty. If it chance at any time, that either sheepe or goat (which commonly bite neer to the ground) do light vpon a yong plant thereof, newly peeping forth and not euident to be seene, you shall know it by these signes, The sheepe presently so soone as she hath tasted it will drop asleep, and the goat fall a neesing. For these many yeres the merchants haue brought vs into Italy no other *Laser, than that which grows abundantly in Persis or Media, and in Armenia: but it is far inferior to this of Cyrenaica, and commeth short of it for goodnes. And this that we haue is no better than it should be, for they sophisticate and corrupt it with gum, with Sagapeum, or else with bruised Beans. In regard of which scarcity, I cannot chuse but remember that which befell at Rome in that yere wherin C. Valerius and M. Herennius were consuls, when by great good fortune there was brought from Cyrenæ thirtie pound weight of the best Laser, and set abroad to be seene in open place, of all commers. As also I may not let passe another occurrent, namely, how Caesar Dictator at the beginning of the ciuile war, tooke forth openly out of the chamber of the citie, with other treasure both of gold and siluer, an hundred and eleuen pounds of the best Laser. Moreover, this one thing more I cannot forget: the best and most renowned Greeke Authors haue left in writing, That 7 years before the foundation of the citie Cyrenæ, which was built 143 yeres after our citie of Rome, this plant Laserpitium that beareth the said Laser was engendered at one instant, by occasion of a certain thicke, grosse, and black shewer of raine, in manner of pitch, which sodainely fell and drenched the ground, about the horthyards or gardens of the Hesperides, & the greater Syrtis: The which rain was effectual, and left the strength thereof, for the compass of * foure thousand stadia within Affricke or Barbarie. They affirme moreover, That the herb Laserpitium, there growing, is of so sauage and churlish a nature, that it cannot abide any culture or good ordering by mans hand: but if one should goe about to tend and cherish it, it would rather chuse to be gon into the desert and vnpeopled parts of the countrey, or else winder away and die. Moreover, they set downe this description of it, That it hath many roots, and those bigge and thicke, a stemme or stalke, resembling the hearb Sagapeum or Fennell-giant, howbeit, not altogether so great: the leaues of this plant, which they termed by the name of Maspetum, come very near in all respects to those of Smallach or Persely. As touching the feed that it beareth, flat and thin it is in manner of leaues: but the leafe it selfe therof, sheddeth in the Spring time. The cattell that vse to feed thereupon (and whereof they be very greedy) first fall a scouring: but afterwards, when they be clenfed and rid of ill humors, begin to wax fat: and their flesh by this means becommeth wonderfull sweet and pleasant. They report moreover, that after the leaues be fallen, men also were wont in old time to eat the stem or stalk thereof, either roasted and baked vnder the cindres, or else boiled and sodden in water: and their bodies likewise for the first 40 daies ensuing, did nothing but purge til they were cleared of all diseases, breeding by occasion of any Cacochymie or collection of ill humours within them.

Now

A Now concerning the juice or soueraigne liquor before said, the manner was to draw it after two sorts; to wit, by scarification, either out of the root, or forth of the stem and maister stalke. And hereof it came to haue two names, Rhizias and Caulias. But the later of these two, to wit, that which came of the stem, was counted the worst, subiect to putrification, and sold cheaper than the other. To come now to the root of Laserpitium, it hath a blacke rind or barke vpon it, wherewith the merchants vse to sophisticate many of their drugs. As for the manner of dressing and ordering the juice thereof, it was no sooner drawne, but they put it into certaine vessels, together with brans among, then euer and anon they plied it with stirring and shogging, vntil it had lost the cruditie and verdure thereof, and by that working, came to the maturity and perfection: for if it were not thus well followed, soon would it catch a vine, begin to putrifie, and so continue but a while. In this worke of theirs they had an eye vnto the color how it changed: for when they perceived it to be high, & that they saw it once drie and haue don sweating & breathing out the raw humidity and vapor within, then they knew thereby that it was wrought sufficiently, and come to the full ripenesse. Others there be who say, that the root of Laserpitium beareth more than a cubit in bignesse, and that out of it there swelleth an excrecence, about the ground, out of which there was wont by way of incision to issue forth a certaine white juice in manner of milke: vpon which grew the stalke or stem which they called Magydaris. And they affirme besides, that it beareth leafy flat graines for the seed, in color like gold, which shed presently vpon the rising of the Dog-star, especially if the wind be south. Of which grains or seeds fallen to the ground, yong plants of Laserpitium vse to grow vp vnderneath, that within the compass of one yere wil thriue both in root and stem to the iust and full perfection: they haue written moreover, that the vse was to dig about their roots, and to lay them bare at certain times of the yere. Also, that they serued not to purge cattell as is aforesaid, but to cure them if they were diseased: for vpon the eating thereof either they mended presently, or else ended and died out of hand; but few they were that miscaried in this sort. As touching the former opinion of purging and scouring, true it is, that it agreeth well to the other Silphium or Laserpitium of Persia, aforesaid. Another kind there is of it named Magydaris, more tender and lesse forcible and strong in operation than the former; and affoordeth no such juice or liquor at all, it grows about Syria, and commeth not vp in all the region about Cyrenæ.

Moreover, vpon the mount Parnassus there is great plentie found of a certaine hearbe, which D the inhabitants would needs haue to be Laserpitium, and so they cal it: wherewith indeed they are wont to abuse and sophisticate that singular and diuine plant, the true Laserpitium, so highly commended, and of so great account and regard. The principall and best triall of the true and sincere Laser, is taken from the colour, somewhat enclining to rednesse without: breake it, you shall haue it appeare white within: and anon transparent. If you drop water vpon it, or otherwise thin spittle, it will resolute and melt. Much vse there is of it in many medicines, for to cure mens maladies.

Two plants more there be well knowne to the common sort and base multitude, and to say a truth, few e are acquainted with them, notwithstanding they be commodities of much gaine, and many a peny is gotten thereby. The first is Madder, in great request among diers and curriers: and for to set a color vpon their wooll and leather, right necessarie. The best of all and most commended is our Madder of Italie, principally that which groweth about villages neere vnto our citie of Rome. And yet, there is no country or province lightly but is full of it. It commeth vp of the owne accord, and is sowed besides of seed, and set of slips in manner of Erule. Howbeit, a prickie stalke it hath of the owne: the same is also full of joints and knots, and commonly about euery one of them it hath five leaues growing round in a circle. The feed is red. What medicinable vertues it hath, and to what purpose it serueth in Physicke, I will declare in place convenient.

The second is that which is called in Latin Radicula, [i. Sope-wort] an hearb, the juice wherof Fullers vse so much to scoure their wooll withall: and wonderfull it is to see how white, how pure, how neat and soft it will make it. Being set, it will come vp and grow in any place: but of it selfe without mans hand, it groweth most in Asia and Syria, among rough, craggie, and stony grounds. The best is that which is found beuond the riuer Euphrates, and that bears a stem like tall Fennell, howbeit small and slender, and whereof the inhabitants of the countrey there doe make a delicate dish; for besides, that it hath a commendable tast and much desired, it giueth a pleasant

pleasant colour to what meat soever is sodden in the pot with it. It beareth a leafe like the Olive: the Greeks call it Strution: it flourisheth in Summer: lovely it is to the eye, but no smell at all it hath to content the nose: prickie moreouer it is like a thorne, and the stalk notwithstanding couered with a soft down: seed hath it none, but a big root, which they vse to cut, shred, & mince small for the purposes aforesaid.

CHAP. IV.

¶ The manner of trimming and ordering Gardens: the sorting of all those things that grow out of the Earth, into their due places, besides corne and plants bearing fruit.

IT remaineth now to treat of Gardens, and the carefull diligence thereto belonging: a commendable thing in it selfe, and recommended vnto vs besides by our fore-fathers and auncient writers, who had nothing (to speake of) in more account and admiration in old time, than the gardens of the Hesperides, of *Adonis*, and *Alcionis*: as also those pendant gardens vpon terraces and leads of houses, whether they were those that *Semyramis* Queene of Babylon, or *Cyrus* K. of Assyria, deuised and caused to be made. Of which, and of their workmanship, my intent is to make a discourse in some other booke. Now for this present (to goe no farther than Rome) the Romane KK. verily themselves made great store of gardens, and set their minds vpon them: for so we read, that *Tarquin* surnamed the Proud (the last king of Rome, was in his garden when he gaue dispatch vnto that messenger that was sent from his sonne about a cruell and bloudie errand, for to know his fathers aduise and pleasure as touching the citizens of Gabij. In all the twelve tables throughout which contain our ancient lawes of Rome, there is no mention made so much as once of a Grange or Farm-house, but euermore a garden is taken in that signification, and vnder the name of Hortus [i. a Garden] is comprised Haredium, that is to say, an Heritage or Domain: and herupon grew by consequence, a certain religious or ridiculous superstition, rather of some whom we ceremoniously to sacre and blesse their garden and hortyard dores only, for to preserve them against the witchcraft, and forcerie of spitefull and enuious persons. And therefore they vse to set vp in gardens, ridiculous and foolish images of Satyres, Antiques and * such like, as good keepers and remedies against enuy and witchcraft, howsoever *Plantus* assigneth the custodie of gardens to the protection of the goddesse *Venus*. And euen in these our daies, vnder the name of Gardens and Hortyards, there goe many daintie places of pleasure within the very citie, vnder the color also and title of them, men are possessed of faire closes and pleasant fields, yea and of proper houses with a good circuit of ground lying to them, like pretie farmes and graunges in the countrey: all which, they tearme by the name of Gardens. The inuention to haue gardens within a citie, came vp first by *Epicurus* the doctour and master of all voluptuous idleness, who deuised such gardens of pleasure in Athens: for before his time, the manner was not in any citie, to dwell (as it were) in the countrey, and so to make citie and countrey al one, but all their gardens were in the villages without. Certes at Rome, a good garden and no more, was thought a poore mans cheinance; it went (I say) for land and liuing. The Garden was the poore commoners shambles, it was all the market place he had for to prouide himself of victualls. O what a blessed, what a secure, and harmlesse life was that, so long as men could be content to take vp with such a pittance, and stay themselves so! but better it is I trow, for to satisfie the appetit of our wanton gluttons and belli gods, to search into the bottom of the deepe sea: for to get (I say) oysters of all sorts, to feare no tempest nor shipwrack: for to meet with daintie fowle, to send out one way as far as beyond the riuer *Phasis* for those birds, which a man would thinke were sure ynough and secured from the fouler, by reason of the fearful tales that goe of them, and of the daunger of those that approach neere vnto them (and yet why say I so, considering they are the better esteemed and more precious the farther they be set and dearer bought): to haue purueys another way in *Numidia* and *Ethiopia*, for the rare birds there about the sepulchres, among those sepulchres (I say) where in stead of meeting with game, they stumble otherwhiles vpon their owne graues and neuer come home again: and lastly, to haue others to chase the wild and sauage beasts of the Forrests, yea and to maintain fight with them, in daunger to be deuoured as a prey, by those which for their must serue as venison for other men to eat. But to come againe to these commoditie Gardens, and the cates which

* as *Priapus*,
Phallus, and
Ithyphallus.

A which they affoord: how cheape be they? how ready at hand? how fitted are they not only to fill the belly and fatisfie hunger, but also to please the tooth and content the appetite, were it not that wealth and fulnesse stand in the way: the same that loath all things els beside, and disdain (no maruell) these ordinarie viands. Wel might it be borne with and suffered, that Apples and other fruits of the trees, such as are more exquisite and singular than the rest, in regard of their beauty, bignesse, pleasant sauour, or strange and monstrous manner of growing, euen against the course of Nature; that these dainties (I say) should be reserued for our rich and mighty men of the world; that poore men should be debarred and forbidden once to taste thereof. In some sort tolerable also it is, that great States and wealthy personages should be serued at their table with old wines, fined and refined, with Wines delaied, neatified, and goulded, as it were, by passing thorow an *Ipocras* bag; that such should drink no other but that which was wine before they were born, how aged soeuer they be and far stept in yeares. We may abide moreouer, that our grand-panches and riotous persons haue deuised for themselves a delicat kind of meat out of corn and grain (which should serue for bread only) and the same made of the finest and purest flour, bolted and searled from the rest, and none but that: to say nothing of the curious work in pastrie, the fine cakes, wafers, and marchpanes, artificially carued, ingraued, and painted in imagerie, as if these wantons could not liue, forsooth, but of such deuises. That there should be a difference also in bread, answerable to the distinction of States in the city, one sort for noble Senators, another for the worshipfull knights and gentlemen, and a third for the mean commoners and multitude. Finally, that in other victuals there should be a descent by so many degrees, from the highest to the lowest, many cary some apparence of reason, & be allowed. How then? must there be a distinction therefore inuented in worts and garden pot-herbs? Must the difference of persons according to their purse appeare also in a dish of * three farthings price, and no better? Surely I see no sense nor congruitie at all in this. And yet forsooth such herbes there be, that the tribes of Rome (the greater part I mean of the Roman citizens) may not presume to eat; as if the earth had brought them forth for rich men onely, being no meat ywis for poore people. Why (say they in scorn and contempt of pouertie) here is the stem of a Wort so well growne, here is a cabbage so thriuen and fed, that a poore mans boord will not hold it. Certes dame Nature ordained at the first, That Sperage should grow wilde and commonly in all places of the field, as if she meant thereby, that euery man that would might gather them for to eat: and now behold they are cherished carefully in gardens; and from *Rauenna* you shall haue of these garden Sperages so fair and big, as three of their crops or heads wil weigh a good pound, and are sold after three a Roman As. O the monstrous bellies that be now adaies! O the excessive gluttonie and gourmandise which now reigneth in the world! Is it any maruell, that poore Asles and such dum beasts may not feed vpon * Thistles, when the Commons of Rome are restrained and forbidden to eat * Thistles, and dare not once touch them? And yet here is not all: our waters also be distinguished and set apart for some persons; euen the very elements whereof this world consisteth, are distinct, seuered, and raunged into sundry degrees, and all at the pleasure of monied men: for some you shall haue to drinke snow, others ice: and will you see in one word their folly and vanity? the very miserie that high mountains are punished and

* *Estimatio*

* *Arischoket*,
which are no
better than
Cardus altilis,
i. Garden-
Thistles.

But now it is time to returne againe vnto our gardenning, from which we were digressed. Certaine

rain it is, that in old time there was no market place at Rome yeelded greater impositiō vnto the State than the Herberie, in such request and so much called for were worts and pot-herbs. In regard of which exactions and payments, euermore going out of their purses, the Commons in the end complained, laid open their griefes, and made their mone to the Senate, of this burden and heavy load; and neuer gaue they ouer crying still vnto them with open mouth, for redresse, til they obtained a full releafe of rent and custome, raised before from the tallage and portage of this kind of ware and commoditie. Whereby it was well knowne and found by long experience, that there was no one thing of greater reuenue and more assured gain; none that stood so safe and certaine; none lesse subiect to the will and pleasure of Fortune & Casualtie, than gardenage: as being taken for no lesse than a yerely fee, that poore men might make account of as sure as if it were in their purse. Again, for the rent thereof paid to the land-lord, there was euer good securitie: the ground or soile was a sufficient surety; the profits thereof were alwaies seen and expofed openly to the eye; and lightly no weather whatsoeuer hindred the crop & gathering thereof. *Cato* highly commends the garden Coules or cabbages, whereby we may know, that in his daies gardens were in some respect. Also in times past, as husbandmen in the country were known especially, & their wealth valued by their gardens, so when there was a garden plot seen lying out of order, and not well kept, men iudged straitway, that the mistresse or dame there dwelling (for commonly this charge lay vpon women) was but an ill huswife, and thriflesse in her house: for in default of gardenage what remedy was there then, but to draw the purse strings, and go for euery thing either to the Butchery or the herbe-market, and so to liue vpon the penny. Neither were in those daies Coules or cabbages so well esteemed as now they be: for why, they could not away with double meats one vpon another, but condemned all dishes that required some addition, as help of sauce, broth, or such like to draw them downe. This was to spare cost, and by this means they saued oile. For as touching the pickle sauce * *Garum*, all those were reproched for gourmandise and gluttony, who could not eat fish or flesh without it. And therefore men tooke greatest contentment in their gardens & garden herbs: those were at hand and ready at all times, no great cookerie was required to dresse such dishes, no need of fire, no expence of wood and fewel. And hereupon it came, that salads of herbs were called * *Acedaria*, so little care and trouble went to the prouision and making of them. Beside, light they are of digestion, they breed no heauinesse in the head, they offend not the braine nor any of the senses; and least of any thing make quarrell to the loafe and spend little bread. That quarter of the garden which serueth an house with poignant herbs in stead of sauce, to giue a commendable tast and seasoning to our meat, sheweth plainly, that the master and mistresse thereof were not wont to run in the merchants books for spicerie, but changed the Grossier or Apothecaries shop for the garden; for the same contentment they had out of it, as from thence: also that they sought not either for pepper out of India, or for any kitchen spices transported from beyond the seas out of far countries. And as for the other quarters, set out with beds of floures, & sweet smelling hearbes, what reckoning was made of them in old time may appeare by this, That a man could not heretofore come by a Commoners house within the city, but he should see the windowes beautified with green quishins, wrought and tapissed with floures of all colours, resembling daily to their view the gardens indeed which were in out villages: insomuch, as being in the very heart of the city, they might think themselves in the country; till such time as these fly theues and night-hookers, the wicked rabble (I say) and off-scouring of the base multitude (not to be reckoned) committed such felonious outrages, as forced men to naile vp couers and cafes before these faire lights and beautifull prospects. Let vs giue therefore to gardens their due honour: let vs not (I say) depriue things of their credit and authoritie, because they are common and nothing costly: for I may tell you, some of our nobilitie, yea the best of the city, haue not disclained to take their sir-names from thence, nay they supposed themselves highly credited and honored thereby. Thus we see, that in the Noble house and lineage of the *Valerij*, some were not abashed nor ashamed to be called *Laetucini*, in regard of the best kind of Lettuce that they either had in their gardens, or affected most. And here I cannot chuse but mention by the way, the grace that hath growne to our name, by occasion of some diligence imploied and paines taken this way; whereby certaine Cherries beare our Name, and are called *Pliniana*, in testimonie of our affection and loue to that fruit. Which I remember the rather, for that *Virgil* confesseth how hard a thing it is, that so small matters as these be should grow

* Much like
to our An-
choues.

* *aliū ē garū.*

- A grow into the name and reputation of honor any way. And now to the purpose. No man doubteth, but that a garden should lie to a graunge or ferme-house, and ioine close vnto it: as also, that about all things there should be water at commaund, from some riuer or brooke running vnder, yea, and through it, if it were possible: if not so, yet that they are to be watered with pit water fed with Spring, either drawne vp by plaine poles, hookes, and buckets; or forced by pumpes and such like, going with the strength of wind within enclosed, or else weighed with Swipes and Cranes. Moreover, that a garden-plot should be broken vp and haue the first digging presently vpon the coming of the west wind *Fauonius* in the beginning of the Spring; and for any thing that must be set or sown there, against Autumne, it ought to be prepared and dressed readie for to receiue seeds and sets, 14 daies after: but for Winter stuffe, it should haue
- B a stirring or second tilth and deluing before the Winter Sunstead or shortest day of the yeare. Also, this is to be noted, that there would not be a greater plot of ground taken in, empaled and fenced about for a garden, than of 8 acres or Iugera at the most. Now for the manuring and ordering thereof: first, for three foot deep the dung would be tempered and mingled with the mould. *Item*, It ought to be diuided in principal quarters: the same also must be set out into seuerall beds, raised somewhat high and lying vpward. *Item*, Requisit it is, that euery quarter haue as welcetraine open gutters or furrowes drawne about them, as conuenient allies betweene to giue both passage for men to come and goe gainely; and also a currant to the course of water that shall be let in, when the springs be set open or fluces drawne.
- Garden plants and hearbs be not all commendable in one and the same respect. For of some
- C the goodnesse lieth only in their bulbous and round root: of others contrariwise in their head aloft. There be of them that haue no part good but their stem or maiest stalk: and there are for them againe, the leaues wherof be only eaten. Now a man shall haue amongst them those that are wholesome meat, both leafe and stalke. In some the seed or graine, in other the outward pill or rind alone of the root is in request. And as there be that tast well in the skin or cartilage and gristly substance without forth, so there are that haue either their pulposus carnosity within, or else their fleshy coat about, as daintie. All the goodnes of many of them lieth hidden within the earth: and of as many againe about the ground, and yet some there be that are al one, as good within as without. Some traine along and run by the ground, growing on end fill as they creep, as Gourds and Cucumbers. And yet the same, as well as they loue to be neere the earth, yet are
- D led Ipon trailes, and hang thereon, yea, and be knowne for to rampe vpon trees: Howbeit, much weightier and better nourished be they that keepe beneath. As for the Cucumber, it is the cartilage substance of the fruit thereof, that delighteth and pleaseth our tast: for of all fruits this proprietie it alone hath, that the vtmost rind which it beareth, groweth to a very wood when it is once ripe. Within the earth lie hidden and are kept all Winter, Raddishes, Nauews, Turneps or Rapes, Elecampane also after another sort; so doe Skirworts, and Parleneps or Wypes.
- Moreover, this I would aduertise the Reader, that when I tearme some hearbes Ferulacea, I meane such as resemble in stalke Dil or the great Mallowes. For some writers doe report, That in Arabia there be a kind of Mallowes which after they haue grown six or seuen months, come to be in the nature of pretie trees: insomuch, as their stalks streightwaies serue in stead of walking staues. But what should I stand vpon this? In Mauritania, by report of trauellers, neer the frith or arme of the sea adjoining to Lixos, the head citie of Fez, where sometimes (as folke say) were the hort-yards and gardens of the Hesperides, not about halfe a quarter of a mile from the maine ocean, hard vnto the chappell of *Hercules* (farre more ancient than that temple of his, which is in the Island Calis) there groweth a Mallow, that is a very tree indeed in height it is twentie foot, and in bodie bigger and thicker than any man can fadome. In this kind I meane for to range the Hempe likewise. And as I purpose to tearme such Ferulacea; so there be some others, that I will call Carnosa, such as resemble the riuer or fresh-water Spunges, which commonly are seene vpon ouer-floden meadows, where the water standeth. For as touching the fungous substance or callioitie of some plants, I haue already spoken thereof in the Treatise of Wood and Trees, and of their nature: Likewise in our late discourse of another sort of Mushrooms and Toad-stooles.

C

CHAP.

OF the cartilage and pulposus kind (such I meane onely, wherof there is nothing good but that which is about the ground) I reckon the Cucumber: a fruit that *Tiberius* the Emperour much loued and affected: for he tooke such a wondrous delight and pleasure therein, that therewas not a day went ouer his head, but he had them serued vp to his table. The beds and gardens wherein they grew were such as went vpon frames to be remoued euery way with wheelles: and in winter, during the cold and frosty daies, they could draw them backe into certaine high couert buildings exposed to the Sun, and there house them vnder roufe. Moreouer, I find in some ancient Greek writers, that their seed ought to lie 2 daies in steepe, or infused in honied milke, before they be prickt or set into the ground: for by that meanes the Cucumbers will be the sweeter and more pleasant. The nature of them is to grow in what forme and fashion soeuer that a man would haue them. Throughout all Italy, green they be of colour, and least of any others: in the out-prouinces they be as fair and great, and those either of a yellow color, like wax and citrons, or els blacke. In Affrick or Barbary men take delight to haue the greatest plenty of them; whereas in *Moesia* they lay for to haue them passing big and huge. Now when they exceed in greannes they be called *Pepones*, is *Melons* or *Pompons*. Let a man eat them alone, they will lie raw and greene in the stomacke a whole day, and neuer be digested: howbeit, with meats they are not vnwholsom, and yet for the most part swim they will aloft, and ride vpon a mans stomacke. A wonderfull thing in their nature: they cannot abide oile in any wise, but water they loue well; inso much, as if they be cut off, or fallen from the place where they grew, they wind and creep therinto, if it be but a little way off: contrariwise, if they will as fast from oile, if a man set it by them, and in case any thing be in their way to let them, or that they hang still vpon their plant, a man shall perceiue how they wil turn vp and crook, to shun & auoid it. This amitie to the one, and enmity to the other, may be seene euen in one nights space: for if a man set vnder them, 4 fingers off where they grow, a vessel with water ouer-night, he shal see by the morning that they wil come downe to it: contrariwise, let oile stand the like distance from them, shrink they wil from it, and hook vpward. Marke another experiment in the cucumber. If when it hath don flourishing, you enter the knot of the fruit into a long cane or trunk, it will grow vpon a wonderfull length. But behold a very straunge and new fashion of them in *Campaine*, for there you shall haue abundance of them come vp in forme of a Quince. And as I heare say, one of them chanced so to grow first at a very venture: but after from the seed of it came a whole race and progeny of the like, which therupon they cal *Melo pepones*, as a man would say, the quince pompons or Cucumbers. These neuer hang on high, but go low by the ground, and gather round in form of a globe. A strange case it is of this kind: for, ouer and besides their shape, their color, and fauor different from the rest; they are no sooner ripe, but presently they fall from the stele or taile wherto they grew, notwithstanding they hang not hollow from the ground, where their owne poise might weigh them downe. *Columella* tells of a pretie deuise that he hath of his own, how to keep of them fresh all the yere long: chuse (quoth he) the biggest bramble you can meet with among a thousand, translate it into a warm/sun-shine bank, and there replant it: then cut it off, leauing not about 2 fingers breadth from the root about the ground [but this must be don about the Spring Equinox in mid-March:] then take a Cucumber seed, & set it within the soft pith of the said bramble, bank it will round about with fine fresh mould & dung blended together: This is the way, he assureth vs, to make that the roots therof bearing such cucumbers or Melons, will abide the greatest cold in Winter, and neuer shrink at it: of cucumbers, the Greeks haue set down 3 kinds, to wit, the *Laconick*, the *Scythick* & the *Bœotick*. Of which as they say, the first sort only they be that loue waters so well: some there be who prescribe to take the seed of Cucumber or Melon & to temper it in the iuice of a certain heerb stamped, which they cal* *Culix*, & then to sow it, perswading vs that we shal haue fruit therof without any seed.

* Some take it
for *Ceniza*,
i. Fleabane
Mulle.

Of the like nature (I meane for their manner of growing) be the Gourds. Winter and cold weather they cannot endure: they loue also places wel watered & dunged. As wel Gourds, as the cucumbers or Melons aboue said, are commonly sowed between the Equinox in March, & the Sunstead in Iune: provided alwaies, that their seed ly in a trench within the ground a foot & a

M

halfe

A halfe deepe. But in very deed, the best and meetest time to sow them is about the feast *Parilia*, howsoeuer there be some would haue the seed of gourds to be put into the ground presently after the Calends or first day of March: but of cucumbers about the Nones, i. the 7 day thereof, or at farthest, by the feast or holy daies of *Minerva*, named *Quinquatrus*. They loue both alike to creep and crawl with their winding top branches or tendrels, and gladly they would be clambering vpon walls, and climbing vp to the house rooffe, if they can meet with any rough places to take hold by; for naturally they are giuen to mount on high. Howbeit, their strength is not answerable to their will and desire: for stand they cannot alone without the help of some props, forks, or railles, to stay them vpright. Exceeding forward and swift they be in growth. They run on end when they are set on it: and if they may be born vp & sustained in maner asore said, they will gently ouerthade galleries, walking places, arbors, frames, & allies vnder them in a garden, and that right quickly. In regard of which nature and behavior of theirs, two principall kindes there be of them, the one *Camerarium*, as one would say, the frame or trail. Gourd, and cucumber, which climbeth aloft; the other *Plebeium*, i. the vulgar and common, which creepeth along the ground beneath. In the former kind it is worth the noting, to see how the fruit (heauy as it is) hangeth stiffe poised as it were in the wind, and will not stir, notwithstanding the stele whereto it groweth be wondrous fine and final. Moreouer, Gourds also may be fashioned in the head euery way as a man will, like as the Cucumbers or Melons before named: and specially within wicker cases made of pliable oifiers, into which they are put for to grow & to take their form, so soon as they haue cast their blossom. The nature of them (I say) is to receiue what figure a man will force and put them to: but commonly shaped they are in their growth like to a Serpent, winding and turning euery way. There haue bin known of them (such I meane as were of the traile kind) being led vpon a frame from the ground, and permitted to run at libertie, which grew to an incredible length, for one of them hath bin seen 9 foot long. As for cucumbers, they bloom not all at once, but by piece-meale, floure after floure, now one and then another: yea, and floure vpon floure, one vpon the head of another. Howsoeuer the Cucumber loueth waterish grounds, yet can he abide drier places also. Couered al ouer this plant and fruit is with a white down, euen at the first: but especially all the while he is in his growth.

Gourds are imploied sundry waies, and to many more vses than Cucumbers. For first, their yong and tender stalks be very good meat, and being dressed, are serued vp as a dish to the table: but the rind is of a cleane contrary nature. Gourds of late time came to be used in stoues and baines for pots and pitchers: but long before that, they stood in stead of rundlets or small barrels to keep wine in. The green of this kind hath a tender rind, which must be scraped notwithstanding before a dish of meat can be made thereof. And certes, albeit Gourds be of digestion hard, and such as will not throughly be concocted in a mans stomacke, yet they are taken to be a light, mild, and wholsom meate, as they be handled and dressed diuers waies, for that they make not a mans belly to swell, as some meats doe. Of those seeds which be found within the gourd next to the neck therof, if they be set, come the long gourds commonly: & such lightly you shall haue ingendred of those also that are in the bottom, howbeit nothing comparable to the other. Those that lie in the midst bring forth round ones: but from the seeds that are taken out of the sides, ordinarily there grow the shorter sort of Gourds, such as be thicke and broad. These grains or seeds would be handled in this manner. First they are dried in the shadow, and afterwards when a man list to sow them, they ought to be steeped in water. The longer & slenderer that a Gourd is, the better meat it yeelds, and more pleasant to be eaten: and therefore it is, that they be thought more wholsome which grew hanging vpon trailes; such indeed haue least store of seed within them. Howbeit, wax they once hard, away with them out of the kitchen, for then they haue lost all their grace and goodnes which commended them to the cooks dresser. Such as are to be kept for seed, the manner is not to cut vp before winter: and then are they to hang or stand a drying in the smoake, as proper stufte and implements to be seen in a country house, to keep, as good chaffer, seeds for the gardner against the time. Moreouer, there is a means deuised, how to preserve them and cucumbers too, for meat, sound and good, almost til new come; & that is, by laying both the one and the other in a kind of brine or pickle. Some say also, that they may be kept fresh and greene, interred in a caue or ditch vnder the ground in some darke and shady place, with a good course or bed of sand laid vnder them, and well couered afterward with dry hay, and earth vpon the same in the end. Ouer & besides, as in all plants

C 2

and

* *Cucumis
sylvestris,
Colocynthis,
or, Coloquin-
tida.*

and herbs in maner of the garden, there be both wild and tame: so is there of Gourds and Cucumbers both a certain * sauage kinde. Such are not for the kitchen, but for the Apothecaries shop, and good only in Physick: and therefore I will put off for this present the discourse of them & their nature, referring them for their seuerall treatises in other books concerning such medicinable simples.

As touching the rest of garden plants, which are of the like cartilage and pulpos substance, they be all the sort of them roots growing hidden within the ground: amongst which, I might seem to haue written already fully and sufficiently of Rapes and Turneps, but that the Physitians haue obserued in them both sexes, to wit, masculine & foeminin; for the rounder kind they wil haue to be the male, but the broader and flatter sort, which also are somewhat hollow, they account the female: and these last they hold to be the better far, and more pleasant, as being easier to be kept and condite; which also, if they be often removed and replanted, will turn to be males. Physitians likewise haue set downe five kinds of Nauewes, namely, the Corinthian, the Cleonæan, the Liothasian, the Boeotian, and that which simply by it self they called the green Nauew. Of all these, the Corinthian Nauews grow to a great bignes, and in maner all the root is seen naked about ground: for this is the only kind that coueteth to be aloft, and groweth not downward into the earth as the rest do. As for the Liothasian (some call it also the Thracian) of all others it will abide and endure frost and cold weather best. Next to it is the Boeotian nauew, sweet in tast, differing from the rest in the notable shortnesse and roundnesse withall that the root carrieth; nothing at all like to the Cleonæan, which is passing long. Generally this is obserued as a rule, that all Nauews, the slenderer, smaller, and smoother leaues that they beare, the more pleasant is their root to the tast: and contrariwise, the rougher that they be, the more cornered also and prickly, the bitterer they are. There is a wild kind of them besides, the leaues wherof resemble Rocket. The best Nauews that are sold at Rome, be those that come from Amitemum in Bruzze. The next to them in goodnes are those of Nursium. In the third place are they to be ranged which our country * about Verona yeelds. As concerning all things els, and namely the maner of sowing them, I haue said enough in the treatise of Rapes or Turneps.

* or rather
italie.

As for Radishes, their roots do consist of a rind without, & a cartilage or pulpos substance within: and verily many of them are known to haue a thicker skin or rinde than the barke is of some trees; bitter such are, more or lesse, according to the thickness of the said rind: otherwhile also the rest is all pith, and as hard as wood. All Radishes breed wind wonderfull much, & prouoke a man that eateth of them, to belch. A bafe and homely meat therefore it is, and not for a gentlemans table, especially if it be eaten with other worts, as Beets: many if a man take them with vnripe oliues condite, he shall neither belch or rift wind so much, ne yet so soure and stinking will his breath be afterwards. The Egyptians make maruellous great account of radishes, for the plenty of oile that they draw out of the seed: and therefore a great desire they haue to sow them if they may: for as they find it more gainful than corn, so they pay lesse tribute & custom in regard of that commoditie, and yet there is nothing yeeldeth more abundance of oile.

* *Thesophrastus*
writeth all this
of *Brassica*.
See how *Pliny*
is ouersciet
but that is no
newes with
him.
* Here he seemeth
to come
again to the
radish indeed.

* The Greeks haue made three sorts of Radishes, differing all in leafe: the first crisped and curled like a ruffe, the second smooth and plain, the third wild and sauage; and these wild ones verily haue smooth leaues, but short and round: plentiful also they be, and otherwise full of branches: a rough and harsh tast they haue, howbeit medicinable they be, and as good as a purgation to loosen the belly and make it laxatiue. As for the other two former kindes, a difference there is in the seed, for in some it is very fair & good, in others as small and bad: howbeit these imperfections light vpon none but such as haue the crisped and frizled leaues. * Our countrymen here in Italy haue made other kinds thereof; to wit, *Algiclenfe*, so called of the place: long they be, transparent and cleare, that a man may see through them. A second sort there be fashioned in maner of a Rape root, and those they call *Syriaca*, the sweetest for the most part of all others, and tenderest, such also as will hold out best against frost and winter weather. Yet the principal and very best indeed are those, which as it should seem were but lately brought out of Syria (at leastwise the seed of them) for that in no writers there is found any mention made of them: and they will continue all winter long.ouer and besides all these, there is one sauage kind of them more, which the Greeks name *Agrion*: the inhabitants of Pontus, Armon; others, *Leuce*; and our countrymen giue it the name of *Armoracia*: more shew it maketh in leafe than in the root or all the body besides. Moreover, the best token to know good Radishes by, is their stem

A stem or stalk: for such as bite at the tongues end, haue rounder and longer stems than the other that be mild: they haue long and hollow gutters also: the leaues besides are more bitter and vn-sauorie, cornered, more rough, and vntoward to be handled. Radish seed would willingly be sowne in a loose or light ground, and nathelesse moist enough: it cannot abide rank mucke, but contenteth it selfe with rotten chaffe or pugs, and such like plain mullock. It lixes and thrives so well in cold countries, that in Germanie a man shall haue their roots as big as pretty babes. To haue Radish roots in the spring, the seed would be sowed presently after the Ides or 13 day of Februarie: and a second time again about the feast of * *Vulcan*, which is indeed the better season for Seednes. Many there be that put the seeds into the ground in March, Aprill, and September. When they are come vp and begin to grow to some bignes, it is very good to enterre B and couer with mould round about the leaues, now one, and then another; but in any case to banke the roots well with earth: for looke how much appeareth bare about ground, proues either to be hard, or els fungous and hollow like a Kex, and nothing good to be eaten. *Aristomachus* would haue them to be stript from their leaues in winter, & in any hand to be banked well about, that the water stand not there in any hollow furrow or hole lower than the other ground; promising vs by this means, that they will proue faire and big against Summer. Some haue reported, that if a man make a hole in the ground with as big a stake as he wil, and strew or lay it in the bottom with a bed of chaffe six fingers deepe, and on it bestow his seed, with muck and mould heaped thereupon, the roots will grow so big as to fill vp the said hole full. Howbeit, in briefe, Radishes are best nourished and maintained in salt grounds: and therefore with such kind C of brackish waters they vse to be watered, which is the reason, that in *Ægypt* there are the sweetest and daintiest Radishes in the world, for that they are bedewed and sprinkled with Nitre. And verily it is thought, that they will lose all their bitterness whatsoeuer if they be corned or seasoned with salt, yea and become as if they were sodden and condite: for be they boiled once, they proue sweet and serue to be eaten in stead of Nauewes. And yet Physicians giue counsell and prescribe, That they should be eaten raw in a morning with salt, when a man is fasting, for to gather into the stomack the sharp humors and excrements that charge the belly & entrails; and thus taken, they are of opinion, that it is a good preparatiue to vomit, and to open the passages well for to avoid those superfluities. They giue out also, That the juice of Radish roots is singular good and necessarie for the midriffe, and the præcordiall parts about the heart; and namely, that nothing else but it, was able to cure a Phtisicke or vicer of the lungs, which had settled deep and taken to the heart: The experiment end prooffe whereof was found and seen in *Ægypt*, by occasion that KK. there, caused dead bodies to be cut vp, and anatomies to be made, for to search out the maladies whereof men died. It is reported, that the Greeks (as they be otherwise vaine in all their actions) so highly preferred the Radishes before other meats, in regard of the good nourishment, that whereas in an oblation out of the garden-fruits to be offered vnto *Apollo* in his temple at Delphos, they dedicated the Beet in siluer, and the Rape or Turnep in lead, they presented a Radish in beaten gold. A man may know hereby, that *Manius Curius* the great General of the Romane armie, was not that countreyman borne, whom the Samnite Embassadors (when they brought to him a great present of gold [vpon condition to surcease arms] which he meant to refuse and not accept at their hands) found roasting of a Rape or Turnep root at the chimney fire; according as we find in the Annals and Chronicles of the Roman history. To come again vnto our Radishes, *Moschian* the Greek writer so highly esteemed this root, that he compiled one whole booke of the Radish, and nothing els. Indeed Radishes are thought excellent good with meats in Winter time: howbeit they alwaies wear and marre their teeth who eat of them: and yet I assure you they wil polish Iuorie, which is nothing els but the Elephants tooth. * Between a Vine and a Radish, there is by nature a secret enmitie and exceeding great hatred, inasmuch as if Radishes be sowed neere vnto her, she will writh and turne away sensibly from them.

* 11 Cal. Iun.
or as some
think, 13 Cal.
Iun. i. the 20
or 22 day of
May. This feast
was named
also *Lugria*.

* Here *Pliny*
forgetteth
himselfe as
gaine: for this
is verified of
the Colewort,
and not of the
Radish.
* Some call
these Mad-
rips.

Touching other sorts of cartilage or pulpos plants in the garden, wherof I haue before spoken, they be all giuen to run much to pith, and to be of a more woodie substance. A man would maruell therefore that they should all tast so strong and sharpe as they doe. Of which there is one kind of wild Parsnep growing of it selfe, which in Greek is * called *Staphylinas*. A second sort is set of a plant with the root and sowed of seed, either in the prime of spring, or els in Autumne: howsoeuer *Hysmus* would haue them to be put into the ground in Februarie, August, C 3 September,

September, and October; and that the plot where they are to grow, should be digged and del-
 ued very deep. This root beginneth to be good at the first yeres end, but better it is if it be two
 yeres old: howbeit both the one and the other, is counted wholsommer in Autumn than at any
 other season of the year, especially boiled and serued vp betweene two platters, and yet dresse
 them so well as you can, they will not be rid of that strong, ranke, and churlish smacke which it
 hath. As for * Hibiscum, it differeth from the Parsnip aforesaid onely in this, That it is more
 slender and smaller, rejected altogether from the table, and condemned for no good meat, how-
 beit medicinable, and vsed much by the Physitian. A fourth kind there is beside, resembling al-
 so the Parsnip, which our countrymen the Latines name the French Parsnip, but the Greekes
 Daucus, [i. the yellow Douke or Carot] which they haue subdiuided into foure speciall sorts.
 The * Skirwirt root or white Parsnip, (which indeed would be written among other Physicke
 plants) was likewise in great name and credit by the means of the foresaid Emperour Tyberius
 who was very earnest to haue them yearly brought out of Germanie, and euer he would cal for
 them at his own table. And indeed about Gelduba (a castle situat vpon the riuer Rhene in Ger-
 manie) there was an excellent kind of them that grew to be passing faire, from whence he was
 serued, whereby it appeareth, that this plant loueth cold regions well. These roots haue a string
 in manner of a pith or sinew, running all the length thereof, which the cooke vseth to take forth
 after they be sodden; yet for all that there remaineth still in them a great deale of bitteresse:
 howbeit being wel tempered & delaiued with a sauce of mead or honyed wine, and so eaten with
 it, euen the same bitteresse turneth to a good and pleasant tast. The greater Parsnip Pastinaca,
 hath the like nerue or string aforesaid (such only I mean as are a yere old.) The right season to
 sow the Skirwirt or Parsnip Sifer, is in these moneths, to wit, Februarie, March, Aprill, August,
 September, and October.

* Some take it
 for *Althaea* or
 the marsh
 Mallow.

* Sifer.

* *Inula*.

The * Elecampane hath a root shorter than the Skirwirts or Parsnips aforesaid, but more
 musculous and fuller as it were of brawn; bitterer also: in which regards, if it be taken simply a-
 lone, it is aduerse and contrarie to the stomach; but joined & confected with some sweet things
 among, it is very holsum. And many deuises haue bin practised with it to take away that harsh
 and vntoward bitteresse which it hath, whereby it is become toothsome and pleasant enough:
 for some there be who stamp it drie and so reduce it into a powder: then they mix it with some
 sweet liquid fyrrup, and being thus tempered, serue it vp. Others seeth it in water and vinegre
 mingled together, and so keepe it condite. Infused also it is many waies, and afterwards either
 preferred in cuir, or incorporat with hony in manner of a conserue, or els with dried Raisons of
 the Sun, or last of all with faire and fat Dates. Moreover, diuers there be, who after another sort
 make a confection therof, namely with Quinces, with Sornises, or Plums, mixing therewith one
 while Pepper, another while Thym. And I assure you this root thus confected (as is aforesaid)
 is singular good for faintings, and especially quickneth the dulnes and defect of the stomach.
 The Empreisse *Tulia Augusta* passed not a day without eating the Elecampane root thus confe-
 cted and condite: and therupon came it to be in so great name and bruit as it is. The seed ther-
 of is needlesse and good for nothing: therefore to maintaine and increafe this plant, gardeners
 vse commonly to set the joints cut from the root, after the order as they doe Reeds and Canes.
 The manner is to plant them as well as Parsnips, Skirwirts, and Carrots, at both times of seed.
 nes, to wit, the Spring and the Fall: but there would be a good distance betweene euery seed or
 plant, at least three foot, because they spread and braunch very much, and therewith take vp a
 deale of ground. As for the Skirwirt or Parsnip Sifer, it will do the better if it be remoued and
 replanted.

* *Cariotis*, some
 reade *Cariot*,
 i. Figs.

It remaineth now to speak in the next place of plants, with bulbous or onion roots and their
 nature, which *Cato* recommendeth to Gardeners, and he would haue them to be fer and sowed
 aboue all others: among which, he most esteemeth them of Megara. Howbeit, of all this bul-
 bous kind, the Sea-onion Squilla is reputed chiefe and principall, notwithstanding there is no
 vse of it but in Physick, and for to quicken vinegre. As there is none that groweth with a bigger
 head at the root, so there is not any more agre and biting than it. Of these Sea-onions, there
 be two kinds medicinable; the male, with the white leafe, the female, with the blacke. There is
 a third sort also of Squilla, which is good for to be eaten: the leaues whereof be narrower, and
 not so rough and sharp as the other, and this they cal Epimenidium. All the sort of these squil-
 les are plentiful in seed: howbeit they come vp sooner if they be set of cloues or bulbos which
 grow

G

I

K

L

M

A grow about their sides. And if a man would haue the head of the root wax big, the leaues which
 vsually be broad and large, ought to be bended downe into the earth round about, and so coue-
 red with mould; for by this means all the sap and nourishment is diuerted from the leafe and
 runneth backe into the root. These Squils or sea-onions grow in exceeding great abundance
 within the Balear Islands and Ebusus, as also throughout all Spaine. *Pythagoras* the Philoso-
 pher wrote one entire volume of these onions, wherein he collected their medicinable vertues
 and properties, which I meane to deliuer in the next booke.

As touching other bulbous plants, there be sundry kinds of them, differing all in colour,
 quantity, and sweetnesse of tast: for some there bee of them good to be eaten raw, as those of
 Cherrhonesus Taurica. Next vnto them, are they of Barbary, and most commended for good-
 nesse, and then those that grow in Apulia. The Greeks haue set downe their distinct kinds in
 these terms, Bulbine, Seranios, Pythios, Acrocorios, * *Egylops*, and Sifyrinchios. But strange
 it is of this Sifyrinchios last named, how the foot and bottom of the root will grow downe still in
 winter, but in the Spring when the Violets appeare, the same diminisheth and gathereth short
 vpward, by which meanes the head indeed of the root feedeth and thrieth the better. In this
 rank of bulbous plants, is to be set that, which in Egypt they call Aron, [i. Wake Robin:] for
 bignesse of the head it commeth next to Squilla before said: the leaues resemble the herb Pati-
 ence or garden Dock: it riseth vp with a streight stem or stalke two cubits high, as thicke as a
 good round cudgell. As touching the root, it is of a soft and tender substance, and may be eaten
 raw. If you would haue good of these bulbous roots, you had need to dig them out of the ground
 before the spring, for if you passe that time, they will presently be the worse. You shall know
 when they be ripe and in their perfection by the leaues; for they will begin to wither at the bot-
 tom. If they be elder, or if their roots grow small and long, they are rejected as nothing worth.
 Contrariwise, the ruddy root, the rounder and the biggest withall, are most commended: know
 this moreover, That the bitteresse of the root in most of them, lyeth in the crowne (as it were)
 or top of the head; for the middle parts be sweet. The antient writers held opinion, That none
 of these bulbous plants would grow, but of seed only: howbeit, both in the pastures and fields
 about Preneste, they come vp of themselves: and also among the corn lands and arable grounds
 of the Rhenians, they grow beyond all measure.

* rather, *Heme-*
rocure.

D

CHAP. VI.

¶ Of the roots, leaues, floures, and colours of Garden-herbes.

ALL Garden plants ordinarily, put out but one single root apiece; as for example, the Ra-
 dish, Beet, Parsley, and Mallow: howbeit the greatest and largest of all others is the root
 of the herb Patience or garden Docks, which is knowne to run downe into the ground
 three cubits deep. In the wild of this kind (which is the common docks) the roots be smaller,
 yet plumpe and swelled; whereby, after they be digged vp and laied aboue ground, they will liue
 a long time. Some there be of them that haue hairy strings or beards hanging to the roots, as
 namely Parsley or Ach, and Mallows. Others there be againe, which haue branching roots, as
 the Basill. As the roots of some be carnosous and fleshy altogether, and namely of the Beet, but
 especially of Saffron; so in others they consist of rind and carnositie both, as we may see in Ra-
 dishes and Rapes or Turneps. And ye shall haue of them that be knotty and full of ioints, as for
 example, the root of the Quoich grasse or Dent-de-chien. Such hearbs as haue no streight and
 direct root, run immediately into hairie threds, as we may see plainly in the Orach and Blect: as
 for the sea Onion Squilla, and such bulbous plants, the garden Onions also and Garlicke, they
 put forth their roots streight, and neuer otherwise. Many hearbes there be, which spring of their
 own accord without setting or sowing, and of such many there be that branch more & cloue in
 root than in leafe, as we may see in Aspalax, * *Parietarie* of the wall, and Saffron. Moreover, a
 man shall see these hearbes floure at once together with the Ash, namely, the running or cree-
 ping Thyme, Southernwood, Naphewes, Radishes, Mints, and Rue; and by that time as others
 begin to blow, they are ready to shed their floures: whereas Basill putteth forth floures by par-
 cels one after another, beginning first beneath and so going vpward by Ieisure: which is the
 cause that of all others it is longest in the floure. The same is to be seene in the herb Heliotro-
 pium (i. Ruds or Turnsol.) In some the floures be white, in others yellow, and in others purple.

* *Pardicium*.

As

Gethyam.

As touching the leaues of herbes, some are apt to fall from their heads or tops, as in Origan and Elecampane, yea, and otherwhiles in Rue, if some iniurie be done vnto it. Of all other herbes, the blades of Onions and * Chibbols be most hollow. Where by the way I cannot ouerpasse the foolish superstition of the Egyptians, who vse to sweare by Garlick and Onions, calling them towitnesse in taking their othes, as if they were no lesse than some gods. Of Onions the Greeks haue deuised sundry kinds, to wit, the Sardinian, Samothracian, Alsidian, Setanian, Schista [i. the clouen Onion] and Afcalonian [i. little onions or Scalions] taking that name of Afcalon a city in Iury. They haue all of them this propertie besides, to make ones eyes water, and to ferch out teares, being smelled to, especially they of Cypros: but the Gnidian onions least of all others cause one to weep. In all kinds of them the body of the root consisteth of a certaine fatty pulp or cartilage. For quantity the Setanian be least, except the Tusculane: howbeit such are sweet. The clouen onions & the scalions aforesaid are proper for to make sauce of. As touching that kind of them called Schista, gardeners leaue them all winter in the ground with their leaues or head standing: in the spring they pluck off the said leaues, and then shal you see spring forth others vnderneath, according to the same clifts and diuisions, whereupon they tooke the name Schista. After which example, the like practise in all other kindes is prescribed, namely, to pull the leaues off, that they should grow rather big in root, than run vp to feed. The Afcalonian onions haue a proper nature & qualitie by themselves; for they be barren as it were, from the root, and therefore the Greeks would haue them to be sowed of seed, and not otherwise to be set of heads. Besides, that they should be translated & replanted again late, about the spring, at what time as they put forth blade: for by this vsage (say they) you shal haue them burnish and grow thicke, yea, and then make haist for amends of the former time foreslipped. These must be gathered betimes, for after they be once ripe, quickly will they rot in the earth, if you make not the better haist to pluck them vp. If you set or plant their heads, a stalke they wil put forth and feed vpon it, but the onion it selfe will consume and come to nothing. Moreouer, there is a difference obserued in the colour of onions; for they that grow in Samos and Sardis, be most white: those also of Candy be much esteemed; and some there be who doubt whether they be the same that the Afcalonian, or no: for that if they be sowed of seed, their heads or roots will grow big: set them, they will be all stem and feed, and no head at all. As for the relifish or taste that onions haue there is no great diuersitie, but that some are sweeter than other. Our onions here in Italy be all of two sorts principally: the one which serue for sauce to season our meats, which the Greeks call Gethyon Chibbols; but our countrymen the Latines, Pallacana: these are sowne commonly in March, April, and May: the other is the great headed onion; and these be put into the ground either after the Equinox in Autumne, or els after mid-February, when the West wind Favonius is aloft. Moreouer, onions are diuided into sundry sorts, according to the degrees of their pleasant or vnpleasant and harsh tast; to wit, the African, French, Tusculan, and Amiternium. But euermore the best are the roundest. Item, the red onion is more keen and angry than the white: the dry, and that which hath lien, is more eage and sharp than the green newly drawn: the raw also more than the sodden: and finally, the dry by it selfe more than that which is condite and preserued in some liquor for sauce. The Amiternium onion is planted in cold & moist grounds: and this alone would be set of a head in maner of garlick cloues, where-as the rest will come of seed. Onions, the next summer following after they be sowne, put forth no feed, but head only, which groweth, and the leafe or stem drieth and dieth. But the next yere after, by way of interchange, it bringeth forth seed, and then the head rotteth. And therefore euery yere they vse to sow onion seed apart in one bed by it selfe, for to haue onions: & set onions for seed in other, by themselves. The best way to keep onions, is in corn, chaf, and such like pugs. As for the Chibbol, it hath in maner no distinct head at all, but only a long neck, & therefore it runs in maner all to a green blade; the order is to cut and sheare it often in maner of porret or leeks; which is the cause that they sow it also of seed, and do not set it. Ouer and besides, before we sow onion seed, the plot, by mens saying, ought to haue three diggings, for to kill and rid out of the ground the roots of hurtful weeds: and ten pound of seed ordinarily wil sow an acre. Here and there amongst would be Sauerie sowne, for the better will the Onions like and prosper with the companie of that hearbe. Also, after the ground is sowne, it requieth weeding, farcling, or raking, foure times at the least, if not oftner. Our neighbours in Italie sow the Afcalonian Onion in the moneth of Februarie: whose manner is also to gather Onion feed

A feed when it beginneth once to wax black, before it fall to wither.

Seeing now that I am entred thus far into a discourse of Onions, I shal not do amisse to treat of Leeks also, in regard of the neare affinitie betweene them: and the rather, for that it is not long since, that the Porret kind which is often kept downe with clipping and cutting, came into great name and credit, by occasion of the Emperor Nero, who vsed for certaine daies in euery moneth for to scoure his throat, and cleare his voice, and to take it with oile, on which daies he did eat nothing els, not so much as bread. Wee vse to sow them of seed, after the Equinox in September: and if we meane to make cut Leeks thereof, the seed would be sowed the thicker. These Leeks are kept downe with clipping and shearing still vntill the root faile, without removing them out of the same bed where they were sown: and alwaies they must be plied with dung. But before they be cut, nourished they ought to be, vntill they haue gotten a good head. When they are wel grown, they are to be translated into another bed or quarter, & there replanted: hauing their vppermost leaues lightly shriged off, without comming to the heart or marrow which is their body next to their roots: and their heads set deeper downward, yea, and their vtmost pellicles and skins sluied from them. In old time they vsed to put vnder their root a broad flint stone, or els a tile, which did dilate their heads within the ground, and make them spread the better. This they practised also in other bulbous plants, as Onions, &c. thereby to haue the fairer heads. But now in these daies the maner is, lightly to barbe & pluck off with a farcling hook, the beards or strings of the root, that being thus nipped and lipped (as it were) they might nourish the body of the plant, & not distract and suck away the humor, which is the nutriment of the whole. This is notable and wonderfull in the Porret, that ioying & liking as it doth in muck and fat ground, yet it cannot abide watery places. Howbeit, in these we must be ruled by the property of the ground, which is al in all: the principal leeks be in Egypt: the next are those of Ortia & Aricia. Of the cut Porret or vnset Leeks be two kinds: the one runneth mightily into a green blade, and the leafe thereof hath very conspicuous & euident cuts; & this is that the Apothecaries vse so much: the other hath a more pleasant and yellowish leafe, and the same rounder, the gashes or cuts whereof are smaller, & not so apparent to the eie. The voice goeth, & generally it is reported, That Mela a knight or gentleman of Rome by his place, & Procurator vnder Tiberius the Emperor, being for some misgouernment in that office, brought into question and accused, & thereupon sent for peremptorily to make his personal apparance, despairing utterly of life, tooke the weight of three Roman siluer deniers in the iuice of Leeks, and dranke it off: whereupon he died incontinently without any paine or torment at all. It is commonly said, That if a man take a greater dose or receipt thereof, it will do no harm, nor any danger will insue thereupon.

As touching Garlick, it is held for certain, That it is a soueraigne medicine for many griefs and maladies; especially such as are incident to the country peasants and rusticall people, who hold it to be as good as a Treacle. The Garlike head is couered and clad all ouer with certaine very fine and thin pellicles or membranes, which may be parted and diuided one from another, vnder which you shall see it compact and ioined (as it were) together of many cloues in maner of kernels, and those also inclosed each one apart within their leuerrall skins. Of a sharp and biting tast it is. The more keen and eage also you shall find it, as it hath more of those cloues aforesaid in one head. The aire that comes from it, is as offensive as that of the onion, & maketh their breath as strong who eat it: howbeit, sodden if it be, it is euery way harmles: the difference and diuersity of Garlick ariseth first, from the circumstance of the time, whereby you shall see a kind of hasty Garlick, that in 60 daies will be ripe and come to perfection: then, in quantity, for some grow bigger in the head than other. And of this sort is that which wee call in Latine Vlpicum: and the Greeks, some the Cyprian Garlick, others, * Aphroscorodon: so much commended in Africke, that it is held for the most principall dish of meat that a Husbandman of the country can eat: and bigger it is than our common Garlick. Being brused and braied in a mortar together with oile and vineger, it is wonderfull to see what a fume and froth will arise thereof, and to what an height it wil swell thereby. Some gardeners there are, who forbid to set either this Vlpicum, or the common Garlick in any euen, flat, and leuell bed; but to put them in little hillocks [in maner of hop hills] raised in forme of castles or turrets, three foot distant one from another. Now, wherefoeuer these cloues be set in hill or plain, they ought to lie foure fingers breadth asunder. And this would not be forgotten, That so soon as they shew three leaues once,

once, they would be sarded, and the mould raised from about them: for the oftner they be thus serued and laid bare, the fairer heads they will bring. When they begin to grow big and come to their full maturity, the stalks that they run vp vnto, must be troden downe and moulded ouer: and this is to preuent, that they should not be ouer-rank in blade. In cold countries it is thought better and more profitable to set them during the spring, than at the fall of the lease. Moreouer, if you would haue Garlick, Onions, and such like, not to smel strong and stink so as they do, the common opinion & rule is, that they should not be set or sown, but when the moon is vnder the earth, nor yet be gathered and taken vp but in her coniunction with the Sun, which is the change. But *Menander*, a Greeke writer saith, That there needs none of all these ceremonies for the matter: for if a man would not haue his breath stink with eating of Garlick, let him, do no more (quoth he) but take a Beet root roasted in the embers, and eat it after, it shall extinguish that hot and strong sauer, and cause the breath to continue sweet. There be who thinke with that the fittest time of setting both the common Garlick, & also the greater kind named *Vlpi-* that the fittest time of setting both the common Garlick, & also the greater kind named *Vlpi-* cum, is between the two set and ordinary feasts * *Compitalia* & * *Saturnalia*. As for the vulgar Garlick, it commeth vp also of seed, but slowly, and late it will be first ere it attaine to the full prooffe: for the first yere it getteth a head no thicker than Leeks; the next yere after, it begins to diuide into cloues; and in the third it is consummate and grown to perfection: and such vn-set Garlick, some are of opinion to be fairer and better than the rest. Howbeit, Garlick indeed should not be suffered to bol and run vp to seed, and therefore the blade therof ought to be wreathed, that it may gather more and stronger in the head, and that the cloues afterwards might be set in stead of seed for increase. Now if a man haue a desire that both Garlick and Onions may be kept long for his prouision, their heads must be dipped and wel plunged in salt water, warm; by this means indeed last they will longer without spurtting, and be better for any vse wee shall put them to, saue only to be set and replanted in the ground; for barren will they be, and neuer prosper. And yet diuers there are, who thinke it sufficient at the first to hang them in the smoke ouer quick and burning coles; as being perswaded, that this will serue wel enough to keep them from growing; for certaine it is, that both Garlick and Onions will put forth blade aboue ground, and when they haue so done, come to nought themselves, as hauing spent all their substance and vertue. Some are of this mind, that the best preseruing of Garlick as well as of Onions, is within chaffe.

* 11. Calend. IANUAR.
* 14. Calend. IANUAR. Between the 18. & 21 of December.

There is a kind of Garlick growing wild in the fields of the own accord, which they call in Latine *Alum* [i. Crow Garlick] which being boiled that it should not grow, they commonly throw forth in corn fields for the shrewd and vnhappy foules which lie vpon the lands, and eat vp the seed new sown: for presently as any of those birds tast thereof, they wil be so drunke and astonied therewith, that a man may easily take them with his hand: yea, and if one stay a little, he shall see them fall asleep therewith. Finally, there is another kind of sauge or wild Garlick called *Vrsinum* [i. Beare Garlick] the head whereof is very small, the blade or leaues great and large, and the sauer or sent mild and gentle, in comparision of the rest.

CHAP. VII.

In how many daies euery herbe that is sowed will come vp and appeare aboue ground. The nature of seedes. The manner of sowing any of them Which they be, whereof there is but one single kind: and which haue many sorts.

AMong all the herbes sowne in a garden, these come vp soonest, to wit, Bassill, Beets, Navews or Turneps, and Rocket: for by the third day the seed will breake and spurt. Dill seed will chit within foure daies, Lettuce in fise, Radish in fixe, Cucumbers and gourds in a seuen-night, but the Cucumber first. Cresses and Mustard seed in fise daies, Beets in six by Summer time, and by winter in ten. Orach in eight daies, Onions in 19 or 20 at the farthest, Chibols in ten or twelue at the most. Coriander seed is more stubborne, and will not shew so soone. Saue-rie and Origan seed lieth thirty daies ere it come: but of all others Parsley seed is latest ere it spring; for when it commeth vp soonest, it is forty daies first: but for the most part it lieth fifty daies before it appeare. Something there is also in the age of the seed: for the newer that the seed is either of Leeks, or Chibols, Cucumbers & gourds, the more hast it maketh to be aboue ground: contrariwise, Parsely, Beets, garden Cresses, Sauery, Origan, and Coriander, grow sooner

A ne r of old seed. But the Beet seed hath a strange and wonderful quality aboue the rest: for it will not come vp all in one and the same yere. But some in the first, others in the second, and the rest in the third. And therefore sow as much seed as you will, yet shall you haue it grow but indifferently. There be herbes which wil grow and beare but one yere and no more: and there be other again which will continue many yeares together, as for example, Parsely, Porret, & Chibbols. For, so these but once in a garden, they will beare from yere to yere from the same root, or els sow themselves. The most part of herbes do beare round seed, in some the seeds are long; in few, broad and flat in manner of a leafe, as in Orach. You shall haue seed also narrow & chamfered, like a gutter tile, as that of Cumin. Moreouer, there is a difference in colour, for some seeds be white, others black: in hardnesse also and softnesse; for some be harder or softer than others.

B Some seeds at every branch of the plant, are contained within cods or bladders, as we may see in Raddish, Senuie, and Turneps or Rapes. The seeds of Parsely, Coriander, Dill, Fenell, & Cumin, grow naked & bare. But that of the Bleet, the Beet, Orach and Basil, is inclosed in a huske or hull. Lettuce seed lieth within a downe. As touching Bassill afore said, nothing fructifieth more than it: & to the end that it may come vp in more plenty & abundance, they say it should be sowed with maledictions and ill words; for the more that it is cursed, the better it wil speed and prosper: yea, and when it is sowed, the mould of the bed must be parted and rammed down in manner of a pauement. And more particularly, they that sow Cumin, pray to God that it may neuer come vp. Such seeds as lie within an husk, hardly come to be dry and ripe therein: but Basil seed especially, and Gith or *Nigella Romana*. But they must be all thoroughly dried before they be seedow and fruitfull. This is general in all herbes throughout, that they wil thrive and grow the better, if their seede bee sowed by heapes one vpon another, than scattering. And certainly both Leeks seed is sown & Garlick cloues set in that wise, namely, bound vp & tied together in some clouts or ragges wherein they be lapped. As for Parsely seed, against it should be sown, there would be an hole made with a little wooden dibil or pin, & therein it must be put with some dung after it. Furthermore, all garden herbes come vp either of seed and cloues set, or els of slips pulled from the mother-plant. Some grow of seeds and sprigs both, as Rue, Origan, & Basil; for euen this herb also last named will abide cutting when it is come to be one handbreadth, or a span high; and those cuttings will grow if they be planted. There be that are maintained by root and seed both, as Onions, garlick, and those which haue bulbous roots: like wife, all such as when they haue born yere, leaue a root behind them stil in strength & vertue. Of such as grow of roots replanted, their roots continue long & branch much, as we may see in the bulbs, in Chibbols, & sea onions. Others put out branches sufficient, but not from the head or root, as Parsely and Beets. All herbes for the most part, do spring & shute again, if their stalke be cut off; vnlesse it be those that haue a smooth stem. And this is most seen in Basil, Raddish, & Lettuce, the stems whereof are cut for many purposes. And as for Lettuce, men hold, that the later spring thereof, when the first is gon, is the sweeter. Certainly, Raddishes eat the more pleasantly, if their leaues be ctopt off before the master stem or spire be growne big. And this also we obserue in Rapes or Turneps; for if you strip them also from their leaues & couer them ouer head with earth, yet will they grow all winter and continue till Summer following. Touching

E Bassill, Sorrel, red Porret or Bleet, garden Cresses, Rocket, Orach, Coriander, they are all of one sort, & singular in their kind: for sow them where you wil, they be the same stil, neither are they better in one place than in another. It is a common receiued opinion, that Rue wil grow the better if it be filched out of another mans garden: and it is as ordinary a saying, that stolen Bees wil thrive worst. Some herbes there be which come without sowing or setting, as wild Mint, Nep, Endiue, and Penirol. But howsoeuer there be but one single kind of those before rehearsed, yet on the contrary side, there be many sorts of others, which wee haue already spoken of, and will write more hereafter, and principally of Ach or Parsely.

CHAP. VIII.

Of Garden herbes which serue for to season our meats: their diuers natures, their sundry kinds and seuerall histories related, to the number of 36.

F Or, that kind of Ach which groweth of it selfe in moist grounds with * one leafe, and is not rough, but smooth and plaine, is called in Greeke *Helcoselinon*, i. Smallach. Again, there is ano-

*variegation 2 for so it should seem that Pliny read it in Theophrastus: whereas indeed it is *hantzianum*, i. with leaues growing thin*

* For some
resemblance
of Parsley.

three kinds of them: the first, that stretcheth out broad leaues at ful, and carieth a big stem, the second, with a crisped and frizled leafe, the which he calleth *Apiana: the third is smooth, plain, and tender in leafe, and hath but a little stalke; and these are of no reckoning at all with *Cato*. Moreover, like as Coleworts may be cut at all times of the yeare for our vie, so may they be sown & set at the yere long: & yet the most appropriat season is after the *Æquinox* in Autumne. Transplanted they be when they haue once gotten fixe leaues. The tender crops called *Cymæ* after the first cutting, they yeeld the Spring next following: now are these *Cymæ* nothing else but the yong delicate tops or daintier tendrils of the maine stem. And as pleasant and sweet as these crops were thought to other men, yet *Apicius* (that notable glutton) tooke a loathing of them; and by his example *Drusus Caesar* also careth not for them, but thought them a base and homely meat; for which nice and dainty tooth of his, he was well checked and shent by his father *Tiberius* the Emperour: after this first crop or head is gone, there grow out of the same colewort other fine colliflories (if I may so say) or tendrils, in Summer, in the fall of the leafe; and wort other fine colliflories (if I may so say) or tendrils, in Summer, in the fall of the leafe; and after them, in winter: and then a second spring of the foresaid *Cymæ* or tops against the Spring following, as the yeare before; so as there is no hearb in that regard, so fruitfull, vntill in the end her owne fertility is her death; for in this manner of bearing she spends her heart, her selfe and all. There is a third top-spring also at mid-summer to be set in summer time; but in case it be ouer-drie, any thing moist) affoordeth yong plants to be set in summer time; but in case it be ouer-drie, against Autumne. If there be want of moisture and skant of muck, the better taste Coleworts haue: if there be plenty and to spare of both, the more fruitfull and ranke they are. The onely muck & that which agreeth best with Coleworts or Cabbages, is Asles dung. I am content to stand the longer vpon this Garden-wort, because it is in so great request in the kitchen, and among our riotous gluttons. Would you haue speciall and principal Coleworts, both for sweet tast and also for great and faire cabbage: first and foremost, let the seed be sowne in a ground thoroughly digged more than once or twice, and wel manured; secondly, see you cut off the tender springs and yong stalkes that seem to put out far from the ground; or such as you perceiue mounting too ranke and ouer-high from the earth: thirdly, be sure to raise other mould in manner of a bank vp to them, so as there peep no more without the ground, than the very top: these kind of Coleworts be fitly called *Tritiana*, for the threefold hand and trauell about them; but surely the gaine will pay double for all the cost and toile both. Many more kindes there be of them, to wit, that of *Cumes*, which beareth leaues spreading flat along the ground, and opening in the head. Those of *Aricia*, be for heighth no taller than they, but rather more in number than for substance thinner and smaller: this kind is taken for the best and most gainfull, because vnto euery main leafe in manner, it putteth forth other yong tendrils or buds by themselves, which are good to be eaten. The Colewort Pompeianum (so called of the towne Pompeij) is taller than the rest, rising vp with a smal stem from the root; howbeit among the leaues it groweth to more thicknesse. These leaues branch out but here and there, and are in comparison of others narrower; howbeit much set by for their speciall tenderneffe, whereby they are soon sodden and dressed; and yet cold weather they cannot indure; whereas on the other side, the Coleworts of *Bruzze* or *Calabria*, like the best in winter, and be nourished with the hard season: leaues they haue exceeding great and large, but their stalks are but small; and as for tast, they be sharp and fower. The *Sabellian* Coles, what curled and ruffed leaues they carry, it is a wonder to see: so thick they are besides, that they rob the very stem of their nutriment, which thereby is the smaller: howbeit of al others they be reputed the sweetest. Long it is not since there came from out of the vale of *Aricia* (where somtimes there was a lake, and a tower standing vpon it, remaining yet at this day to be seene) a kind of Cabbage-cole, with a mightie great head and an infinite number of leaues, which gather and close round together, and these Coles we in Latin call *Lan-curres*, of the place from whence they come. Some Coleworts there be, which stretch out in-curres, of the place from whence they come. Some Coleworts there be, which stretch out in-curres, to a roundle; others againe extend in breadth, and be very full of fleshy brawns. None, cabbage, more than these, setting aside the *Tritian* Coleworts before named; that are known otherwile to bear a head a foot thick, and yet none putteth forth their *Cymes* or tender buds more than they. Moreover, this would be noted, That howfoeuer all kinds of Coleworts eat much sweeter for being bitten with the frost, yet if there be not good heed taken in cutting off their head or tender crops and buds, so that the wound come not neere the heart and pith, (and namely, by cutting them aslope and byas in manner of a Goats foot) they will take much harme thereby. Such

A Such as be referred to beare seed, ought not to be cut at all. They also are not without their grace and commendation, which neuer passe the bignesse of a green and ordinary plant, & such small coles are called *Halmyridia*, for that they grow not elsewhere but vpon the sea coasts: and because they will keep greene, prouision is made of such for to serue in long voiaiges at sea: for so soon as they be cut vp, before they touch the ground, they be put vp into barrels where lately oile hath been, and those newly dried against the time, and stopped vp close that no aire at all may enter in, and therein be they preferred. Some there be, who in removing the yong plants, lay vnder their roots, Rick and Sea-weeds, or els bruised and powdered nitre; as much as a man may take vp with three fingers, imagining thereby that they will the sooner come to maturity. Others againe take the seed of *Trifolie* and Nitre stamped together, which they strew vpon the leaues for the same purpose. [And as for Nitre, it is of this nature, to make them look greene still although they were sodden:] or els they vse to boile them after *Apicius* his fashion, namely, to steep them wel in oile and salt mingled together, before they be set vpon the fire for to be sodden.

B Moreover, there is a way to graffe herbs also as well as trees, namely, by cutting off the yong sions that spring out of the stalk, and therein to inoculate as it were the seed of another plant, within the pith or marow thereof. This also may be practised vpon wild Cucumbers.ouer and besides, there is a kind of wild Woorts growing in the fields, called *Lapfana*, much named and renowned by occasion of the sonets & carols chanted in the solemnities of *Iulius Caesar* the Emperours triumph, and especially of the merry rimes and licentious broad yeasts tossed by his soldiers, who at euery second verse cast in his teeth, that in *Dynrhachium* they liued of nothing els but of those Woorts: noting indeed by way of cauill and reproch, his nigardise in rewarding them so sleightly for their good seruice: now was this *Lapfana* a kind of wild Colewort, which they did eat of instead of the fine and dainty tendrils and buds of the garden Coles.

C As touching *Sperages*, there is not an herb in the garden, whereof there is so great regard and care taken, as of them. Concerning their first original & beginning, I haue spoken at large in the treatise, Of the maner how to order the *wild of that kind, and to entertain them in our gardens: as also how *Cato* willed vs to sow and plant them in plots of Reeds and Canes. Now there is a middle sort of these *Sperages*, not so ciuill and gentle as the *Asparagi* of the garden, and yet more kind and mild than the *Corradæ* of the field: these grow euery where abroad vpon the mountains; and the champion countrey of high *A' main* is ouerspred and full of them: whereof there goes a pleasant speech and merry conceit of *Tyberius Caesar* the Emperour, namely, that there grew an herb in *Almain* very like to the garden *Sperage*: for as touching that which commeth vp of it selfe in *Nefis*, an Island of *Campaîne*, it is thought the best simply of all others, without comparifon. The garden *Sperages* be planted from the knots bunching together within the ground, named *Spongia*, which easily may be replanted; for surely an hearb it is that carrieth a mighty head or cluster as it were of roots, and the same putteth forth spurns euery way from it of a great depth into the ground. They send out at first certaine greene spurts or buds peeping forth of the ground, which growing to a stem in processe of time rise sharpe in the top, and then are they chamfered & diuided into certaine musculous branches that spread abroad. This hearbe may be sowne also of seed. *Cato* tooke not more paines about any other hearbe, nor imploied greater diligence in the description thereof, than he did in it. It is the very last thing that he treateth of in his booke, whereby it may appeare, that the man came all vpon a sudden and newly to the knowledge of that hearbe, and the ordering of it. He giueth order, *Imprimis*, That the plot wherein they are to sowne, be moist, fat, and well digged. *Item*, That they be set half a foot euery way asunder one from another, & in no wise the place troden down with ones foot; moreover, that two or three seeds be put together in a hole, made before with a dibble directly by a line: for in those daies they set them onely of seed. *Item*, That this would be done about mid-March, which is the proper season therefore. *Item*, That they haue their fill of dung; That they be kept cleane with often weeding: but in any case, That great heed be taken in plucking vp the weeds, that the tender buds or croppes new knit and appearing aboue ground, be not knapt off. For the first yeare, hee would haue them in winter time to be covered with straw and litter, and so defended against the frost and cold weather: also during the spring ensuing, to be opened at the root, farced and well weeded. In the third yeare, by his rule, they ought to be burned in the spring time; and the sooner that the ground is thus burned, the better

D z

will

will they come vp againe and in greater plenty: which is the cause, that they like and prosper best in plots set with Canes and Reeds: for such desire to be burnt betimes in the yere. Moreover, he giueth another precept, that they must not be farled, nor haue the earth opened & laid hollow about them, before their buds or tops be about ground to be seen, for feare least in the farling, the roots take harm thereby, either by raising or shaking them vntill they be loose. From which time forward, if a man would gather any of the said buds or yong springs, for salad or other vse, they ought to be plucked and slipped from the roots; for otherwise, if they be broken and knapt off in the mids, the root will presently put forth many vnprofitable sprouts, which will suck away all the heart and kill it in the end. Silue and pluck it you may in manner aforesaid, vntill it spinde and run to feed, which commonly beginneth to be ripe in the Spring, & then it must be set on fire, as is before said: and then once againe, so soon as new buds and tendrons appeare about ground from the root, they must be farled, bared, and dunged afresh. Now after it hath grown in this manner nine yerres, so as by this time it is waxen old, the roots must be taken vp, and then replanted againe in a piece of ground well digged and as thoroughly dunged. Then (I say) ought the smal roots called Spongie in Latine, to be set againe, a foot distant one from another. Furthermore, *Cato* ordaineth expressly by name, That sheeps dung should be vsed for that purpose, because any other would breed store of weeds. And verily there was neuer knowne any other thing practised or assayed afterwards, to more gain and benefit about this Garden-herb, vnlesse it were this. That about the Ides or mids of February, some haue let the seeds of Speragie lie well soked in dung, and then sowed the same by heaps in little trenches or holes made for the purpose: after which, when the roots are wouen and knit one within another into a knot, the spurns shooting from them they plant after the *Æquinox* in Autumne following, a foot asunder: by which means they wil continue bearing plenteously for ten yerres together. For to breed and maintaine these garden Sperages, there is no better soile than the gardens of Rauenna, from whence we haue the fairest of all other. As for the herb named in Latine *Corruda*, I haue written heretofore of it: and I vnderstand thereby, the wild Sperage, which the Greekes call *Orminum* and *Myacanthion*: howbeit there be, who giue it other names. Finally, I reade of certaine Sperages which will engender and grow of Rams hornes beaten or stamped, and then put into the ground.

A man would thinke that I had discoursed already of all such Garden herbes as were of any price and regard: but that there remaineth one thing yet behind, whereof the greatest gaine of all other is raised, and yet me thinks I cannot write thereof, but be abashed to range it amongst the good herbes of the garden; and that forsooth is our Thistle: howbeit this is certaine (to the shame be it spoken of our wanton and wasting gluttons) that the Thistles about Carthage the great, & Corduba especially, cost vs ordinarily six thousand thousand Sesterces, to speak within compasse. See how vaine and prodigal we be, to bring into our kitchen and serue vp at our table, the monstrousities of other nations, and cannot forbear so much as these Thistles, which the very asses and other fourfooted beasts, haue wit enough to auoid & refuse for pricking their lips and muzzles. Well, since they be grown into so great request, I must not ouer-passe the gardening to them belonging, and namely, how they be ordered two maner of waies, to wit, replanted of yong sets or roots in Autumne, and sowed of seed before the nones of March. As for the plants before said, they ought to be slipped from it, and set before the Ides or mids of Nouember in any hand; or els if the ground be cold, we must stay vntill February, and then be doing with them about the rising of the Western wind *Faunonius*. Manured ywis it ought to be & dunged, (I would not els) so faire and goodly an herbe it is; and so forsooth (and it please you) they prosper the better and come on trimly. They are condite also and preserued in vineger (or els all were mard) in delicate life honey, seasoned also and bespiced (I may say to you) with the costly root of the plant *Laserwort*, yea and with *Cumin*; because wee would not be a day without Thistles, but haue them as an ordinary dish all the yeare long.

As for the rest of Garden-herbs behind, they need no long discourse, but a light running ouer them may serue well enough. First and foremost men say, That the best sowing of Basil, is at the feast * *Pasilia*: but some are of mind, that Autumne is as good: and they that would haue it done in winter, giue order to infuse and soke the seed first in vineger. Rocket also and garden Cresses, are not dainty to grow, but be it winter or Summer, they will soon come vp & prosper at all times. But Rocket of the twain, stands more at defiance with winter, and scorns at his frowning

This is meant
of Artichokes.

* i. Cal. May,
22 of April.

A ning looks and cold weather; as being of a contrary nature to *Leauce*, for it stirreth vp fleshy lust: and therefore commonly it is ioined with *Leauce* in sallads, & both are eaten together; that the exceeding heat of the one mixt with the extreme coldnes of the other, might make a good marriage and temperatire. Cresses tooke the name in Latine * *Nasturtium*, a *narium tormento*, as a man would say, Note-wring, because it will make onewith and shrink vp his nostrils: which is the reason, that the word is grown into a prouerb, when we would signifie a thing which will put life into one that is dull and vnlusty. In Arabia, the Cresses (by report) proue to a wonderful bignes. Rue also is sowed vsually in February when the Western wind *Faunonius* bloweth, and soon after the *Æquinox* in Autumne. It cannot away with winter, for it brooketh not cold or rain, nor moist ground, neither will it abide muck: it liketh well to grow in dry places, and such as lie faire vpon the Sun-shine; but a clay ground which is good for bricke and tile, that is alone for it and best of all other: it delighteth in ashes, and therewith is it fed and nourished; infomuch as they vse to blend ashes & the seed together, for to keep away the canker worm and such like. Certes we find, that in old time Rue was in some great account, and especiall reckoning about other herbes: for I reade in ancient Histories, That *Cornelius Cethegus*, at what time as he was chosen Consul with *Quintus Flaminius*, presently vpon the late election gaue a largesse to the people of new wine aromatized with Rue. The fig-tree and Rue are in a great league & amitie; infomuch as this herbe, sow and set it when and where you will, in no place prospereth better than vnder that tree: for planted it may be of a slip or sprig. Now if the same be put into a bean which hath a hole pierced or bored through, it will do far better, by reason that the bean clasping the set close, and vniting thereunto her own sap and moisture, cherisheth it therewith and makes it come apace: moreover, it will propagat and set it owne selfe, for let the top of any of her branches be bent downward, so as it may but touch the ground, it will presently take root. Of the same nature it is, that Basil, but that Rue is somewhat later ere it come vp, & groweth not so fast. When Rue is come to be of any strength, there is vntoward farling and weeding of it; for if it be handled, it will raise blisters vpon a mans fingers, vnlesse the hands be well gloued, or defended with oile. The leaues also of Rue are kept and preserued, being made vp into little knitches or bunches.

Now as touching Ach or Parsley, the manner is to sow it immediatly after the spring *Equinox* in March, but the seed would be first brused & beaten a little in a mortar: for some are persuaded, that by this means it groweth thicker and more crispe or curled: which it will doe likewise, in case after a bed be sowed therewith, it be troden vpon with mens feet, or beaten downe with a roller or cylinder. This peculiar property hath Parsley, that it will change the colour. It was an ancient custome in *Achaia*, to do honour vnto this herbe, by crowning those that went away with victory and wan the prize in the solemne tournays and sacred games *Nemei*, with a chaplet of Parsley. As for Mint, men vse to set it at the same time, of a young plant, so soone as they see it is spurt and come vp: but if it haue not sprung, yet they let not to plant the spurns of the root, knotted into an head within the ground in manner of the Spongie in Sperage before said. This herb taketh no great ioy in moist grounds. All Summer it looketh greene and fresh, but in winter it hath a hempen hew. A wild kind there is of Mint, named in Latine *Mentastrium*, which will increase by propagation or couching in the ground, as well as vine branches, and so willing it is to take, that it makes no matter which end of a slip be set downward; for at the wrong end it wil come as well as at the other. Mint in the Greeke tongue hath changed the old name, by occasion of the sweet * *smell* that it carieth, whereas before time it was called *Mintha*, whereof we in Latine deriued our name *Mentha*. A pleasant herb this is, and delectable to smell vnto, infomuch as you shal not see a husbandmans boud in the country, but all the meats from one end to the other be seasoned with mints. If it be once set or sown, & haue taken to a ground, it will continue there a long time. It resembleth much the herb *Peny-roiall*, the nature whereof (as I haue often shewed) is to blow her floures againe (vpon the shortest day of the yere) euen as it hangeth prickt vpon flesh in the butchery. Much after one sort are kept and preserued for sauce (as if they were of the same kind) Mint, *Peny-roiall*, and *Nep*: but aboue all, to a weake and peeuish stomach, *Cumin* agreeth most and is the best to get an appetite. It hath a qualitie to grow with root very eh, and fearfully taketh any hold of the earth, couering to be aloft. In hot grounds and such especially as be rotten & mellow, it would be sown in the mids of the spring. There is a second sort thereof growing wild, which some call *Cumin Rustick*, others *Thebaick*, which

ting.

which being bruised or beaten into powder, and drunk in water, is singular good for the pain of the stomach. The best Cumin in our part of the world, which is Europe, cometh from Carpetania; for otherwise the greatest name goeth of that in Æthiopia and Africk. And yet some here be who prefer the Cumin of Egypt before all.

* A corrupt word from *O-lus atrum*: as if one would say, *O-lus atrum*. Some take this for *L. ouach*. * *Iuxta macerian*, whereupon some Apothecaries name it *Macerianum*.

But * *Alifanders*, which some Greekes call *Hippocelium*, others *Smyrneum*, is of a strange and wonderfull nature about all other herbes: for it will grow of the very liquor or juice issuing forth of the stalk. It may be set also of a root: and indeed, they that gather the foresaid juice, vse to say, that it hath the very tast and relish of Myrrhe: & by *Theophrastus* his saying, it came first of Myrrh set into the ground. The old writers ordained, that *Alifanders* should be set or sowed in stony grounds, without tending or looking to, neer to some * mud wall. But now in our daies it is planted in places digged & delued ouer, once or twice: yea, and at any time from the blowing of the western wind *Fauonius* in Februarie, vntill the later *Æquinox* in September be past.

Capers likewise are set & sowed in dry places specially: but the bed must be digged in some low ground and laid hollow, inuironed round about with banks, and those raised with a ground-fell of stone worke, otherwise it would be ranging abroad and ouerspread whole fields, & make the ground barren and vnfruitfull. It flourisheth in Summer, and continueth green vntill the occultation or setting of the Brood-hen star *Virgilæ*; and sandy ground is most familiar and agreeable to it. Touching the defects and imperfections of that kinde which groweth beyond sea, I haue said enough among the shrubs and plants that be strangers.

The Caraway also is a stranger, as may appeare by the name of *Caria*, the native country thereof; it beareth one of the principal feeds that cometh into the kitchen. It careth not much where it is sown or planted, for it will grow in any ground, as well as the *Alifanders* beforenamed: howbeit, the best cometh out of *Caria*, the next to it in goodnes, we haue from *Phrygia*.

As for *Loueach* or *Liuih*, it is by nature wild and sauage, and loueth alone to grow of it self among the mountains of *Liguria*, whereof it cometh to haue the name *Ligusticum*, as being the naturall place best agreeing to the nature of it. Set or sowed it may be in any place where-soeuer: howbeit, this that is thus ordred by mans hand hath not the like vertue as the other, although it be in tast more pleasant, & some call it *Panax* or *Panace*: howbeit, *Creticus* a Greeke writer, calleth the wild *Origan* or *Cunila* *Bubula*, by that name. But all others in manner, attribute the name of *Conyza* or *Conyzoides* to *Cunilago*, *Fleabane* *Mullet*: and of *Thymbra*, *winter Sauory*, to *Cunila*, *garden Sauory*, which among vs hath another name in Latin, to wit, *K Satureia*, much vsed in sauces and seasoning of our meats.

This *Sauory* is commonly sown in the month of February, and hath no smal resemblance of *Origan*, in so much, as they are neuer both vsed at once in sauce or fallads, their vertues & operations be so like. And yet the Egyptian *Origanum* is preferred before the said *Sauory*.

To come now to *Lepidium*, *Dittander* or *Pepperwort*, it was sometime a stranger also with vs here in Italy. It is vsually sown after mid-February when the Western wind *Fauonius* hath plaid his part: afterwards when it hath put forth branches, it is cut downe close to the ground, and then it is laid bare and farcled, & the superfluous roots cut away, & so in the end cherished with muck. Thus must it be serued the two first yeres. For afterwards they vse the same in branches at all times, if the cruell and bitter winter kill them not; for surely this herb is most impatient of cold. It groweth a good cubit in heighth, bearing leaues like to *Lawrel*; & the same soft and tender. But neuer is it vsed in meat without milke.

Now for *Gith* or *Nigella Romana*, as it is an herb that groweth for the pastrie, to fit the Bakers hand; so *Annise* and *Dill* are as appropriat to the kitchen for Cooks, as the Apothecaries shop for the Physician.

Sacopenium likewise is an herb growing verily in gardens, but is vsed in Physicke onely. Certain herbes there be that accompany others for good fellowship, and grow with them, as namely *Poppy*; for commonly sowne it is with *Coleworts*, *Purcellane*, *Rocket*, and *Lectuce*.

Of garden *Poppies* there be three kinds, first the white: whereof the * seeds in old time being made into *Biskets* or *Comfits* with hony, were serued vp as a banketting dish. The rustical peasants of the country were wont to guild or glaze (as it were) the vppermost crust of their loaves of bread with yolks of eggs, and then to bestrew it with *Poppy* seed, which would cleaue fast to it, hauing first vnderlaied the bottome crust with * *Ammi*, or *Annise* seed and *Gith*: & then they put them into the oven beeing thus seasoned, which gaue a commendable taste to their bread when

* This Yunket or conceit was called *coctum* by *Tertullian* and *Festus*.

A when it was baked. There is a second kinde of *Poppie* called *Blacke*: out of the heads or bolles whereof, a white juice or liquor issueth by way of incision, like milk, and many receiue & referue it carefully. The third kind, which the Greekes name * *Rhœas*, our countrymen in Latin call the wandering or wild *Poppie*. It cometh vp verily of the owne accord, but in corne fields among Barly especially, like vnto *Rocket*, a cubite high, with a red floure that soon wil shed and fall off, whereupon it tooke that name of *Rhœas* in Greeke. Touching other kinds of *Poppie* growing of themselves, I purpose to speake in the treatise of physicke and medicinable herbes. Mean while this cannot be forgotten, that *Poppies* haue alwaies, time out of mind, been highly regarded and honoured among the Romanes; witnesse *Tarquine* the Proud, the last king of Rome, who when his sonnes Embassadors were come to him for to vnderstand his aduise, how to compasse the seignorie ouer the *Gabians*, drew them into his garden, and there by circumstance of topping the heads of the highest *Poppies* there growing, without any answer parole, dispatched them away, sufficiently furnished by this demonstration, with a double design, euen to fetch off the greatest mens heads of the citie, the readiest means to effect his purpose.

Againe, there is another sort of hearbs, that loue for companie to be set or sowne together about the *Æquinox* in Autumne, namely, *Coriander*, *Dill*, *Orach*, *Mallows*, *Garden dockes* or *Patience*, *Cheruell* (which the Greekes call *Pæderos*) and *Senuie*, which is of a most biting and stinging tast, of a fierie effect, but nathelesse very good and wholesome for mans bodie: this hearb will come of it self without the hand of man, howbeit proue it will the better if the plant be removed and set elsewhere. And yet, sow a ground once withall, you shall hardly rid the place of it cleane: for the seed no sooner sheddeth vpon the ground, but a man shall see it greene about ground. It serues also to make a pretty dish of meat to be eaten, being boiled or stewed between two little dishes in some conuenient liquor, in such sort, as a man shal not feele it to bite at the tongues end, nor complaine of any eagernes that it hath. The leaues besides vse to be sodden like as other pot-herbes. Now there be of this *Senuie*, three kinds: the first beareth small and slender leaues, the second is leaved like *Rapes* or *Turneps*, the third resembleth *Rocket*. The best Mustard seed cometh out of *Ægypt*. The Athenians were wont to call it *Napy*, some *Thlaspi*, and others *Saurion*.

To conclude, as touching the running wild *Thyme*, and *Sisymbrium*, *Horfe-mint* or *Water-mint*, most hills are replenished and tapissed as it were therewith: and especially in *Thracia*, where a man shall see a mighty quantity of wild *Thyme* branches, which the mountain waters or land floods carrie away and bring it downe with their streame to riuers sides, and then folke plant them. Semblably, at *Sicyon* there grows great store, conueighed thither from the mountains neere adjoining: and lastly, at *Athens*, brought thither out of the hill *Hymettus*. In like manner also the foresaid *water-mint* cometh from the hills with a sudden dash of rain, and is replanted accordingly. It groweth rankest and prospereth best in the brinks and sides of pits or wells, also about fish-ponds and standing pooles.

CHAP. IX.

¶ Of Finkle or Fennell, and Hempe.

E I remaineth now among garden hearbes to speake of those that be of the *Ferule* kind, and namely of *Fennell* in particular, a hearb wherein Snakes and such serpents take exceeding great delight, as heretofore I haue declared: and which being dried, is singular good to commend many meats out of the kitchen into the hall.

There is a plant resembleth it much, named *Thapsia*, whereof because I haue already written among other foraine herbes, I will proceed forward to *Hemp*, which is so profitable and good for to make cordage. This plant must be sowed of seed after the western wind *Fauonius* bloweth in Februarie. The thicker that it groweth, the slenderer and finer it is. When the seed thereof is ripe, namely, after the *Æquinox* in Autumne, folke vse to rub it out and then drie it either in the Sunne, the wind, or smoke. But the stalke or stem of the *Hemp* it selfe, they pluck out of the ground after Vintage: and it is the husbandmans nightwork by candle light to pill and cleane it. The best *Hempe* cometh from *Alabanda*, especially for to make nets and toile, where bee three kinds thereof. That part of the *Hempe* which is next to the rind or pilling, as also to the inner part within is worst: the principal of it lieth in the middest, and called it is *Mesa*. Next to the

the Alabandian Hempe for goodnesse, is that of Mylasium. But if you goe to the talnesse, there is about Rosea in the Sabines cuntry, Hempe as high as trees.

As touching the 2 kinds of Ferula, I haue spoken of them in my discourse of forraign plants. the seed of Ferula or Fennell-geant, is counted good meat in Italie: for it is put vp in pots of earth well stopped, and will continue a whole yeare. And of 2 sorts is this preferred Compost, to wit, the stalks, and the Bunches whiles they be knit round and not broken & spread abroad. And as they cal these knobs which they doe condite and keep, Corymbi; so that Ferula, which is suffered to rise vp in stem for to beare such heads, they tearme Corymbias.

CHAP. X.

¶ The maladies incident to Garden hearbes, The remedies against Pismires, Canker-wormes, and Gnats.

THE hearbes of the garden be subject to diuerse accidents, and namely, diseases, as well as corne and other fruits of the earth. For not onely Basill by age degenerats from the owne nature into wild creeping Thyme, but Sisymbrium also into Calaminth. The seed of an old Cole-wort will bring forth Turneps: and contrariwise, sow the seed of an old Rape & Turnep you shall haue Coleworts come vp of it. Cumin, if it be not kept neat and trim with much cleansing, will begin to decay at one side of the stalk beneath, and dy. Now hath Cumin but one onely stalk, and a root bulbous in manner of an Onion, it groweth not but in a light and leane soile. Otherwise, the peculiar disease appropriat to Cumin, is a kind of skurf or scab. Also Basill, toward the rising of the Dog-star, waxeth wan and pale. And generally, there is not an hearb but will turne yellow, if a woman come neere vnto it whiles she hath her monthly sicknesse vpon her.

Moreouer, there be diuerse sorts of little beasts or vermine engendred in the garden among the good hearbes. And namely, vpon the Nauewes, you shall haue gnats or flies: in radish Roots cankerwormes, and other little grubs: likewise, in Lettuce and * beet leaues. And as for these Beetworts last named, you shall see them haunted with snails, as well naked as in shels. In Leeks moreouer or Porret there settle other speciall vermine that be noisome to them feuerally, but such are very soone caught by throwing vpon those hearbes a little dung, for it will they gather to shroud and hide themselves. Furthermore, *Sabynus Tyro* in his booke intituled * *Cepuricon* which he dedicated to *Mecenas*, writeth, That it is not good to touch with knife or hooke, Rue, Winter Sauerie, Mint, and Basill. The same Author also hath taught vs a remedy against Em-mets (that do not the least mischiefe to gardens, when they lie nor to haue water at command) and that is this, to take sea mud or oose and ashes together, to temper a mortar of them both, and therewith to stop their holes. But the most forcible and effectuall thing to kill them, is the hearb called Ruds or Turn-sol. Some are of opinion, that the onely meane to chase these ants away, is, with water wherein the powder of a semi-brick or halfe-baked tile is mingled. And particularly, for to preferue Nauewes, it is a singular medicine for them to haue Feni-greek sowed among, as also for Beets to do the like with Cich pease: for this deuise wil drine away the Cankerworm. But say, that this practise was forgotten, & that the foresaid hearbes be already come vp, what remedie then? Mary, euen to seeth Wormwood and Housleek (which the Latines call Sedum, the Greekes Aiezoon) and sprinkle the decoction or broth thereof among them. Now what manner of hearbe this Housleek is, I haue shewed you already. It is a common speech, that if a man take the seed of Beets and other pot-hearbes, and wet them in the iuice of Housleek, otherwise called Sea-green, those hearbes shall be secured against all these hurtfull creatures whatsoeuer. And generally, no Cankerwormes shall do harme to any herbage in the garden, if a man pitch vpon the pales about a garden the bones of a Mares head; but he must be sure it was of a Mare, for a horse head will not serue. It is a common saying also, that if a riuier Crab or Craifish be hung vp in the mids of a garden, it is singular for that purpose. Some there be who make no more but touch those plants which they would preferue from the said vermin, only with twigs of the Dogge berie tree, and they hold them warished and safe ynough. Gnats keep a foule stir in gardens where water runneth through especially, and wherein there be some small trees growing; but these are soone chased away by burning a little Galbanum.

CHAP.

CHAP. XI.

¶ What garden seeds be stronger, which be weaker than others. Also what plants prosper better with salt water.

NOW as touching the change and alteration in seeds, occasioned by age and long keeping: some there be that are firme and fast, which hold their owne wel, as namely, the seeds of Coriander, Beets, Leeks, garden Cresses, Sennie or Mustard seed, Rocket, Sauerie, and in one word, all such as be hot and bite at the tongues end. Contrariwise, of a weaker nature are the seeds of Orach, Basill, Gourds, and Cucumbers. Generally, all summer seeds last longer than winter: and the Chibbol seed least of any other will abide age. But take the strongest and hardiest that may be, you shall haue none good after foure yeares, I mean only for to sow. And yet I must needs say, that Sauerie seed wil remain in force aboute that time. Radishes, Beets, Rue, and Sauerie find much good by being watered with salt water; for to these especially it is hol-some physick against many infirmities: and besides, it is thought to giue them a pleasant and commendable tast, yea, and it causeth them to be more fruitful. As for all other hearbes, they find benefit rather by fresh water. And since we are light vpon the mention of waters, those are thought best for this purpose which are coldest and sweetest to be drunk. Standing waters out of some pond, such also as are conueyed into gardens by trenches and gutters, are not good for a garden, because they bring in with them the seeds of many a weed. But aboute all other, raine waters comming in white shoures from heauen, be they that nourish a garden best, for these shoures kill the vermin also which are breeding therein.

CHAP. XII.

¶ The manner of watering Gardens. What Herbs will proue the better by removing and replanting. Of the iuices and saours that garden Herbes affoord.

THE best time of the day to water gardens is morning & euening, to the end that the water should not be ouerheat with the Sunne. Basill only would be watered also at noon. And moreouer some think, that when it is new sown, it will make haste to come vp very speedily, if it be sprinkled at the first with hot water. Generally, all herbs proue better, and grow to be greater, when they be transplanted, but principally Leeks and Nauews: nay this removing and replanting of them is the proper cure of many forances, for from that time forward, subiect they will not be to those iniuries that vse to infect them; and namely Chibbols, Porret, or Leeks, Radish, Parsly, Lettuce, Rapes or Turneps, and Cucumbers. All herbs which by nature grow wild, lightly haue smaller leaues and slenderer stalks, in tast also they be more biting and cagre, than such of that kinde as grow in gardens: as wee may see in Sauerie, Origan, and Rue. Howbeit, of all others the wild Dock is better than the garden Sorrell, which the Latines call Rumex. This garden Sorrell or foure docke is the stoutest and hardiest of all that grow: for if the seed haue once taken in a place, it wil by folks saying continue euer there: neither can it be killed, do what you will to the earth, especially if it grow neere the water side. If it be vsed with meats, vnlesse it be taken with Prifane, or husked Barly alone, it giueth a more pleasant & commendable tast thereto, and besides maketh it lighter of digestion. The wild Dock or Sorrell is good in many medicines. But that you may know how diligent and curious men haue been to search into the secrets of euerie thing, I will tell you what I haue found contriued in certaine verses of a Poet: namely, That if a man take the round treddles of a goat, and make in euerie one of them a little hole, putting therein the seed either of Leeks, Rocket, Lettuce, Parsly, Endiue, or garden Cresses, and close them vp, and so put them into the ground, it is wonderfull how they will prosper, and what faire plants will come thereof.ouer and besides, this would be noted, that all herbs wil be drier and more keen than the tame of the same kind. For this place requireth, that I should set downe the difference also of their iuice and tastes which they yeeld, and rather indeed than of Apples and such like fruits of trees. The tast or smack of Sauerie, Origan, Cresses, and Sennie, is hot and biting: of Wormwood and Centaury, bitter: of Cucum-ber, Gourds, and Lettuce, waterish. Of Majoram it is sharp only: but of Parsly, Dill, and Fennell,

* For some
Philosophers
held opinion,
That the tast
of herbs con-
sisted of a Ter-

and figures:
which Plinie
thinketh ridi-
culous.

nell, sharpe, and yet odorant withall. Of all smacks, the salt tast only is not naturall. And yet otherwhiles a kinde of salt fetleth like dust, or in manner of roundles or circles of water vpon herbs: howbeit soon it passeth away, and continueth no longer than many such vanities * and foolish opinions in this world. As for Panax, it tasteth much like pepper: but Siliquastrum or Indish Pepper more than it, and therefore no maruel if it were called Piperitis. Libanotis smelleth like Frankincense: Myrrhis of Myrrh. As touching Panace, sufficient hath been spoken already. Libanotis commeth naturally of feed in rotten grounds, lean & subiect to dews: it hath a root like to Alifanders, differing little or nothing in smell from Frankincense. The vse of it after it be one yeare old is most wholsome for the stomacke. Some terme it by another name, Rosemary. Also Alifanders, named in Greeke Smyrneum, loueth to grow in the same places that Rosemary doth, and the root resembleth Myrrh in tast. Indish Pepper likewise delighteth to be sowed in the same manner. The rest differ from others both in smell and tast, as Dil. Finally, so great is the diuersitie and force in things, that not only one changeth the naturall taste of another, but also drowneth it altogether. With Parsly the Cooks know how to take away the fourenesse and bitteresse in many meats: with the same also our Vintners haue a cast for to rid wine of the strong smell that is offensiuē; but they let it hang in certain bags within the vessels.

Thus much may serue concerning garden herbs, such I mean onely as be vsed in the kitchen about meats. It remaineth now to speake of the chiefe work of Nature contained in them: for all this while we haue discoursed of their increase, and the gain that may come thereof: and indeed treated we haue summarily of some plants and in generall termes. But forasmuch as the true vertues and properties of each herb cannot thoroughly and perfectly be knowne, but by their operations in physick, I must needs conclude, that therein lieth a mighty piece of work, to find out that secret and diuine power, lying hidden and inclosed within: and such a piece of worke, as I wot not whether there can be found any greater. For mine own part, good reason I had, not to set down and anex these medicinable vertues to euery herb; which were to mingle Agriculture with Physicke, and Physicke with Cookerie, and so to make a mish-mash and confusion of all things. For this I wist full well, that some men were desirous only to know what effects they had in curing maladies, as a study pertinent to their profession; who no doubt should haue lost a great deale of time before they had come to that which they looked for in running thorough the discourses of both the other, in case wee had handled altogether. But now, seeing euery thing is digested & ranged in their feuerall ranks, as well pertaining to the fields, as the kitchen, and the Apothecaries shop; an easie matter it will be for them that are willing and so disposed, to sort out each thing, and fit himselfe to his owne purpose, yea, and ioine them all at his pleasure.

THE

A

THE TWENTIETH BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proeme.

SINCE we are come thus far, as to treat of the greatest and principall work of Nature, we will begin from hence forward at the very meats which men put into their mouthes, and conuey into their stomacks, and urge them to confesse a truth, That hitherto they haue not well knowne those ordinarie means whereby they liue. And let no man in the mean time thinke this to be a simple or small piece of knowledge and learning, going by the base title & bare name that it carries; for so he may be soon deccied. For in the pursuit and discourse of this argument we shall take occasion to enter into a large field as touching the peace and war in Nature; we shall handle (I say) a deep secret, euen the naturall hatred and enmitie of dumbe, deafe, and senselesse creatures. And verily, the main point of this th came, and which may rauish vs to a greater wonder & admiration of the thing, lieth herin, That this mutual affection, which the Greeks call *sympathia*, whereupon the frame of this world dependeth, and whereby the course of all things doth stand, tendereth to the vse and benefit of man alone. For to what end else is it, that the element of Water quencheth fire? For what purpose doth the Sun suck and drink up the water, as it were to coole his heat and allay his thirst? and the Moon contrariwise breed humors, and engender moist vapors? and both Planets eclipse and abridge the light one of the other? But to leaue the heauen and those celestiall Bodies in their maiestie. What is the cause, that as the Magnet or loadstone draweth iron vnto it: so there is another * stone abhorreth the same, and driueth iron from it? What should the reason be of the Diamond, that peerlesse stone, the chiefe iewel wherein our rich worldlings repose their greatest ioy and delight, a stone otherwise * inuincible, and which no force and violence besides can conquer, but that it remaineth still insfrangible; and yet that the simple blood of a poore Goat is able to burst it in pieces? Besides many other secrets in nature, as strange, yea and more miraculous. All which we purpose to reserve vnto their seuerall places, and will speake of them in order. Meane while may it please the Reader to pardon vs, and to take in good part the manner of our entrance into this matter: for albeit we shall deale in the beginning with the smallest and basest things of all others, yet such they be as are wholsome, and concerne much the health of man and the maintenance of his life. And first will we set in hand with the garden, and the herbes that wee finde there.

CHAP. I.

Of the wilde Cucumber, and the iuice thereof, Elaterium.

THIS wild Cucumber, as we haue said heretofore, is far lesse than that of the Garden. Out of the * fruit hereof there is a medicinable iuice drawne, which the Physitians call Elaterium. For to get this iuice, men must not stay vntill the * Cucumber be fully ripe: for vnles it be taken betimes and cut down the sooner, it wil leap & flurt in the handling from the stele whereto it hangeth, against their faces, with no smal danger of their eye-sight. Now when it is once gathered, they keepe it so one whole night. The next morrow they make an incision and slit it with the edge of a cane. They vse to strew ashes also thereupon, to restrain and keep down the liquor which

* Theamedes, cap. 16. lib. 16.

* Whereupon it is called *Adamm*.

* Semen pui siu cu anisue.

* Whereupon it is called *Tough me not*.

which issueth forth in such abundance: which done, they presse the said juice forth, and receiue it in raine water, wherein it ferleth: and afterwards, when it is dried in the Sunne, they make it vp into Trochisques. And certaine these Trochisques are soueraigne for many purposes, to the great good and benefit of mankind: For first and foremost, it cureth the dimnesse and other defects or imperfections of the eyes: it healeth also the vlcers of the eye lids. It is said moreover, that if a man rub neuer so little of this juice vpon vine roots, there will no birds come neere to pecke or once touch the grapes that shall hang thereon.

The root of this wild Cucumber, if it be boiled in vinegre and made into a liniment, and so applied, is singular good for all kinds of gout; but the juice of the said root helpeth the tooth-ach. The root being dried and incorporat with rosin, cureth the ringworme, tetter, & wild scab or skurf, which some call Psora and Lichenes: it discuffeth and healeth the swelling kernels behind the eare; the angrie pushes also and biles in other Emunctories called Pani: and reduceth the stools or skars left after any sore, and other skarres, to their fresh and natie colour againe. The juice of the leaues dopped with vinegre into the eares, is a remedie for deafenesse. As for the liquor concrete of this cucumber, named elaterium, the right season of making it, is in autumn: neither is there a drug that the Apothecaries hath, which lasteth longer than it doth: howbeit, before it be three yerres old, it begins not to be in force for any purpose that a man shall vse it: and yet if one would occupie it fresh and new before that time, he must correct the foresaid Troch with vinegre, dissoluing them therein ouer a soft fire, in a new earthen pot neuer occupied before: but the elder they be, the better and more effectual they are; in so much as (by the report of *Theophrastus*) Elaterium hath bin kept and continued good 200 yerres. And for fiftie yerres, it is so strong & full of vertue, that it wil put out the light of a candle or lamp: for this is the triall and prooffe of good Elaterium, it being set neer thereto, before that it puts out the light, it cause the candle to sparkle vpward and downward. That which is pale of color and smooth, is better than that which is of a greenish grasse color, & rough in hand; the same also is somewhat bitter withall. Moreover, it is said, that if a woman desire to haue children, & do cary about her the fruit of this wild Cucumber fast tied to her bodie, she shall the sooner conceiue and proue with child; prouided alwaies that in the gathering, the said Cucumber touched not the ground in any case. Also if it be lapped within the wooll of a Ram, & be bound to the loins of a woman in trauell of childbirth, so that she be not her selfware therof, she shall haue the better speed and easier deliuerance: but then, so soon as the infant & the mother be parted, the said Cucumber must be had out of the house in all hast, where the woman lieth. Those writers who magnifie these wild Cucumbers, and set great store by them, affirm, That the best kind of them groweth in Arabia; and the next about Cyrenæ: but others say, That the principall be in Arcadia; That the plant resemblith Turnsol; That betwene the leaues and branches thereof there groweth the fruit, as big as a Wallnut, with a white taile turning vp backward in manner of a Scorpions taile: whereupon some there bee, who giue it the name of the Scorpion Cucumber. True it is indeed, that as wel the fruit it selfe as the juice therof called Elaterium be most effectual against the pricke or sting of the Scorpion, as also that it is a medicine purgatiue of the bellie; but especially cleaseth the wombe or matrice of women. The ordinarie dose is from half an Obulus to a Solid [i. an obole or half a scruple] according to the strength of the patient. A greater receipt than one Obulus, killeth him or her that taketh it: but being taken within that quantitie aboue named, in some broth or conuenient liquor, it is passing good for the dropfie, yea, and to euacuat those filthie humors that engender the lowfe diseaf. Being tempered with honey and old oile, and so reduced into a thin ointment or liniment, it cureth the Squinancie, and such diseases incident to the windpipes.

CHAP. II.

¶ Of the Serpentine Cucumber, called otherwise the Wandering Cucumber: also of the Garden Cucumbers, Melons or Pompions.

Many there be of opinion, that the Serpentine Cucumber among vs, which others call the wandering Cucumber, is the same that the former Cucumber which yeeldeth Elaterium. The decoction whereof is of that vertue, that whatsoever is besprinkled therewith, no myce wil come neer to touch it. The same being sodden in vinegre and brought to the consistence

A consistence of an ointment, is a present remedie to allay the pains of gout, as wel in feet, hands, knees and armes, as in any other joint whatsoeuer. Also, if the seed thereof, or the fruit alone, dried in the Sun and beaten to powder, be drunke to the weight of 30 deniers (Romane) in one hemine or wine pint of water, it assuageth the pain of the reines and the loins. Tempered with womans milke, it resolueth all sodain tumors & swellings, being applied to the grieved place. But to come againe to Elaterium, it mundifieth the matrice and naturall parts of women; but if they be with child, they must take heed how they meddle with it, for it bringeth them to a shift, yea and hastneth abortiue or vntimely birth. Good it is for al them that be short winded. As for the yellow iaudise, it cureth it, if it be but snuffed vp into the nose. Anoint or bath the face with it in the Sun, it taketh away pimples & other spots there. Many attribute al the same properties and effects to the Garden cucumbers: And in very deed, this fruit would not be despised, in regard of the use thereof in Physicke: for first and foremost, Take Cucumber seeds as many as three fingers will receiue, stampe them with Cumin, and giue the powder in wine to them that haue the cough, for to drinke, you shall see present helpe. The same seeds taken in powder with breast-milke, cureth those that be lunaticke and phranticke. Also, the weight of one * Acetabulum, [i. much about two ounces] cureth them that haue the Dysentery or bloody flux. Moreover, being taken with a like poise or quantity of Cumin seed in mead or honyed water, it is singular good for them that reach vp filthy matter from their lungs; as also for those who haue * weake and diseased liuers. If one drinke the same with some sweet wine, it prouokes vrine: and being injected by a Clystire together with Cumin, it caseth the paine in the kidnies and reines.

C As for the fruit called Pompions or Melons, being eaten as meat, they cool the body mightily and make it soluble. The fleshy substance of them applied to the eyes, assuageth their pain and restraineth their waterish and rheumatick flux. Their root healeth the * wens or vlcers gathered in manner of hony-combs: which swellings some call Cerio. Being dried, it staieth vomits, so it be brought into powder and giuen to the weight of * foure Oboli in honyed water: but the Patient when he hath drunke it, must walke presently vp on it half a mile. The same powder is deterfiue and scouring, and therefore put into sope and washing-balls. As for the rind or barke thereof, it procureth vomit indeed, but it cleaseth the skin as wel as the other. The same doe the leaues of any domesticall or garden Cucumbers or Melons, if they be made into a liniment. The said leaues also stamped with honey and brought to the forme of a cataplasme, cure the bloody, fals or night-blains, but tempered with wine, they heale the bitings of dogs, as also, of the Millepede, which the Greeks call Seps, a long worm with hairy feet, doing much harme to cattaille especially; for look where it biteth, the place presently swelleth and putrifieth. The very Cucumber it selfe is of a comfortable odor, and recouereth the faintings of the heart, and those that swoone. Finally, if you would make a delicate sallad of Cucumbers, boile them first then pill from them their rind, serue them vp with oile, vinegre, and honey: certain it is, they are by this meanes far sweeter and pleasanter than otherwise.

CHAP. III.

¶ Of the wild Gourd, and the Rape or Turnep,

T Here is a kind of wild * Gourd which the Greeks call Somphos, as one would say, hollow and emptie (for thereupon it tooke that name) a finger thicke, growing nowhere else but among rocks and stony grounds. If a man chew this Gourd and suck out the juice thereof he shall find it very comfortable to the stomach. There is another wild gourd called Colocynthis, but that is full within, and lesse than that of the Garden. The pale of this kind is the better, for such be vsed in Physicke: and yet that of grasse greene colour when it is dried, if it be taken alone, doth purge & euacuat the belly. Also being infused into the bodie by way of clystire, it cureth all diseases of the guts, flanks, reines, and loines: it helpeth the palfie likewise, or the resolution of the sinews. After the seeds be taken forth, some fill the place with honyed water, & so seeth all together, vntill half be consumed, and giue of this decoction the quantitie of foure Oboli, with good successe to those that be troubled with a cough: the powder therof dryd & incorporat with sodden hony & so reduced into pills and swallowed, is good for the stomach: the seeds be singular to cure the lamie; but the party must drinke honyed water presently after it.

* Adietivides;
* two scruples;

* This is not
Colocynthis.

The fleshe pulpe within mixed with wormwood and honey, takes away the tooth-ach & a colution made with the iuice thereof and vinegre hot, confirmeth and fasteneth the teeth that be loose in the head. Moreouer, if with it and oile together, one rub the backe bone, the loines and the haunches or huckle, it will immediatly rid them of their pain and ach. But I will tell you a strange and wonderfull effect indeed: If a man take their seeds of * euen number & hang them either about the necke or armes of them that haue the ague, they will driue the accesse or fit away; be it any of those intermittent feuers which the Greekes call Periodicall. Thus much for the wild Gourd, Colocynthis.

As for the domesticall Gourd of the Garden, after it is scraped and pilled, take the iuice thereof, and distill it warme into the eares, it will ease the paine. The inner flesh or pulp cleansed from the seed, is passing good for to be applied to the agnells or corns of the feet: also to be laid vnto those impostumes or swellings, that grow to an head or suppuration [which the Greekes call Apoftemata.] The liquor or decoction of the Gourd, foddenn al whole as it is, with rind, seed, and pulpe, doth strengthen the loose teeth, and stineth their ach. Wine wherein it is boiled, is a singular decoction to bath the eies, for to repress and stay the fluxe or theume that falleth vpon them. The leaues of it, together with the fresh leaues of the Cypresse tree newly gathered, being stamped and applied to wounds, be excellent to heal them. The Gourd it selfe enclosed within clay, and so baked or roasted vnder the embers, and then stamped and incorporate with goose grease, hath the like effect. Moreouer, the scrapings or shauings of the rind, mightily cooleth the heat of the gout, if it be not inueterat and old: the heats also of the head and especially the * burning therein, which troubleth little infants. The said parings being incorporate with the filth rubbed or curried from mens bodies in baines & stouues after they haue sweated, and so laid vpon any part that hath *S. Anthonies* fire, allaieth the heat and bringeth the place into temper: so doe the seeds also, vsed in like manner. The iuice or liquor drawne out of the said parings, being mingled with oile of roses and vinegre, and then made into a liniment, doth mitigate the extreme heat of burning feauers. The ashes of Gourd parings burnt & strewed drie vpon any part of the bodie that is burnt or skalded, healeth them wonderfully. *C. hyrsippus* the Physician condemned Gourds, and forbad men to eat of them. Howbeit, all Physicians doe resolutely agree in this, That they be passing good for the stomacke: as also for the exulcerations of the guts and bladder.

As for Rapes or Turneps, they likewise are medicinable, and haue their vse in Physick, for to begin withall, if one lay them very hot to kibe or humbled heeles, they wil cure them. Also, if the feet be frozen and benumbed with cold, lay them thereto foddenn in water, and this fomentation will restore them to their former heat. The hot decoction or broth of Rapes, is passing good for to bath the goutie members, yea if it were a cold gout. The Rape or Turnep root, raw as it grew, brayed in a mortar with salt, is a remedie for all diseases of the feet, bee they cornes, kibes, bloody falls, swellings of cold, or any other infirmities whatsoeuer. Rape seed bruised to a liniment drunken also with wine, is reported to be a soueraign medicine against the stinging of serpents, and any other poison: Howbeit many think, that it is a preseruatiue & countrepoyson, when it is taken in wine and oile. *Democritus* banished turneps altogether from the board, by reason of the ventosities or windinesse that it engender. But *Diocles* on the other side extolled and praised them as much, and affirmeth, That they will pricke forward to *Venus*. The like doth *Dionysius* report of them, and the rather (saith he) if they be condite with Rocket. He writeth moreouer, That if they be roasted or baked vnder the ashes, and so incorporate with grease, will make a notable good cataplasm for the gout and joynt-ach. The wild rape or turnep groweth commonly euery where among corne fields: it brancheth much, carieth a white seed, twise as big as that of the Poppie. This being incorporate with wine of equall quantity, is much vsed to take away riuils, and so smooth the skin both of the face and also of the whole body besides. To conclude, the roots of Eruiile, Barley, Wheat, and Lupines, be good for nothing at all.

CHAP. IIII.

¶ The diuers sorts of Nauues: of the wild Radish of the Garden Radish, and the Parsnep.

The Greek writers obserue two kinds of Nauues, which are good for Physick. The first ariseth vpon with * a cornered and edged stalk, beareth leaues r... Parsely, and putteth out floures

* It may be the meaneth a number respectiue to the type of the ague, that is to say, 3 in a tertian, 4 in a quartan, 5 in a quintan, &c.

* Scirius.

* *Angulifera caulibus, foliis pinnatis, flore albo.* Ex Dioscoride;

A floures like Dil: this they call Bunion: the decoction whereof being drunken with honied water, or with a dram weight of the owne iuyce, is counted soueraigne for the purgations that follow women for the defects of the bladder and vrine. The seed parched and beaten to powder, and so taken in a draught of hot water, to the quantitie of foure * cyathes, cureth the bloody flux: but it stoppeth vrine, vnlesse the patient drink Linefeed withall. The second kind is named Bunias, and resembleth both Rape and Radish: the seed of it is excellent good against poyson; and therefore in antidotes and preseruatiues it is much vsed. That there be Radishes wilde, we haue shewed heretofore. The most commended about all others is that which groweth in Arcadia: although there are of them in other countries, and those counted better, only for to prouoke vrine. Otherwise they purge choler, and namely their rindes infused in wine do the same.

Now ouer and besides their vertues and properties related heretofore, they discharge and cleanse the stomack, cut and extenuate flegme, and withall be diureticall and procure vrine.

There is a kind of garden Radish in Italy which they name *Armoracia*, vsed also in physick: the decoction whereof if a man take a draught of it in the morning, to the quantitie of a cyath, doth fret, break, and expell the stone by way of grauell. Boile the same in water and Vinegre, therewith bathe or anoint the place stung with any serpent, and it will heale it vp. Radish taken with hony in a morning next ones heart tasting, is good for the cough. The seed parched, and so chewed alone without any thing els, asswageth the pain of the smal guts, * in the flanks and hypocondriall parts. The decoction of Radish leaues foddenn in water and so drunk, or the very iuice of the root it selfe as much as two cyathes, is thought to be a singular medicine against the breeding of body-lice. Radishes stamped in a mortar, and brought into the forme of a liniment, are thought to be excellent good for hot inflammations: the rind also stamped together with hony, and laid to any bruised place that looketh black and blew after a fresh stripe, dissolueth that cluttered blood, and reduceth the former color. The chewing of the quickest & most biting Radishes keeps them awake that are giuen to ouermuch drowsinesse, & inclined to the lethargie. The seed parched and afterwards stamped and incorporate with hony, cureth them that take their wind short. The same is also held for a countrepoyson. A defensatiue also the Radish is against scorpions, and resisteth their poisoned sting: for let a man rub his hands well either with the iuyce of the root, or the seeds, he may handle scorpions safely. Do but lay a Radish vpon a scorpon he will presently die. Moreouer, *Nicander* affirmes, that Radishes be passing good for them that haue eaten either venomous Mushromes or Henbane. The two *Apollodores* prescribe Radish to be giuen to them who suspect themselves to be poysoned with the viscus gum of the white Chamæleon root called *Ixias*, but taken diuersly, for the one of them surnamed *Citicius*, giueth the seed stamped, and so to drink it in water: the other *Apollodorus*, of Tarentum, ordains the iuice of Radish for this effect and purpose. Moreouer, radishes are thought good to diminish and extenuate the swelling spleen: they are wholesome for the liuer, & mitigate the pain of the loins. Being taken with Vineger and Senvy, they helpe them that are in a drop-sie, or false into a lethargie. *Praxagoras* is of iudgement, That Radishes should be giuen for to eat, to them that are troubled with the black passion, to wit, the paine and ringing of the small guts. And *Plinios* appointeth them to be eaten of those that be troubled with a continuall flux, by reason of a feeble stomack, called thereupon *Cœliaci*. They heale the Dysenterie or exulceration of the guts: they euacuate also and rid away the filthy matter and corruption of impostumes gathered about the midriffe and principal parts, if they be eaten with honey. But some for this purpose would haue them luted or bedawbed with clay, and so roasted or baked them afterwards vnder the ashes; and being thus prepared, they are effectually to bring down womens termes. Being taken with vinegre and hony in maner of an oxymel, they chase worms out of the guts and belly. If they be foddenn to the thirds, and their decoction giuen to drink with wine, they do much good to them who haue a rupture, and their guts fallen downe into the burse of their cods: and in this wise they rid and scoure away the cluttered & offensive blood gathered in the guts and sent thither from any other part. *Medius* the physitian prescribeth them to be boiled and giuen to the same purpose; as also to those that spit and reach vp blood: yea and to women in childbed newly laid, for to increase their milk. *Hippocrates* counselleth women whose haire is giuen to shed much, for to rub their heads with radish roots: also to apply them bruised in manner of a cataplasm vnto the nauill, when they be tormented with the paines of the matrice. They will bring to the natie & liuely colour the parts that are cicatrized or newly skarred.

* Cyathis ten drams.

Eugenoporus

* *Illece, Her. 2 mol. fomerad illece, & them it significeth.* Parturice.

red. The seed bruised and tempered with water, and so laid as a cataplasme, stayeth the running of cancerous or eating vlcers, which the Greekes call Phagedæne. *Democritus* is of opinion, That much feeding vpon Radishes, stirreth vp lust and maketh folk amorous; which peradventure is the reason, that some haue thought they be hurtfull to the voice. The leaues of those radishes onely that haue the longer roots, are said to quicken the eye-sight: but if a man perceiue that he hath either inwardly taken for a medicine, or applied outwardly, a radish root which is ouer strong, he must presently haue Hyssope giuen him: for this Antipathy and natural contrarietie there is betwene these two hearbs, That the one correcteth the other. For them that be hard of hearing, Physicians vse to infill the iuice of the Radish by drop-meale into the eares. And for them that would perbreake or vomit, the best way to take it, is at the end of a meale with the last meat.

* *Summo cibo*, although *Dioclesides* saith *primo cibum* and himselfe in the former booke *teitani*.

As touching Hibiscum, like it is to the Parsnep: some call it Moloche Agria, others Pistolochia: it cureth the sores and vlcers that be in gristles, and knitteth broken bones. The leaues thereof drunke with water, loosen the belly, and chase away Serpents. Applied in a liniment or otherwise rubbed vpon a place stung with Bee, Waspe, or Hornet, they are a present remedie. The roots therof digged out of the ground before Sun-rising, & enfolded or wrapped in wooll as it grew vpon the sheepes backe, without any other artificiall colour, and namely of an ewe, which hath yeaned likewise an ewe lambe, is thought to be a singular thing for to be bound vnto the swelling kernels called the Kings euill, yea although they were exulcerat and ran. But some are of this mind, That for to doe this deed, it should be gotten vp with an instrument of gold; and great heed should be taken, that after it is once vp, it touch not the earth againe. Finally, *Celsus* giueth counsell, to lay the root thereof foddren in wine to the gouty joynts that are without tumor and shew no swelling.

CHAP. V.

¶ Of *Staphylinus*, or the Parsnep. Of *Cheruell*, the Skirwort: of *Seseli*, *Elecampane*, and Onions.

There is a second kind of Parsnep, named *Staphylinus*, which commonly men call the Wandering Parsnep. The seed bruised and drunke in wine, is singular good for them that haue swolne bellies, the rising or suffocation of the mother in women, with the torments and pains thereto incident, it cureth, in so much as it reduceth the matrice into the right place: being applied also as a liniment with wine cuit, it helps the wrings and throwes of their belly. It is not amisse also for men to take it, for the seed being stamped together with bread crums, of each a like portion, and so drunke with wine, cures the belly-ach with them also. It prouoketh vrine: and being applied fresh and new with honey, it represseth the spreading of fretting and running vlcers. The powder thereof also being drie and strewed thereupon, hath the like effect. *Diocles* aduiseeth to giue the root therof in honied water, against the infirmities of liuer, spleene, flanks, small guts, loines, and reins. *Cleophrastus* saith, that it wil helpe (in that manner taken) an old bloudie flux, which hath continued a long time. *Philistio* boileth the root in milke, and giueth 4 ounces thereof to them who are troubled with the strangury, or pisse by drop-meale: but with water, he giueth it for the droppe, to those also that with a cricke or cramp haue their necks drawne backward, for the pleurisie, and epilepsie or falling sickness. Moreouer, it is commonly said, that whosoever hath this root about them, are safe enough for being stung with any Serpent: nay if they doe but tast thereof before-hand, they shal take no harme if they be either bitten or stung by them: and say they be already stung, let them apply it to the wounded place with hogs grease; and it will heale it vp. The leaues chewed help the indigestion & cruditie of the stomacke. *Orpheus* said moreouer, That this root had an amatorious propertie to win loue, haply because much feeding therof (as it is well knowne) doth sollicit vnto the game of loue, and maketh folke amorous: which is the reason also that some haue put down in writing, That it will helpe women to conceiue. As for the Garden Parsneps they are in many other respects of great force and very powerfull; but the wild is more effectuell, and principally that which groweth in stonie grounds. The seed of the Garden Parsnep also, being drunke in wine, or vinegre and wine together, sauerth those that are stung with Scorpions. If a man pick his teeth and rub them all about with a Parsnep root, he shall be eased of his tooth-ach.

The

A The Syrians are great Gardeners, they take exceeding paines and be most curious in gardening, whereupon arose the Prouerbe in Greeke, to this effect, *Many Worts and Pot-bearbes in Syria*. They vse to plant in their gardens a certaine hearb very like to a Parsnep, which some call *Ginidum*, & Tooth-picke *Cheruell*: more slender and smaller it is only, and therewith bitterer in tast, but it worketh the like effects. They vse to eat it both foddren and raw, and find it agree well with the stomacke: for it drieth vp all the superfluous humours and excrements which be bedded and deeply rooted within it.

As for the wild Skirwort that grows wandering euery where, it is like both in shape and operation to those of the garden. It stirreth vp the appetite and skoureth the stomack of those crudities which caused dulnesse therein, and loathing to meat. *Opion* is verily persuaded, that if one eat it with vinegre aromatized with *Laserpitium*, or take it with pepper & honied wine: or else with the pickle of fish named *Garum*, it prouokes vrine, and putteth him or her in mind of loue delights. Of the same opinion also is *Diocles*. Furthermore, that it is a cordiall, and doth mightily corroborat and strengthen the heart, vpon the recouerie of a long and dangerous sickness; and is besides singular good to stay the stomacke after much casting and vomiting. *Heracides* was wont to giue Skirworts to them who had drunk Quick-silver: so much also as were but cold & could not sufficiently perform the duties of mariage: finally, to them that being newly crept out of their beds after some grievous disease, had need of restoratiues. *Hicetius* was of this mind and said, they were good for the stomacke, because no man could possibly eat 3 Skirwort roots together: and yet he thinks that they would agree very well with those weak persons who were

C lately sick and newly walking abroad, against they should fall to their old drinking of wine again. But to come more particularly to the garden Skirwort, if the iuice therof be drunke with Goats milke, it stayeth the flux of the belly called the Laske. And thus much for the Skirwort, named in Latin *Sifer*. But forasmuch as the proximitie and likenes in many Greek names many a time confounds the memorie and deceiues them, causing them to mistake one thing for another, I wil for vicinitie and neighborhood sake annex vnto *Sifer*, the hearb *Sifer* or *Seseli*; for me thinks they will doe very well to stand together: but this is an hearb very common and well known. The best is that which comes from *Marfeils*, & is therupon named *Seseli Massiliense*: it hath a broad flat seed and a yellow. A second kind thereof is named *Aethiopicum*, with a blacker seed: but the third which is brought from *Candie*, and therefore termed *Creticum*, is of

D all other most odoriferous & smells sweetest. The root of *Seseli* or *Sifer*, casts a pleasant sauer: and as men say, the Vultures also or Geirs feed on the seed. If a man or woman drinke it with whitewine, it cures an old cough; it knits those who are brused bellied, or haue ruptures; and lastly, helps them that be much troubled with cramps or convulsions. Also if it be taken to the weight or quantitie of two or three * *Ligules*, it cures those who haue their necks drawn backward to their shoulders with the Spasme; it corrects the defects and faults of the liuer, it allaieth the wrings and torments of the guts; and bringeth them to pisse with ease and freely who are afflicted with the Strangurie. The very leaues of *Sifer* are also medicinable, for they procure easy childbirth: yea and in that respect the very dumb four-footed beast findeth the benefit therof: and that know the Hinds well enough by a secret instinct of nature, who being near their time

F and readie to calue, feed vpon this hearbe most of all others. Good it is against *S. Antonies fire*, applied to the place in manner of a liniment. Certes, if a man eat either the leafe or the seed of *Sifer*, presently after meat, or at the latter end of repast, it helpeth digestion. It staies the gurrie or running out of the belly in 4 footed beasts, whether it be giuen stamped by way of a trench and so injected, or chewed drie among their salt meat. If kine or oxen be sicke, stampe it and pour it down their throats, or els clysterize them with it. As for *Elecampane*, if it be chewed vpon an emptie stomacke fasting, it confirms the loose teeth, so that it be taken as it was digged forth of the earth before it touch the ground againe. Being confectioned or condite, it cures the cough. The iuice of the root foddren, expells the broad wormes bred in the guts. The powder of it dried in the shadow helpeth the cough, the stitch and cramp, dissolueth windines & is good for * the accidents incident to the throat and windpipes. It is a souerain medicine against the * *Arteries* pricks or stings of venomous beasts. The leaues applied as a liniment, with wine, appease the extreame pain of the loins. As for Onions, I cannot find that there be any of them grow wild. Those which are sown in gardens, I am sure, wil with their smell only cause the eyes to shed tears, & by that means clarify the sight: but if they be anointed with the iuice, they will mundifie the bet-

* *Ligula* may be taken for a spoonfull, a three drams and a scruple, somewhat vnder halfe an ounce, as a good spoone will doe, with vs.

ter. It is said that they will procure sleepe, and heale the cankers or vlcers of the mouth, beeing chewed with bread. Also greene Onions applied with vinegre to the plaec bitten with a [mad] dog, or els drie, and laid to with Honey and Wine, to the plaister or cataplasme be not remoued, in three daies cureth the hurt without danger. In this maner also they wil heal * galled places. Being roasted vnder the ashes, many vse to apply them with Barly floure or meale, as a pulstesse or cataplasme to the eies that be waterie or rheumaticke, as also to the vlcers of the priuy parts. The imunction of the eies, with the iuice therof, is thought to cleanse their cicatrises or * cloudines of the eies called the pin and web: as also to cure the pearle there breeding: moreover, the blood (hotting or red streaks, in the white, and the white spots appearing in the blacke circle about the apple. Moreover, it cureth bitings & stings of serpents, yea, and heales al vlcers, being emplastred with honey. Also the exulcerations or impostumes within the ears, are by it & womens milke cured. And for to amend the ringing and vnkind sound and noise therein, & to recover those that be hard of hearing, many haue vsed to droppe the iuice of Onions together with Goose grease or els hony. Furthermore, they giue it to be drunke with water, to those that suddenly become speechlesse and dumb. A collution also made with Onions, helps the tooth-ach. And being laid vpon wounds, made either with prick or bite of any venomous beast, and especially of Scorpions, it is thought to be a soueraign salub. Many are wont (to very good effect) for to bruse Onions, and therewith to rub those parts that be troubled with a skurfe and running mange, as also to recover haire where it is shed and gon. Being boiled, they are giuen for to be eaten, vnto those who are diseased with the blodie Flix or pain of the reins & loins. Their outward pilings burnt into ashes & mingled with vinegre, cure the bitings and stings of serpents, if the place be bathed or anointed therewith, yea, and the very Onion it selfe being applied with vinegre, cures the sting of that shrewd worme Milliped. As for all other vertues and properties of Onions, the Physicians are wonderful contrary one to another in their writings: for our moderne and late writers do hold and to haue deliuered in their books, That onions are hurtful to the parts about the heart, & other vitall members: as also, that they hinder digestion, breeding wind and ventosities, and causing drought or thirstinesse. *Asclepiades* and his sect or followers, contrariwise affirme, That onions are so wholesome, that they will make them well colored who vse to feed vpon them: and more than so, they say that if one in health every day eat of them fasting, he shall be sure to continue healthful, strong, & lusty: that they be good for the stomack, in this regard, that they cause risting and breaking of wind vward, which is a good exercise of the stomack: and withall, that they keepe the bodie loofe and laxatiue, yea, and open the Hæmorrhoid veins if they be put vp in maner of suppositories. Also, that the iuice of onions and Fennell together, be marvellous good to be taken in the beginning of a * dropisie. *Item*, That their iuice being incorporat with Rue and Hony, is soueraigne for the Squinace. As also that they will keep waking those who are fallen into a Lethargie. To conclude. *Varro* saith, That if Onions be braied with salt and vinegre, and then dried, no worms or vermine will come neere that composition.

CHAP. VI.

¶ Of cut Leekes or Porret: of bolled Leeks: and of Garlicke.

Porret, otherwise called Cut-Leekes or vnset Leeks, stancheth bleeding at the nose, in case it be stamped and put vp close into the nosethrills, or otherwise mingled with the powder of the Gall-nut, or Mints. Moreover, Porret staith the immoderat shift or fluxe of blood, that follows women vpon a slip or abortiue birth, if the iuice thereof be drunk in breast-milke. In the same manner it helps an old cough and al other diseases of breast and lungs. Burnes and scaldings are healed with a liniment made of Porret or Leek blades: likewise the Epinyctides, for so in this place I rearme that vicer, which in the lachrymal or corner of the eie runneth and watereth continually: some call it Syce, that is to say, a fig. And yet others there be who understand by that word [Epinyctides] the blackish or blew blistering wheals, the bloody fells I mean and angrie chilblanes, that in the night disquiet and trouble folk that haue them. But to come againe to our Porret: the blades thereof stamped and laid too, with Honie, healeth all sores and vlcers whatsoeuer. The biting of any venomous beast, the sting also of Serpents, are cured therewith. As for the impediments of the hearing and the ears, they be remedied with the iuice

A of Leeks and Goats gall, or els a like quantitie of honied wine instilled thereinto. And as for the whistlings or crashing noises that a man shall heare within head otherwhiles, they are dis-cussed with the iuice of Leeks and womans milke dropped into the ears. If the same be snuffed vp into the nosethrills, or otherwise conueighed that way vp into the head, it easeth head-ach: for which purpose also it is good to poure into the eares, when one goeth to bed and lieth to sleepe, two spoonfuls of the said iuice, and one of Honie. The iuice of Porret if it be giuen to drinke with good wine of the grape, against the sting of serpents, and namely, Scorpions: likewise fo taken with an * Hemine of wine, it cureth the pains of the loines or small of the back. Such as spit or reach vp blood, such as be diseased with the Phthisick or consumption of the lungs, such also as haue bin long troubled with the Pose, the Murre, Catarrhe, and other rheums, find great help by drinking the iuice of Porret, or eating Leeks with their meat. Moreover, Leeks are taken to be very good either for the jaundise or dropsie. Drinke the same with the decoction of husked Barley called Ptisane, to the quantity of one Acetabale, you shall find ease for the pains of the reins or kidnies. The same measure and quantity being taken with honey, muniteth the Matrice and naturall parts of women. Men vse to eat of Porrets or Leekes, when they doubt themselves to haue taken venomous Mushrooms. And a cataplasme therof cureth green wounds. Porret is a solicitour to wantonnesse and carnal pleasures: it allaieth thirstinesse, & dispatcheth those fumes that cause drunkenesse. But it is thought to breed dimnesse in the eie-sight, to ingender wind and ventosity, howbeit, not offensue to the stomack, for that withall it maketh the belly laxatiue. Finally, it scoureth the pipes & cleareth the voice: thus much of Porret in blade or cut Leeks vnset.

These headed Leeks that are bolled and replanted, are of the same operation, but more effectual than the vnset Leeks. The iuice therof giuen with the powder either of Gal-nuts, or * frankincense or els Acacia, cureth those that reject or reach vp blood. *Hippocrates* would haue the simple iuice therof giuen, without any thing els for that purpose: and hee is of opinion, that it will disopile the neck of the Matrice and the naturall parts of women, yea, and that they will proue fruitful and beare children the better, if they vse to eat Leeks. Being stamped and laid to filthie sores or vnclen vlcers with hony, it cleanseth them. Being taken in a broth made of Ptisane or husked barley, it cureth the cough, staith the rheume or catarrh, that distilleth into the chift or breast-parts: it scoureth the lungs and wind-pipe, and healeth their exulcerations. The like it doth if it be taken raw without bread, 3 bols or heads of them together each other day: and in this maner it will cure the patient, although he haught vp and spit out putrified and corrupt matter. After the same maner it cleareth the voice, & it inableth folk to the seruice of lady *Venus*, and auaieth much to procure sleep. If Leekes bols or heads be sodden in two waters, (i.) changing the water twice, and so eaten, they will stop the Lask, and stay all inueterat fluxes whatsoever. The pillings or skins of Leek heads if they be sodden, the decoction therof wil change the haire from gray to blacke, if they be washed or bathed therewith.

As touching Garlicke, it is singular good and of great force for those that change aire, and come to strange waters. The very sent thereof chaferth Serpents and Scorpions away. And as some haue reported in their writings, it healeth all bitings & stings of venomous beasts, either eaten as meat, taken in drinke, or annointed as a liniment: but principally it hath a special property against the Serpents called Hæmorrhoids, namely, if it be first eaten, and then cast vp again by vomit, and wine. Also, it is soueraigne against the poisonous biting of the mouse called Shrew: and no maruell, for why, it is of power to dull and kill the force of the venomous herb *Aconitum*, i. Libard bane, which by another name men call Pardalianches, because it strangeth or choketh Leopards, yea, it conquereth the soporiferous & deadly quality of Henbane: the bitings also of a mad dog it healeth, if it be applied vpon the hurt or wounded place with him. As for the sting of serpents verily, Garlick is exceeding effectual, if it be taken in drinke: but withal, you must not forget to make a liniment of it, the hairy strings or beard growing to the head, the skins also or tails and all, wherby it is bunched, tempered all together with oile, & laid vpon the grieved place: and thus also will it help any part of the body fretted or galled, yea, though it were risen vp to blisters. *Hippocrates* moreover was of this opinion, that a suffumigation made therewith, fetcheth downe the after-birth of women newly deliuered and brought to bed: who vsed also with the ashes of them burnt and reduced together with oile into the forme of a liniment, to annoint the running skulls of the head, and thereby cured and healed them vp. Some giue

* Sic & atritia samant.

* Regulus

* Hemine, is much about ten ounces.

* Called Man-na Terna.

* Hydrages, some read Hy-gochysis, i. Suffusians; out of Dioscorides, to wit, the Cataract.

In fco duplici.

* i. The wringings and torment of the vpper small guts.

Sarcogues, called otherwise S. Anthracis sic. Erysipelas.

* Contrary to Galien.

giue it boiled, others raw, to them that be short-winded. *Diocles* prescribeth it with Centaure to them who are in a droppe, he giue it also to purge the belly between, or in two figs. But green Garlick taken in good wine, together with Coriander, doth the deed more effectually. Some are wont to minister it to those that draw their wind short, being stamped and put into milke. *Praxagoras* the Physitian ordained to drinke it with wine, against the laundise: also against the black passion, in oile and thick *gruel. And in that sort he uied to annoint the swelling kernels called the kings euill. In old time the maner was to giue raw garlick to such as were bestraited or out of their wits. But *Diocles* appointed, that it should be boiled for phrentick persons. Certes, if it be bruised and so laid to the throat, or otherwise gargled with some conuenient liquor, it will do much good to them that haue the squinancie. Take three heads or cloues of Garlick, beat them well, and together with vinegre apply them to the teeth, they will mightily assuage the paine. Or do but make a collution with the broth wherein they were boiled, and hold it in your mouth, and afterwards put some of the Garlicke it selfe within the hollow teeth, you shall see much ease in iue thereupon. The iuice of Garlick together with goos-grease, is passing good to be dropped into the ears, to assuage their paine, and bring the hearing again. Being taken in drink, it clenseth the head from dandruffe, and killeth lice: so doth it also, if it be stamped and applied to the place with vinegre and nitre. Seeth it in milke, or do but stamp it and mingle it with soft fresh cheefe, and so eat it, you shall see how it will repress and stay Catarishes and Rheumes: after which manner it will make them speake cleare that be hoarse, and haue a rusty voice. But let a man who hath the Phthisicke, and is fargone into a Consumption of the lungs, drink it in bean broth ordinarily, he shall recover or find great ease. Generally, Garlick is better, boiled or roasted, than raw: and yet of the twain, it is not so good roasted as sodden: for in that order must it be taken for to help the voice and make a cleare breath. Also, being boiled in honied vinegre or Oxymell, and so drunke, it driueth out the broad wormes and all other such like vermin forth of the guts. Being taken in a thicke broth or gruell, it cureth the disease * Tinef-mus. Being sodden to the consistence of an Vnguent, and so applied as a frontal to the temples of the head, it allaieth their paine. Boiled with hony, then stamped and reduced to a liniment, it represseth red pimples. Seeth it with good old seame or grease, or in milk, it is singular for the Cough. See you one to reach vp bloud, or to spit filthy matter? Roast Garlick vnder the hot embers, and giue it the party to eat, with equall quantity of hony. Being taken with salt and oile, it is a soveraign remedy for them that be bursten or Spasmatike, that is to say, vexed with the Crampe. Applied with the fat or grease of an hog, it cureth all tumors and suppurious imposthumes. Being emplastred with brimstone and rosin, vpon Fistulaes or such hollow and blind vlcers, it draweth out all the filth and corruption that lieth rankling and festering within. But lay it to a sore with pitch, you shall see it fetch out spils and ends of broken arrowes sticking still within the flesh. The Leprosie, the running and dangerous *rettar, the red pimples also rising in the skin, Garlick doth first ete and exulcerate; but afterwards, with Origanum, it cureth and healeth the same. Yea, the very ashes of Garlick burnt, and so tempered with oile and the pickle, [Garum] that it may take the form of a liniment, doth the like. The wild fire also, or shingles, that hath gotten to a place, if it be annointed therewith, will be extinguished. Be any place of the body grown black and blew by stripes or blows, a liniment made of Garlick burnt to ashes and tempered with hony, will bring the natue and fresh colour again quickly. There is a deepe and fetled opinion among men, that if a man or woman do ordinarily take garlick with meat & drink, they shal find remedy thereby for the falling sicknesse. Also, that one head of Garlick taken in some styptick & harsh raw wine, with Lascerpitium, to the weight of one Obolus, driues away the Quartan ague for euer. But after another sort, if it be vsed; to wit, boiled with brused Beanes, and so eaten ordinarily with meat; there is no cough so rough, no vicer within the brest so foule and filthy, but it will stay the one, and cleanse, yea, and heale the other, so as the patient shall recover perfect health. Garlick maketh folk to sleep well, and giue it a good, fresh, and ruddy colour to the whole body. Garlick stamped with green Coriander, and drunken with strong wine, increaseth the heat of lust, and prouoketh to Lecherie. But as many good properties as Garlick hath, it is not without some bad qualities for them againe. It maketh the eies dim, it breedeth windinesse and ventositie, it hurteth the stomack, ouer liberally taken, & *causeth thirst; but let me not forget among other vertues which it hath: namely, that if it be giuen to Hens, Cockes, and other Pulleine, among their corne, it will keepe them from the pip.

As

A As for Horses, Mares, Asses, and such like beasts that cannot stale, or be groud and wrong in the bellie: stampe Garlick, and therewith rub the shap and naturall parts; it will prouoke the one, and ease the other.

CHAP. VII.

¶ Of wild Lettuce, as well that called *Caprina* as *Efopus*. Of *Isatis* and Garden Lettuce.

The first kind of Lettuce that groweth wild of it selfe without mans hand, is that which is commonly called *Caprina*, i. Goats Lettuce. This hearbe hath a propertie, that if it be thrown into the sea, it will presently kil all the fishes that approach neere vnto it. The milkie iuice of this Lettuce being turned thick, and soon after mixed with vinegre, to the weight of two Oboli, and one Cyath of water put thereto, is giuen with good successe to those that haue the Drop sic. The stalks and leaues stamped, with some salt strewed among, and so applied as a cataplasme, do heale vp the sinews that be cut or wounded. The same herb being brused together with vinegre, preferueth a man from the tooth-ach, if he vse two mornings euery moneth to wash his mouth with a collution made thereof.

A second kind there is of wild Lettuce, which the Greeks name *Efopus*. The leaues thereof being beaten in a mortar and with barly floure, applied as a pulsette, heale all vlcers: this groweth ordinarily in corn fields.

A third sort comming vp in the woods, is named otherwise * *Isatis*. The leaues wherof being likewise beaten together with Barley-meale or floure aforesaid, cureth green wounds.

A fourth kind there is besides of wild Lettuce, named *Glastrum*, i. Woad, wherewith diuers vse to colour their wooll. It might be likened to the wild Dock for the leaues, but that they be more in number, and of a blacker green withall. This hearb stancheth bloud. It represseth and cureth the fierie and eating tetter, the cankerous and filthy vlcers also which run and spread ouer the whole and sound parts: also it dissolueth swellings before they gather to an head, & tend to supuration. The root or leaues thereof be good against *S. Anthonies* fire, applied in a cataplasme or liniment. It is a singular remedy also for the swelled & puffed spleene; and thus much for their properties in particular, respectiue to each feuerall kind: but to speak generally of them all that grow wild, they agree all in this, that they be white, that their stem growes otherwhiles to the height of a cubit; that both it and the leaues be rough in handling. Of these wilde Lettuces, That which hath round and short leaues, some there be who call *Hieracia*; because that Faulcons and such like Haukes are wont to scrape and scratch this herb to get forth the iuice, wherewith they annoint and rub their eies, and thereby recover their sight, when they perceiue it to be darkened or dim. All the sort of them are full of a white iuice: & the same of the like vertue as is the iuice of Poppies. Ordinarily is this iuice gathered in haruest by incision of the stalk: put vp it is in new earthen pots neuer occupied, and so reserued for many excellent effects that it hath. For first and formost, being applied with womans milk, it healeth all maladies that the eies be subiect vnto, as namely, it riddeth away the cloudy webs therein, the cicatrices and scars: all filthy sores with a burnt roofover them, and principally disparetheth the mist and dimnesse that troubleth the eie-sight. It is vsually also laid with a locke of wooll to the eies, for to repress and stay the waterish humor that hath found a way thither: the same iuice, if one drink it, to the weight of 2 Oboli, in vinegre and water, is a good purgation. Being taken in wine, it cureth the venomous stinging of serpents. To which purpose, the leaues being parched & dried against the fire, their tender stems also being brused, are drunk with vinegre. A liniment made of them, is passing good against the prickling of scorpions, but peculiarly for the sting of the venomous spiders *Phalangia*, there must be wine and vinegre mixt therewith. Soueraigne defence, ties also these wilde Lettuces be, against other poisons; saue those that kill by strangling and suffocation, or such as haue a special spight to the bladder; neither are they of any power against

Ceruse or white lead. A cataplasme made thereof with hony and vinegre, & so laid to the belly, purgeth the rotten humors, & expelleth the worms therof bred: their iuice is singular good for them that pisse with pain and difficulty. *Cratogeomys* prescribeth to giue the weight of 2 Oboli of the said iuice, in one Cyath of wine, to those that be in a Drop sic. Some there be who draw the iuice out of the garden Lettuce also for the same purpose, but not with like effect. The peculiar propertie

It should seeme he meant here the *Tithymalus*, which be *Lactariae*.

* *Pliny* should seeme here to be deceived: for *Isatis* is the same that *Glastrum*, i. Woad, and the wilde therof indeed is leaved like Lettuce which was the occasion of his error.

properties of which Lettuces, I haue partly written of heretofore, & namely, how they procure sleep, abate fleshy lust, coole intemperat heats, cleanse and strengthen the stomacke, and finally, increase blood.ouer and besides, they haue other properties not a few, for they resolute and dissolue ventosities, they breake winde vpward, and make one rift and belch sweet, and finally help digestion, and of themselves cause no crudity in the stomack. Certes, I cannot say of any thing else but it, that being eaten, both giueth an edge to appetite, and also dulceth the same: and all according as it is taken, more or lesse. By the same reason also, if a man eat liberally of them, they will make the belly soluble: if in a meane, they will stay a Laske, and bring the bodie to costiuenesse. They cut and dissolue the grosse viscositie of slimie fleame: and as some Physiti- ans haue written, do clarify the senses. Moreouer, if a mans stomacke be quite gone, so that hee neither desireth to receiue any thing into it, nor can hold and keepe that which it receiueeth, he shall find notable comfort by eating of garden Lettuce. But for this purpose they must be ta- ken vnwasht, with some sharpe sauce made with vineger, to the quantitie of a certaine Oboli, yet so, as that the tart and harsh taste thereof be tempered with some wine cuit or other sweet liquour for to dip into. Moreouer, this regard ought to be had, that if the fleame lying in the stomacke, be very tough and grosse, the Lettuce would be eaten with vineger of Squilla or the sea-Onion, or else with Worme-wood Wine: and if the Cough bee also busie, then Hy- scope Wine would be mingled withall. In case there bee a fluxe occasioned by febleness of the stomacke, then would Garden Lettuce be eaten together with wilde Endiue or Cicho- rie: and so are they good also for the hardness and swelling in the mid-riffe and about the heart.

White Lettuce eaten in good quantitie, helpeth the infirmities of the Bladder, and agree-
very well with those who be troubled in their brains, and ouercharged with melancholy. *Praxa-*
goras aduised also, That they should be eaten for to helpe the bloody flux. Moreouer, if they be
laid presently (in manner of a liniment, with salt) vpon a burne or scald, while it is new, and be-
fore the place blister, they will fetch out the fire and do very much good. They keepe downe
and repress cancerous vlcers, that would be running and eating into the flesh, if they bee ap-
plied at the beginning with salt. petre, and afterwards with wine. Being brused into a liniment
they heale *S. Ambrosius* fire, if the place be annointed therewith. If their stalkes or stemmes bee
stamped with drie grout or Barley meale, and laid too as a cataplasme with cold water, they mi-
tigate the pains that follow dislocations or lims out of ioint, they affwage also dolorous cramps
and convulsions. Being applied in manner of a pulsette with wine and dry Barley groats, they
do allay the grieue of red and angry wheales. Moreouer, they were wont in times past to boile
them betweene two platters, and so giue them for the disease Cholera, wherein choler is so out-
ragious, that it purgeth vncessantly both vward and downward. But for this purpose, there
would be choise made of the fairest and greatest stemmes, such also as are bitter, for they bee
best. Some to the same effect, make a decoction of them in milke, and so minister it vnto the
patient in a clyster. These stalkes being well and thoroughly boiled, are said to be very whole-
some for the stomacke also: like as, for to procure sleepe, the garden Lettuce is thought most
effectuall, namely, that which is bitter and yeeldeth store of milke, which hertofore we haue ter-
med *Meconis*. This milke Physicians prescribe with very good successe for to clarifie the eie-
fight, namely, if it be mingled with womans milke, and the forehead annointed therewith in good
season and betimes. After the same manner it helpeth the infirmities and diseases of the eyes,
proceeding from cold causes. Other vertues and commendable properties besides I finde in
Lettuce, of strange and wonderfull operations. And namely, that it cureth the diseases of the
breast, as well as Sothern-wood doth, if it be taken with the best hony of Athens. *Item*, That if a-
ny women do eat thereof, they shall haue their monthly sicknesse come orderly. Also, that the
feed of garden Lettuce is giuen to very great purpose against the pricke or sting of any veno-
mous Scorpion. Moreouer, That if the seed be stamped and taken in wine, it secureth one from
the imaginarie fantasies of *Venus* delights, in sleepe, and the pollutions also that thereof do insue.
Finally, that certain waters which vse to intoxicate and trouble the braine, shall neuer hurt them
that eat any Lettuce. Howbeit, some are of opinion, that the ouermuch vse of Lettuce at meat
enfeebleth the eies, and impaireth their cleare sight.

¶ *Of Beets and their sundrie kinds. Of Endive. Divers sorts of Cichorie. Of garden Endive, and two kinds thereof.*

THe Beets of both sorts are not without their medicinable vertues : for be it the white or the blacke, if one take the root thereof fresh and new out of the ground, wet it thoroughly, and soke it well in water, and then carry it about him hanging by a string or lace, it is a soveraigne preservative against the biting of serpents. The white Beet boiled and eaten with raw Garlick, expelleth the broad wormes in the belly. The roots of the black, sodden after the same manner in water, rid away the dandruffe or unseemly skales within the haire of head or beard. **B** And indeed generally for any vse, the black Beet is more effectuell than the white. The iuice thereof is singular good for an old and fetled head-ach. For the dizziennes or swimming in the head. Also, it riddeth away the singing and ringing in the eares, if it be dropped into them. It procureth vrine : being injected by a clyster, it cureth the bloody flux : it helpeth also the laun-
C
pise. Moreover, the said iuice appeaseth the intolerable pain of tooth-ach, if the teeth be rubbed or annointed therewith. Singular it is, against the stinging of serpents : but then it must be drawne from the root only. And make a decoction of the said root, it helpeth kided heeles. As for the iuice of the white Beets, it staieth the rheume or waterish humor that falleth into the eies, if the forehead be therewith annointed. And put but a little Allum thereto, it is an excellent remedy against *S. Anthonies* fire. White Beets only stamped, although there come no oile vnto them, healeth any burne or scalding, if the place be therewith annointed. Moreover, against the breaking out into red and angry pimples, the same is very good. But seeth Beets, and make thereof a liniment, it represseth the vlcers that run and spread abroad. The same being raw, rubbed vpon the bare places, where the haire is shed, recouereth haire, yea, and staieth the running skales of the head. The iuice of these Beets tempered with honey, and snuffed vp into the head by the nostrils, clenseth the braine. There is a certain meat made with * Beets & Lentils boiled together, which commonly is eaten with vineger for to make the body laxatiue. The same being ouerfodden to a thicke consistence, staieth both the turning of the stomacke, and flux of the belly.

D There is a kind of wild Beet, which some name Limonion, others Neuroides: it hath leaues much lesse and tenderer than the other, howbeit, growing thicker, & rifest vp many times with eluen stalks. The leaues of this Beet are very good for burnes and scalds: they restraine and stay all Fluxes by drop meale, which breed the Gout. The seed being taken to the quantity of one Acetabulum, cureth the bloody flux, & healeth the vlcer of the guts that causeth the same. Some say, that if this Beet be sodden in water, the decoction will scoure and take out any stain in cloth, euen the very iron-mole: likewise it will wash away any spots in parchment.

Now as touching Endiue or garden Cichorie, furnished also it is with many properties effectuall in Physicke. The iuice thereof mingled with oile Rosat and vineger, allaieth the paine in the head. The same if it be drunk with wine, is good for the liuer and bladder. Also, if it be laid to the eies, it stoppeth the humor that hath taken a course thither. The wild Cichorie, that groweth wandering here and there abroad, some of our Latin writers name * Ambugia. In Ægypt they cal the wild Endiue, Cichoreum; & the tame garden Endiue, Seris: the which indeed is lesse than the other, fuller also of ribs and veines, As for the wild, which is Cichorie, it hath a cooling nature, being eaten as meat; but applied in forme of a liniment, it is good against the collection of humors that ingender imposthumes. The iuice of it foddren, doth loosen the belly. Wholesome it is for the Liuer, the Kidnies, and the Stomack. Likewise, if it be boiled in vineger, it resoluth the painfull torments occasioned by the stopping or difficulty of vrine, and openeth passage to make water at ease. Moreover, if the iuice or decoction thereof be drunk with honied wine, it cureth the Iaundise, so it be without a feuer. It is comfortable also & helpfull to the bladder. Boiled in water, it is so powerfull to bring downe womens termes, that it is of force to send out the child, if it be dead in the mothers belly. The Magitians say moreover, that whosoeuer annoint their bodies all ouer with the iuice of this herb and oile together, they shal be right amiable, and win the grace and fauor of all men, so as they shal the more easily obtain whatsoeuer their heart stands vnto. And verily, for that it is so singular and wholesome to mans body, some giue it the name of *ἰατρικὴ*, others of *καταπρατική*.

* For that being eaten with meat, it maketh the breath sweet.

As for another wild kind, some call it *Hedynois, & that hath a broader leafe than the rest. Being sodden, it is astringent and will strengthen a weak stomach: and eaten raw, it bindeth the belly and staith the lask. Hotesome it is for such as haue the bloody flux, the rather if it be taken with Lentils. In sum, as well raw as sodden, both kinds, the one & the other, help those that haue cramps and ruptures. Comfortable it is likewise to such as vpon occasion of debility or sicknesse, haue their nature or seed run from them against their wills.

Touching Cichory of the garden, which is very like vnto the Lectuce, there be two kindes thereof, but the green that seemeth to be of a wilde and savage nature, is the better: of a more brown and dusky colour it is, and a Summer herb only. The other indeed is whiter and continueth all winter, howbeit worse of the twaine: and yet both the one and the other, are right comfortable to the stomach, especially when it is ouercharged with waterish humors. Beeing eaten in a salad with vinegre at meat, they refresh and coole mightily: so do they also in forme of a liniment, and by that means resolute other humors besides those in the stomach. Generally the roots of all wild Cichories being sodden with barley grouts to a gruel, and so supped off do comfort a weak stomach. Being reduced into a liniment, & applied to the region of the heart about the left pap, with vineger, they cure the trembling thereof, and the faint cold sweats that break out vpon weaknesse. All the sort of these Cichories as well tame as wild, being taken in broth each other day, be good for gouty persons, for such also as reach and cast vp blood, shed their sperm or haue the running of the reins. Howbeit *Petronius Diodotus* in his booke intituled *Contradictions, utterly condemned the garden Endiue Seris, and alledged many reasons and arguments to confirme that position of his; howbeit the whole colledge of all Physicians besides stand against him.

CHAP. IX.

¶ Of Garden Coleworts, *Lappas*, Sea Coleworts, or *Soldanella*; of *Squilla*; of other bulbous roots, as the Potatoes: and of *Bulbium*.

THE commendable proprieties of the Colewoort are so many, that it were a long labor to decipher them all, considering that both *Chrysippus* and *Diocles*, two Physitians, haue compiled each of them a booke particularly of this herbe, wherein they haue collected their virtues, as they be appropriat and respectiue to euery part of mans body; yea and before all others, *Pythagoras*, and after him *Cato*, haue as amply set out the praises thereof. As for *Catoes* opinion and judgement of the said herb, I am the more willing in this place to set downe and follow diligently, because it might be knowne what simples and what drugs they were which the old Romans vsed for their Physicke * 600 yeres after the foundation of the city. The Greeke writers of greatest antiquity, haue made three kinds of Coleworts; to wit, the crisped or ruffed cole, which they called *Selinas* or *Selinoides*, for the resemblance that the leaues haue to Parsley: these Coleworts be good for the stomach, and gently loosen the belly. The second sort is named in Greeke * *Lea*, with broad leaues springing forth from a great stem: whereupon some haue giuen it the name of * *Caulodes*: these woorts are to no vse at all for Physicke. The third is properly called by the name of *Crambe*; very well stored with leaues this is, but those are smaller than the rest, simple also & plain: bitterer besides this Cole is in comparison of others; but most effectually in Physick. Howbeit, *Cato* preferreth before all, that which is crisp and frizled: next vnto it, the smooth Cole, with the large leaf & big stalk. He commendeth the Colewoort (stamped raw together with vineger, honey, Coriander, Rue, Mints, and the root of *Laser*) to be singular good for the head-ach, the mist and dimnesse of the eyes, the appearance of sparkling mores before them, the stomach and precordiall parts; if a man take fasting 2 Acetables of this composition. And he saith moreover, that this confection is so soveraign, that they who do but bray and beat the ingredients, shall sensibly find themselves mightily comforted and fortified thereby. And he concludeth withall, that Coleworts may be either stamped together with the foresaid species, and so taken in a supping; or els be eaten, first dipped and soked in the forenamed liquor: as also that a liniment made of them, together with Rue, a little Coriander, some few corns of salt, and barley meale, is soveraigne to assuage the paines of any gout, be it in feet, hands, or any other joint whatsoeuer. Moreover, that a decoction made thereof, doth wonderfully comfort and fortifie the sinewes, yea and mitigate the arthriticall griefes or ioint-ach, if

* For about that time *Cato* liued.

* i. Smooth

and plain.

* i. The stem-mic Cole.

A if the parts be tormented therewith.ouer and besides, a fomentation made therewith, is singular for all fresh wounds, old vlcers, yea and cankers, which could not possibly be repressed or healed by any other medicines: but he appointeth first that they be bathed in hot water, and then a cataplasme of the said worts to be laid vpon the afflicted place, and the same to be refreshed twice a day. By which manner of cure, he saith, that fistulous sores may be healed; dislocations set straight, swellings and imposthumes drawn outward to an head; or otherwise where need is, discussed & resolved, before they tend to suppuration. He addeth moreover & saith, that whosoever eat good store of sodden Coleworts, together with oile and salt fasting in a morning, shall fall to sleep again in the night if they were before ouercharged with watching, & in their sleep shall not be troubled with dreams or other vnquiet fancies and imaginations. Furthermore he affirmeth, that worts twice boiled, are excellent good for the torments and wrings of the belly, so there be ioyned to the second decoction, oyle, salt, cumin, and barley groats; and thus beeing eaten without bread, they are the better among other effects that these Coleworts do work, this is not to be forgotten, that they purge cholerick humors, being taken with sweet grosse wine. More than that, he auoucheth, That if his urine, who vse to feed of Colewoorts, be reserved, it is singular good for the sinews, if the grieved part be bathed therein after it is made hot again. But because you should fully vnderstand his meaning, I care not much to set downe his very words for to expresse the same the better. If (quoth he) you wash little children with the said vris prepared in manner aforesaid, they will neuer beweak and feeble in their limbs. He aduise th moreover, to drop the juice of Colewoorts warme into the eares with wine, and assureth vs that it is good for them that be hard of hearing. Finally, that ringworms, nettars, itch, and dry scabs (such as be not exulcerat) are healed thereby.

Now concerning the opinion of the Greeks also, as touching Coleworts, I thinke it meet to set them down for *Catoes* sake, I mean touching those points only that he ouerpassed and omitted. First and formost therefore, the Greeks hold, that the Colewoort being not thoroughly sodden, purgeth choler & keeps the body soluble; howbeit twise sodden, it bindeth the belly. Item, That it is contrary to wine, and a very enemy to vines. And more particularly, if it be taken fasting, or in the beginning of a meale before other meat, it preferueth a man from drunkennesse, and eaten after meat when a man is drunken indeed, it riddeth away the fumes in the brain and bringeth him to be sober. Also, that it is a meat appropriate to the eyes, and cleareth the sight very much; in so much as the iuce of it raw is passing soveraigne for that purpose, in case it be mingled with the pure Atticke hony into an eie-salue, and therewith the corners of the eyes be but touched only. Moreover, that it is passing light of digestion, and clarifieth all the senses, if it be ordinarily eaten. *Erasistratus* and all his schoole, doth ring and resound again with one voice and open mouth, That there is nothing in the world better for the stomacke, nothing more wholsome for the sinews; and therefore with one accord they prescribe the vse thereof, for those that haue the palse or resolution of the nerues; for as many as be troubled with the trembling and shaking of their limbs, to such also as reach & cast vp blood. *Hippocrates* giueth counsel to them that be afflicted with the bloody flux or exulceration of the guts; to those likewise who be subiect to the flux proceeding from the weaknesse of the stomacke, for to eat it twise sodden with salt. Also he prescribeth it in the cure of *Tinesmos* (which is a prouocation or extraordinary appetite to leage, without doing any thing;) and of the paine in the back or reins. And he is of this judgement, That women in childbed shall be good nourses and haue plentie of milke, if they eat of Cabbages or Coleworts; yea and women in generall, by feeding thereupon, shall see their monthly termes duly. As for the Cole it selfe, if it be chewed raw, it is (by his saying) of force to expell a dead infant in the wombe. *Apollodorus* holdeth resolutely, That either the seed or iuce thereof taken in drinke, is a singular remedy for them who suspect that they haue eaten venomous mushrooms. *Philistion* giueth the iuce thereof in Goats milke, together with salt and honey, vnto such as haue a cricke or cramp drawing their necks backward, that they are not able to turne their heads. I find moreover, that by eating Coleworts at meat ordinarily, and by drinking the decoction thereof, many haue been deliuered from the gout. It is an vsual medicine and approved by experience, to giue it with salt for the fainting sweats & trembling of the heart, as also for the falling euill. Such as be troubled with the spleene, finde much ease thereby, if they continue drinking the iuce thereof in white wine at their meals forty daies together; like as those that be sped with the yellow jaunise, or in fits of frensie, be cured with

with gargling & drinking juice of Cole-roots raw. But against the Hocquet or Yex, there is a notable medicine made with it, together with Coriander, Dill, hony, pepper, and vineger. If the pitch of the stomacke be annointed therewith, the Patient shall evidently perceiue, that it will dissolue the wind and puffing ventosities therein. Also, the very water of the decoction incorporate together with barley-meale, vnto a liniment, is singular good for the stinging of Serpents, and mundifieth filthie old vlcers: to which purpose also serueth the juice thereof, applied with vineger and Foenigreek. After the same manner, some make a cataplasme, and apply it to goutic joints. The bloody, falls and blistering chilblanes, and generally all humors that ouer-run the body and fret the skin, are allayed by the application aforesaid. In like manner, the sudden mists and dimmes which commeth ouer the eie-sight, is dissolued & dispatched clean, in case one do no more but chaw this herb in vineger. A liniment made with it and * brimstone together, helpeth the black and blew spots of dead brused blood lying vnder the skin, and reduceth them to their owne colour. But if round alume and vineger be joined therewith, it cureth the white leprosie, and dry scab [called of some *S. Magnus euill.*] And in that manner prepared, it keepeth the haire fast that is ready to shed. *Epicharmus* saith, That this herb is foueraigne good to be implastred vpon those tumors and swellings that be incident to the priuy members, and the rather, if the said implaster be made with bean meale. The same being applied with Rue, is good for convulsions or crampes. Moreouer, there is a medicine prescribed to bee made of Coleworts and Rue-seed, against the extreme heat of feuers ardent, as also for the defects and infirmities of the stomack, and to send out the after-birth in women newly laid. The powder of Colewort leaues dry, doth expell or euacuate one way or other, the venome left behind by the biting of the hardy shrew-mouse. Of all kinds of Coleworts, the sweetest and most pleasant to the tast, is the * Col-flory, although it be counted good for nothing in Physick, and besides vn-wholsome, as being hard of digestion and an enemy to the kidnies.ouer and besides, I must not forget this one thing of Coleworts, That the broth or decoction thereof (so highly praysed for many good vses that it is put vnto) if it be poured on the ground, hath but a stinking smel with it. Wort-stocks being dried and burnt into ashes, is thought to be a caustick medicine or potentiall cautery. The same ashes mingled with old greafe and reduced into a cataplasme, helpeth the pain of the Sciatica: but with Lafer and vineger, it is a depilatory, (.) keepeth the hayre from growing againe where it was once fetched vp by the roots. The sayd Colestocke ashes set ouer the fire vntill it suer only, or haue one walme at the most, and so drunk with oyle, or otherwise foddren, and the decoction taken alone without oyle, is good for Spasmes and crampes, for inward bruises, and for such as are false from some high place. Lo, what a number of prayse-worthy vertues are recounted of Coleworts! And is there (I pray you) no fault to be found with them: are they blamelesse? ywis no: for euen those writers who extolled them so highly, note them for making a stinking breath, and for hurting the teeth and gums: insomuch as in Egypt, they be in so bad a name for their bitternesse & vnpleasant tast, that no man knoweth how to eat them. But to come again vnto *Cato*, he commendeth the effects of the wilde or wandering Colewort infinitely aboue the rest; insomuch as he affirmeth, that the powder of it dried, being gathered and incorporat with some conuenient liquor into the forme of a pomander, or otherwise strewed vpon any posie or nosegay, so as it may be receiued and drawn vp into the head by the nostrils, cureth the * filthy vlcers growing therein, and the stinking smel that commeth from them. This Cole-wort, others call *Petraea*, and this is that which of all the rest is most aduerse and the greatest enemy to wine; this is it that the vine (by a secret Antipathie in nature) doth especially auoid, if it haue room to decline from it; but in case she cannot shift from it, she dieth for very griefe. This plant hath the leaues growing two by two together, and those small, round, smooth, and liker indeed to the young plants of * Beets than to other Coleworts; whiter also it is, and more rougher clad with a mossie downe, than is the garden Colewort. *Chrysippus* writeth, That it is a foueraigne medicine for flatuosities, and such as be oppressed with melancholy: that it is a singular salue for fresh wounds, being applied with hony; but with this charge, That the plaster be not taken off in seuen daies. Also, if it be stamped and applied with water, it is an excellent cataplasme for the Kings euill, and fistulous inward vlcers. Other Chirurgions and Physitians do affirm, that it represseth running & corrosiue sores which eat into the flesh, such as the Greeks name *Nomus*. *Item*, that it doth extenuate and resolue all excrecence of proud, ranke, or dead flesh; yea, and it doth incarnat, heale vp, and skin very faire without

*Cum Sulphure illita.

*Gyma.

*Some call it Petraea.

*Oleria.

A without skar, by their saying. Moreouer, if it be chewed, or the juice thereof gargarised with hony, so that the herb were fouden before, it cureth the sores in the mouth called cankers, as also the mumps and inflammation of the kernels in the throat, called amygdales, or almonds. Semblably, if a man take three parts of this herbe, with twaine of alume, and together with Vinegre make a liniment thereof, it will cleanse the inueterate dry scab, and the mortified leprosie. *Epicharmus* is of opinion, That for the biting of a mad dog, a man need doe no more but lay to the fore a cataplasme of this herb alone: but surer it were (saith he) and more effectual, if Lafer and strong sharp vinegre were ioyned thereto. He addeth moreouer and saith, That if it be giuen to dogs with some piece of fleish it will kill them. And yet the seed being parched is a remedie against the sting of serpents, and a countre-poison to venomous Mushrooms and Buls blood. The leaues boiled and giuen with meat, or otherwise raw and made into a liniment together with brimstone and nitre, help those that be diseased in the splene. The same liniment mollifies the hard swellings of womens breasts. The ashes of the root being burnt, cure the vula, or swelling of the wezil in the throat, if it be but touched therewith. Also a liniment thereof with hony applied to the inflamed kernels behind the eares, represseth them, yea and healeth the stinging of serpents. I haue not yet done with the Colewort and the vertues thereof; but one instance more I will giue you, to proue the wonderfull force and effect that it worketh. If any brasie pot caldron, or such like vessel wherein we vse to seeth water ouer the fire, haue gathered in continuance of time a fur or crust baked within, such as by no washing or scouring can be rid away, bee the same neuer so hard, deep settled, and inueterate; boile but a cabbage or Colewort in it, and the same will pill and go from the pot sides.

Among wild worts we may place *Lapsana*, a plant growing to the height of a cubit, bearing a furred or hairy leafe, like for all the world to the Navey, but that the floure is whiter. This herb is commonly foddren and eaten in pottage; and so taken it moderately loosneth the belly.

The sea Colewort [otherwise named *Soldanella*] of all others purgeth most forcibly: in regard of which acrimonie that it hath to stir the belly, Cookes vse to seeth it with fat meat, and yet is it most contrary to the stomack.

Touching Squills of Sea-Onions, Physitians hold that the white is the male, and the blacke the female: but the whitest of them be euer best and of most vse. The maner of preparing and dressing them is after this sort: First, the dry tunicles or skins being pilled off, the rest, which is quick and fresh vnderneath, must be cut into slices, & so infiled vpon a thred along, with a pretty distance between euery one, and hanged vp to dry: afterward, when the morcels be sufficiently dried, they are to be put, hanging still as they did by a string, into a barel or vessel of the strongest and quickest vineger that can be gotten, and therein they must hang so as they touch no part of the said vessel: but this would be set in hand with 48 daies before the summer solstice. Which done, the barrel of Vineger before said being well luted and stopped close with plastre, must be set vnder a rooffe of tiles, to receiue the heate of the Sun all the day long from morning to night. Now when it hath bin thus sunned so many days as are before named, the vessel is removed from vnder the case of tiles, the Squilla taken forth, and the vinegre poured out into another vessel. This vinegre clarifieth their eie-sight who vse it: comfortable it is to the stomack and sides, and asswageth their paine, if it be taken in small quantitie once in two daies: for if a man should dring ouer-liberally of it, so forcible it is that it would take away his breath, and cause him to seem dead for the time. Squilla chewed alone by it selfe is wholsome for the gums and teeth. Being drunk with vineger and hony, it chafeth out of the belly the long flat worms and all other such like vermin. If it be but held vnder the tongue while it is greene and fresh, it allaieth thirsting in the dropic, and causeth that the Patient shall desire no drink. The boiling of Squilla or the sea-onion is after many sorts: for some, after they haue either well luted, or els greased it all ouer with fat, put it into a pot of earth, and then set it into an ouen or Furnace to be baked. Others slice it into gobbets, and so seeth it between two platters. Some take it green and dry it, then they cut it in pieces and boile it in vineger; and being thus vfed and

F prepared, apply it to the places which be stung with serpents. Others againe rost it first in the embres, and after they haue cleansed it from the vtmost pilling, take the best of it onely in the mids, and seeth the same again in water. Being thus baked and sod both, it serueth to be giuen in a dropic. And if it be drunk to the quantitie of three Oboles with hony and vinegre, it prouoketh vrine with ease. In like maner, this composition is good for those that be troubled with

the spleene, or haue weak and feeble stomacks, or be troubled with gnawing and pain there, such also as cannot hold their meat, but it will flote aboue and come vp again: provided alwaies, that there be no vicer within the body. Moreouer, it is excellent good for the wringing in the guts, the jaunise, the old cough, with shortnesse of wind. The leaues emplaistred resolue the wens or swelling kernels in the neck, commonly called the Kings euil, but they must lie foune daies before they be removed. Being sodden in oile and reduced to a liniment, and so applied, it murthereth the skurfe or dandruffe of the head, the running skalls likewise that are bred there. It is vsed also (boiled vp with hony into a certain confection) taken with meat for to helpe digestion, and in that sort it purgeth the intrals. Sodden in oile and tempered with rosin, it heales the chaps and clifts in the feet. The seed of Squilla implastered with hony vpon the reines of the back or the loins, ease the pains. *Pythagoras* was of opinion, and so reported, that if the Squilla or Sea-onion were hanged vp in the entry of any dore, it kept out all charms, enchantments, or forceries. And thus much of Squilla.

Moreouer, the plants called Bulbs, being applied in form of a liniment, with brimstone and vinegar, do cure the wounds of the visage: and stamped by themselves alone, and so laid to, they help the contraction or shrinking of sinues: and if there be wine added thereto, it clenseth the dandruffe in head, beard, and eye-browes: but applied with honey it cureth the biting of mad dogs: howbeit *Erastophanes* taketh pitch in stead of hony for the said purpose: who writeth besides, That a cataplasme of them and hony together, stancheth blood in a green wound: but others ioyne Coriander and corn-meale to the rest, properly for bleeding at the nose. *Theodorus* cureth wild tetter and ring-wormes therewith, being applied with vinegar: and with stypticke harsh wine, or an egg, he vseth it for the breaking out in the head. Moreouer, a liniment made of Bulbs he applieth about the rheumaticke humors that fall to the eies, and by that means cureth those that be bleere eyed. Semblably, the red of this kinde especially reduced into a liniment, and first incorporat with hony and nitre, taketh away all the spots and blemishes that disfigure the face, if they be anointed with it in the sun: but with wine and Cucumber sodden they rid away also the red pimples. They be wonderfull good of themselves alone for green wounds; or with honied wine (according to the practise of *Damian*) so they be not removed in fūe dayes; and he was wont therewith to cure cracked eares also, and the flatuous flegmaticke tumours of the cods. Others there be who apply them with meale mingled among, to assuage the pain of the gout. Sodden in wine, and so applied as a liniment to the belly, they mollifie the hardnesse in the precordial parts and midriffe: and for the bloody fluxe, a drinke made thereof, together with raine water and wine, is a singular remedy. Being taken in pills as big as beanes, with Silphium, they are souveraine for the contraction of nerues or inward crampes within the bodie. Stamped into a liniment, they restrain immoderat sweats that be diaphoreticall. Comfortable they be to the nerues, and therefore they are prescribed and giuen in case of the palsie. Those with the red roots being made into a cataplasme with salt and hony, doth speedily cure the dislocations of the feet that be out of ioynt. The bulbs of Megara especially do prouoke lust. As for those that be called Hortensij, taken with Cuit wine or Bastard, make speedy deliuerance of the child out of the mothers belly. The wild bulbs brought into the form of pills, with Lascipitium, and so swallowed downe, do heale inward wounds and other maladies of the intrals. The seed of the garden Bulbes in wine, is a good potion against the sting of the spiders called Phalangia: and the roots with vinegre serue for a liniment against the stings of other serpents. The ancient physicians in times past were wont to giue the seed in drinke to them that were out of their wits. The floure of these Bulbes being bruised into a Cataplasme taketh away the red daped spots in their legs who haue sit neere the fire and burnt their shins. But *Diocles* is of opinion, that all these bulbous plants do dim the eie-sight: who saith moreouer, That they are not so good boiled as roasted: and yet be they all (saith he) hard of digestion more or lesse, according to the nature of each one that eateth them.

There is an herb which the Greekes call Bulbine, with a red bulbous root, and leaues resembling Porret: of which there is a singular good salve made for to heale green wounds, but none els. To conclude, as touching the bulb called Vomitorius (of the effect that it hath to prouoke vomit) it hath blackish leaues, and those longer than the rest.

CHAP.

CHAP. X.

¶ Of Garden Sperages, and the wilde Sperage Corrua: of Lybicum and Hormenium.

Of all Garden herbs, the Sperages are (by report) the best meat to be eaten, and agree passing well with the stomach, and verily being taken with Cumin, they dissolve the ventosities in the stomach, and dispatch the wind cholick, and withall they cleare the sight passing well. Kindly do they mollifie the belly and keep it soluble. If they be sodden in water, and a little wine put thereto in the boiling, and so giuen to drinke, they are very good for the pain of the brest & the backbone, for the diseases also within the guts. If one take the weight of three Oboli of the seed, and as much of Cumin, and so drinke it in some conuenient liquor, hee shall find a singular remedy for the pain of the reins, hanch, and loines. Garden Sperages sollicit vnto the game of loue, and procure good deliuerance of vrine; for which they had no fellow, but for feare that they will fret and exulcerate the bladder. Most Physicians doe highly commend their roots bruised and taken in white-wine, for to expell the stone and grauell; as also to allay the pains of the reins, flanks, and loins. Some there be, who giue to drinke in some sweet wine the said root, for the gricuous pains of the matrice: and the same being well and thoroughly boiled in vineger, is a souveraine remedy for the leprosie, to as many as will vse to drinke the said decoction. If a man be anointed with Asparagus or garden-Sperage, stamped together with oile and so made into a liniment, there will not (by report) a Bee come neere for to sting him.

The wild Sperage, some name it Corrua, others Lybicum, but the Athenians call it Hormenium: this herb is more effectually in all those matters aboue rehearsed than the former, & the whiter that it is, the greater force it hath. The jaundice it doth dissipate and driue away. When it is sodden in water, the decoction thereof to the quantity of a * wine pint or somewhat lesse, is vsually prescribed to them that desire to performe the act of generation lustily. For the same purpose also, the seed thereof and Dill, of each three oboli, is counted very good beeing taken in drinke. The iuice thereof boiled, is giuen against the stinging of serpents. The root of it and Fennell together, is thought to be most singular and of greatest efficacy in that case: for pissing blood, *Chrysippus* prescribeth to giue in two cyaths of wine for fūe daies together, three oboli of the seed of Asparagus, Parsley, and Cumin; but he saith withall, That this medicine is nothing good for the dropsie, notwithstanding that it is diuretical and prouoketh vrine. Also that it is aduerse and contrary to the delights of *Venus*, yea and to the bladder, vnlesse the same ingredients be sodden; and yet will that decoction kill dogs if it be giuen to them. To conclude, the iuice drawne out of the root thereof, being first boiled, and so held in the mouth, is good for the teeth.

CHAP. XI.

¶ Of Parsley, wild Ach, of Smallach, and Ach of the mountains.

Parsley is in great request, and no man lightly there is but loueth it: for nothing is there more ordinary, than to see large branches of Parsley good store, swimming in their potage: and commonly you haue not a sallad or sauce serued to the boord, you see not a piece of meat farced or seasoned, but Parsley carrieth therein a great stroke, and contenteth euery body.ouer and besides, if it be applied as a liniment, together with honey vnto the eies, so that they be fomented also ouer and anon with the hot iuice of Parsley boiled, it is a singular remedy for the humours distilling thither. Also, if it be stamped by it selfe alone, or els with bread or barley groats, it wonderfully helpeth the defluction falling vpon any other part, if the same be laid vpon the place afflicted in maner of a cataplasme. Moreouer, if a man perceiue that the fish in any pond or stew do mislike and grow sickly, it is a common practise to giue them green parsley to scoure and refresh them. Howbeit, for all that Parsley is so good, there is not an herb growing vpon the face of the earth, that learned men varie and disagree in opinion more about, than they do in it; & yet they hold all, that there is a distinct difference therein by the sex: for of Parsley there is both male & female; many which is the one & which the other, they accord not. *Chrysippus* saith, That the female hath more crispe & curled leaues than the male, and those boistrous & hard; that the stalk is thick, & the tast of the herb biting & hot. *Dionysius* describes it

to be more blackish, hauing a more stubbed & short root, & that it is apt to breed little worms. Both of them jump in this, that it is not to be admitted to the table, nay, they forbid to eat of it at all. Making a matter of conscience once to touch it as a meat, and why for because, forsooth, it is one of the viands ordained to be serued vp at funerall feasts. Our and besides, Parsley is thought to be an enemy to the eyes, and to trouble the sight. Also that the stem of the female ingendreth grubs & such like wormes; and so, whoeuer eateth thereof, man or woman, shall thereby become barren. Moreouer, they affirm, that if women newly deliuered, or such as nurse children, do eat of Parsley, the babes that suck and draw their breasts, shall be subiect to the falling sicknesse. And yet of the two, the male is lesse hurtfull: which is the very reason that it is not condemned among the forbidden herbs and such as be held vnlawfull to be eaten. Parsley being laid as a cataplasme to womens breasts, doth mollifie their hardnesse, & break the kernills. It giueth a pleasant tast to any water wherein it is sodden: the juice of this herb, & especially of the root being taken in wine, doth mitigate the pains in the loins and flanks: and being dropped into the ears, cureth the hardnesse of hearing. The seed of Parsley moueth vrine, draweth downe womens floures, and fetcheth away the after-birth. Seeth the said seed, and with the decoction bath the black and blew marks remaining after stripes or drie blows, it wil bring them to their own colour again. The same being laid as a liniment with the gleire or white of an egge vnto the reines of the backe, or being sodden in water, and the broth drunken, easeth their paines and strengthneth them. Being bruised & vsed in cold water by way of a collution, it cureth the cankers or vicers in the mouth: the seed drunk with wine, breaketh the stone of the bladder: so doth the root of it also if it be giuen in old wine. Also the said seed in white wine cureth the jaunise.

* It seemeth
thathc meaneth
by *Apiastrum* a kind of
Ranunculus,
i. Crow-foot,
called *Flammula*, out
Specere-wort,
or *apium risu*.

As touching our wild Ach, which we call in Latine * *Apiastrum*, *Hyginus* verily nameth it *Melissophyllon*. A venomous herb this is in Sardinia, and by all writers confession vtterly condemned: for surely I cannot chuse but range together in one rank al such as seem to depend vpon one name in Greeke.

But *Alifanders*, which the Greeks terme *Hipposelinum* is a good counterpoison against the biting of Scorpions. If the seed be taken in drink, it cureth the wrings & torments of the guts. The same being boiled and drunk with honied wine, helpeth the Strangurie and difficulty of making water. The root sodden in wine, expelleth stone and grauell by vrine: it putteth away also the paine of the loins, flanks, and sides. Taken in drinke, or applied as a liniment, it healeth the biting of a mad dog. The iuice thereof in drinke, heateth them that are ready to chill and be frozen with cold.

* Whereby,
some read *Orthoselinum*.

A fourth kind of Ach or Parsley some haue made that, which the Greeks call *Oreoselinum*. A plant this is, growing to the height of a span, and * vpright. The seed resembleth *Cumin*, and is found effectually to procure vrine and prouoke womens termes. Finally, as *Smallage* hath a propertie and vertue by it selfe to heale the pricke or sting of the venomous Spiders: so this mountaine Ach or Parsley of the hill, being taken in wine, is as effectually to bring downe the naturall purgation of women.

CHAP. XII.

¶ Of *Stone-Parsley*, named *Petroselinum*: and of *Basil*.

There is another kind of Ach or Parsley growing vpon rocks, which some call *Petroselinum*. An excellent herb for soule imposthumes and botches, vsed in this manner: take 2 spoonfulls of the iuice thereof, put it into a Cyathe of the juice of Horehound, and mingle all together in three Cyathis of water, and so drink it hot. Some haue set in the range of these *Aches*, that which is called *Buselinon*; which differeth from the garden Parsley, in that it hath a shorter stalk, and a root of red colour: but of the same operation and effect it is. For both taken in drinke, and applied as a liniment, it is of great power against the stinging of serpents.

Also, *Chrysippus* mightily crieth out vpon *Basil*, as being hurtfull to the stomach, suppressing vrine, and an enemy to a cleare sight. Moreouer, he saith, that it troubleth the brains, and putteth folk besides their wits: that it bringeth the Lithargie vpon as many as vse it, and breedeth opilations and diseases in the liuer. In which regard he saith, That Goats by a secret in Nature doe refuse and eschew it; concluding thereupon, that men also should take heed thereof and auoyd it. Some there be who haue not done with it so: but adde moreouer and say, That if *Basil* be

stam.

- A stamped and put vnder a stone, it will breed to a serpent: if it be chewed in ones mouth and layd abroad in the Sun, it wil ingender wormes and magots. The people of Africk are verily perswaded, and so they giue out, That if one be stung with a scorpion the same day that he hath eaten *Basil*, it is vnpossible for to scape with life. Likewise some hold opinion and would beare vs in hand, That if a man stamp a bunch or handfull of *Basil*, together with ten sea crabs, or as many crafishes of the fresh water, all the Scorpions thereabout will meet and gather together about that bait. Finally, *Diodorus* in his Empiricks or book of approued receits and medicines, saith, That the eating of *Basil* ingendreth lice. Contrariwise, the later writers and modern phisitions defend & maintain the vse of *Basil* as stoutly as the other blamed it: for first they auouch constantly, That Goats vse to feed therupon. Secondly, That no man was euer known to go beside himselfe who did eat thereof. Thirdly, That *Basil* taken in wine, with a little vineger put thereto, cureth as wel the sting of land scorpions, as the venom of those in the sea. Moreouer, they asseme vpon their knowledge by experience, That a perfume made of *Basil* and vinegre is singular good to recouer and fetch them again that be gon in a swoond. Also, that in the same maner prepared, it rouseth and wakeneth those that be in a lethargie and sleep continually; yea, and mightily cooleth and refretheth them that be inflamed & in a burning heat. A liniment made with *Basil*, oile *Rosat*, or oile of Myrtles in stead thereof, with vineger, aslwageth the paine of the head. Moreouer, being laied to the eyes with wine, it staith the waterish rheume that runs thither. Furthermore, comfortable it is to the stomach (as they say) for being taken with Vinegre, it dissolueth ventosities, and breaketh wind by rising vpward. Being applied outwardly, it bindeth and staith the running out or flux of the belly, and yet it causeth free passe of vrine in abundance. After the same maner it doth good in case of Jaunise and dropsie. It represseth the rage of choler that moueth both vpward and downward, yea, and staith all defluxions from the stomach. And therefore *Philistio* knew what he did well enough, when he gaue it to those that were troubled with the stomachical flux. As also *Plistonius* was well aduised, in ministering it sodden, for the bloody flux, the exulceration of the guts, and the Collicke. Some there be who giue it in wine to them who run euer and anon to the clofe stoole, sit downe and do nothing: to those that reach and cast vp blood; yea, and to mollifie the hardnesse of the precordiall parts. Being laied as a liniment to the nurses paps, it restraineth the abundance of milk, yea and drieth it vp. There is not a better thing in the world for to be dropped into the eares of little babes and sucking children, and namely with goose-grease. If the seed be bruised, and so snuffed or drawn vp into the nostrills, it prouoketh sneezing. The iuice moreouer laied as a liniment to the forehead, openeth the passages, that the rheumes or cold which lay in the head may breake away. Being taken at meat and dipped in vinegre, it mundifieth the matrice and natural parts of women. Mixed with Copperose or Vitriol, it taketh away warts. Finally it setteth folk forward to venerious pleasure; which is the reason that men vse to lay *Basil* vpon the shap of mares or she Asses at the time of their couering.

CHAP. XIII.

¶ Of * wild *Basil*, *Rocket*, *Cresses*, and *Rue*.

Wild *Basil* is endued with vertues and qualities seruing to all the purposes abouesaid: but the same is of better operation and more effectual. And these properties ouer and besides it hath by it selfe, namely, To cure the weaknesse of the stomach, and those accidents which come by often casting or immoderat vomits. The root thereof taken in wine, is singular good for the apstumes of the matrice, and against the biting of venomous beasts.

As touching *Rocket*, the seed cureth as well the venomous sting of Scorpions, as the biting of the hardy shrew. The same chaseth all vermin that be apt to ingender in mans body. A liniment made with it and hony together, taketh away all the spots that blemish the skinne of the face: and with vinegre represseth the red pimples whatsoeuer. The black or swert skars remaining after wound or sore, it reduceth to the former fair white, if it be applied with a beasts gal. It is said moreover, that a portion thereof made with wine, and giuen to those who are to receiue punishment by the whip, will harden them in such sort, that they shall feelee little or no smart at all by any scourging. And for seasoning of all kinde of viands, it hath such a pleasant grace in any sauce, that the Greekes thereupon haue giuen it the name of *Euzomos*. It is thought more-

* *Olymides*,
Dioscor.

moreouer, that a fomentation of Rocket, brused and stamped somewhat before, quickeneth and clarifieth the eye-sight: it easeth little children of the chin-cough. The root boiled in water, and so applied, draweth forth spils of broken bones. As touching the vertue that Rocket hath to procure the heat of lust, I haue spoken already: yet thus much more in particular I haue to say, that if one do gather three leaues of wild Rocket with his left hand, stamp them afterward, and so giue them to drink in honied water, this drink mightily prouoketh that way.

As for Cresses they haue a contrary operation, for they coole and dull the heat of the flesh, how soeuer otherwise they giue an edge to the wit and vnderstanding, as heretofore we haue declared. Of these Cresses there be two kinds. The white is purgatiue, and the * weight of a Roman denier taken in water doth euacuate cholerick humors. A liniment thereof together with bean flower applied vnto the hard kernils called the Kings euill, is a soueraigne remedie therefore, so that a Colewort leafe be laid thereupon. The other kinde is more blackish, and purgeth the head of ill humors. It cleneth the eyes and cleareth the sight. Taken in vineger it stayeth their brains that be troubled in mind: and drunk in wine, or eaten with a fig, it is singular good for the spleene. If a man take it fasting euery morning with hony, it cureth the cough. The seed drunke in wine expelleth all the wormes in the guts: which it doth more effectually if wilde Mints be ioyned withall. With Origanum and sweet wine it helpeth those that be short winded and troubled with the cough. The decoction thereof when it is foddren in goats milk, easeth the pains of the chest or breast. Laid to as a Cerot with pitch, it resolueth pushes and biles, yea and draweth forth pricks and thorns out of the body. A liniment applied with vineger, taketh off all spots and speckles of the visage: and if the white of an egg be put thereto, it cureth cancerous fores. Also being applied in forme of a soft vnguent to the spleene, it cureth the infirmities thereof: but if they be little infants that are troubled therewith, there must be honey also put thereto, and then is it excellent good. *Sextus* addeth moreouer and saith, that a perfume thereof burnt driueth away serpents, & resisteth the poison of scorpions: as also that being brused and applied with Senvie, it is a singular remedie for the head-ache, and to make haire grow againe where it was fallen off: also, being stamped into a cataplasme with a fig, and laid to the eares, it cureth the hardnesse of hearing. Likewise, if the juice thereof be infused or poured into the eares, it easeth the tooth-ach. Moreouer, a liniment made with it and goose-grease, scoures away the skales and dandruf, as also the scalls of the head. A cataplasme made of it and leuain, ripeneth fellons, bringeth carbuncles to suppuration, and breaketh them. With hony it mundifieth filthy corrosiue and cancerous vlcers that eat deepe into the flesh. A liniment thereof with barley gots and vineger is good for the Sciatica and the pains of the loins: in like manner it cureth ring-worms and tetrars: it mundifieth the roughnesse about the nailes, for it is of a caustick nature. The best Cresses are the Babylonian, and yet the wild are more effectuell than it in cases aboue named.

But Rue is an herb as medicinale as the best. That of the garden hath a broader leafe, and brancheth more than the wilde, which is more hot, vehement, and rigorous in all operations. There is a iuyce usually pressed out of it, being first stamped and sprinkled a little with water in the stamping, and then put vp into a box of copper or brasse, and there reserved for to be used as occasion serueth: this iuyce taken in a great quantity is a very poison and no better, especially that which is drawne out of the Rue which groweth in Macedony about the riuer Aliacmon. But wil you heare a strange and wonderful thing? the iuyce of Hemlock killeth this venomous qualitie of it. See how one poison is a countre-poison to another, inso much as if they annoint their hands with the iuyce of hemlock, who are to gather Rue, they shall not be inuened with it. And yet as venomous otherwise as Rue is, it goeth into the composition of those Antidotes which are giuen against poison, especially that Rue of Galatia. And to speak in general, there are none of these Rues, but the leaues both bruised alone and also taken in wine, serue for preseruatiues: and principally against the herb Aconite or Libard-bane, and the viscous gum of the herbe Chamæleon, which they call Ixias: likewise against deadly and venomous Mushromes taken at the mouth, whether it be by way of meat or drinke. In like maner it is singular good against the stinging of Serpents: for the very Weasels when they prepare themselves to combat with them, vse to eat this herbe before-hand for to be secured from their venome. Aunaleable it is also against the pricks of Scorpions and Hardi-shrewes, against the stings of Bees, hornets, and wasps, against the poison of the Cantharides and Salamanders, yea and the

biting

A biting of a mad dogge; if it be used in this wise, namely, to take a saucer full or acetable of the juice and so drink it with wine: also to stampe or champ in the mouth the leaues thereof, and to lay them vpon the grieved place with honey and salt, or else to seeth them with vinegre and pitch. Folke say moreouer, that whosoever is wel rubbed with the juice of Rue, or otherwise do but cary it about him, shall be sure ynough for being either pricked, stung, or bitten with any of those hurfull and venomous creatures abouenamed: furthermore, that Serpents naturally doe flie from the smoke or fume of Rue when it burnes, and will not come neer vnto it: but the most soueraigne of all other, and surest in operation is the root of the wild Rue, if it be drunke with wine. And the common speech goeth of it, that the greater and speedier effect will be seene, in case forsooth one drinke it without the house, in the open aire abroad. *Pythagoras* was of opinion, That there is a distinction of sexe in this hearbe, and namely, that the male hath smaller leaues, and those of a more darke and grasse green color than the female, whose leaues are both fuller and better fed, and also of a more pleasant and gaier hew. He was persuaded also that Rue is hurtfull to the eyes, but therein he was deceived. For well it is known, that engrauers, caruers and painters, doe ordinarily eat Rue alone for to preserve their eye-sight, they take it also with bread or Cresses, without any regard whether it be the wild or the gentle Rue of the garden: by report also, many haue used an inunction thereof to their eyes, with the best honey of Athens, and thereby cleared them quite of that muddines and mist which dimmed their sight, or else in stead of honey they haue taken breast-milke of a woman that lately bare a maiden-child: or no more but with the very pure juice of rue and nothing els they haue gently touched the corners of the eyes: others haue cured the waterie humor that hath taken a running thither, onely by applying the juice of Rue together with Barley groats. If a man drinke Rue with his wine, he shall find ease of his head-ach: or if he doe but annoint his temples and forehead therewith, beeing incorporat with vinegre and oile of Roses into the forme of a liniment. But if it be an old and inueterat pain of the head, then would there a frontale be made of the said juice, tempered with Barly flour and vinegre. Rue hath this vertue, to discusse and resolute all crudities and ventosities proceeding thereof, yea, and cureth the settled old paines of the stomack. It is of power to disopilate or open the matrice: to settle the Mother into the right place when it is loose & out of frame, in case a liniment be made thereof, and laid al ouer the region both of the womb and the breast. If Rue be eaten with figs, or foddren to the consumption of the one half-deale, & the decoction thereof taken in wine, it is good for the dropie. And in that maner they vse to drink it for the paines of the breast, sides, and loines: for coughs also and shortnesse of breath and generally for all griefes and maladies incident to the lights, liuer, and kidneies: and last of all, for the shaking cold fits in an intermitten ague. Is a man disposed to drink freely, and to sit square at it? let him before he beginne take a draught of the decoction of Rue leaues, he shall bear his drinke well, and withstand the fumes that might trouble and intoxicate his brains. In one word, used ordinarily at meat, either raw, foddren, or preserved and condite any way, it is singular good for the purposes aforesaid. Boiled with Hyssope and taken in wine, it is singular for to assuage the torments of the belly: and being so prepared, it restraineth the flux of bloud within the bodie: like as it stancheth bleeding at the nose, if it be stamped and put vp into the nostrils: and otherwise a collution thereof to wash the mouth withall, doth much good to the teeth. Semblably, the juice distilled into the eares, allaieth their pain; provided alwaies (as I haue often said already) that a mean and measure be kept. As for the juice of the wild Rue, if it be tempered either with oile of roses or of baies; or els mingled with Cumin & Honie, it helpeth those that are hard of hearing, & discusseth the ringing found in the eares. Moreouer, the juice of Rue stamped and drawne with vinegre, is excellent good to be infused or let drop from on high by way of Em brochation vpon the region of the brain and temples of the head, for the phrensie. Some put thereto wild running Thyme also and baies, therewith annointing the head and neck of the patient. Others haue prescribed it in case of Lethargie to those that can do no other but sleepe continually, for to smel vnto. And those haue giuen counsel also to them that be subiect to the falling sicknesse, for to drinke the juice thereof foddren in foure Cyaths of water, before the fit came on them: for to preuent and auoid the intollerable cold which they should endure: as also to those that be apt to * chill for cold, to be eaten with meat, raw Rue sends out euen the bloudie vrine, which is gathered into the bladder. And as *Hippocrates* is of opinion, if it be drunk with sweet thicke, and grosse wine, it causeth womens floures to come downe, it expelleth the after-

* Also, Some read *Alphios*, [out of *Disco-rid.*] that is, to them that are subiect to the white Mor-phew, which is a kind of Leprosie, or *S. Magnus* euil.

birth,

birth, yea, and the dead infant within the womb. And therefore he aduise women in trauel to haue those naturall parts annointed with Rue, yea, & to sit ouer a suffumigation made therof. *Diocles* maketh a cataplasme with Rue, Vinegre, Hony, & Barly floure, for faintings, cold sweats, and tremblings of the heart. Likewise, against the torments of the smal guts, commonly called the * Iliak passion, he appointeth to take the decoction thereof in Oile, and to receiue the same in lockes of wooll, and so to be applied vnto the vpper region of the belly. Many doe set downe two drams thereof drie, and one dram and a halfe of Brimstone, as an excellent receit to bee taken by those that reach and spit vp filthy and stinking matter: but if they cast or send vp blood, they should drinke the decoction of three branches thereof in wine. It is an ordinarie practise in case of the Dysenterie or bloudie Flix, to giue it stamped first with cheefe, in wine: but they mingle therewith Bitumen, and so crum or break it into their drink, against the difficultie of taking wind. Also three drams of the seed thereof is giuen in drinke to those that are fallen from a loft, for to dissolue the bruised and cluttered blood within them. *Item*, Take one ponnard or pint of oile, of wine one sextar or wine quart, seeth the leaues of Rue herin: that oile so prepared, is singular good for to annoint parts which are benumbed, and in manner mortified and blacke with cold. Moreover, considering that it is diuretical, as *Hippocrates* thinketh, and doth prouoke vrine; I cannot but wonder at some, who giue it as a thing that staith vrin, & therefore appoint it to be drunke by those that cannot hold their water. The innunction thereof with Allum and Hony, cleanseth the dry wild scab & leprosy. Likewise with Morel or Nightshade, hogs greafe and Bulls tallow, it scoureth the Morpheu, taketh away werts, discusseth and dispatcheth the Kings euil and such like tumors. In like manner it killeth the fretting hot humor called *S. Anthony's* fire, being applied to the place with vinegre, Honny, or Cerusse, i. white Lead: like as it cureth the Carbuncle laid too, with vinegre alone. Some there be who prescribe *Laserpithum* also to be joined with the rest in this liniment: but without it they cure the chilblanes & bloudy fals that be so angry in the night season. Many vse to boile Rue, & together with wax, reduce it into a Cerot, which they apply to the swollen breasts or paps of women, as also to the breaking out of phlegmatick pustules or wheales (much like to our measels or small pockes). Also being reduced into an vnguent with the tender sprigs or tops of Laurell, it is a singular remedy for the flux or fall of humors into the burse of the cods. And verily this Rue is counted so excellent an herbe in operation this waies, and so respectiue peculiarly to those parts, that it is commonly holden for a soveraign remedie to heale all ruptures, if a man take the wild of that kind and make a liniment of it and old Swines greafe together. Likewise, if any bones or lims be broken, a Cerot made with the seed of Rue and wax together, is able to foulder the fracture. The root of Rue being reduced into a liniment, cureth bloudshotten eies, and restoreth to the natie colour all skarres or spots that giue blemish to any part of the bodie. Among the other properties that be reported of Rue, this is one to be wondered at, considering how hot it is of nature (as all Physicians doe agree) That a bunch thereof being boiled in oile Roseate, and with one ounce of Aloe brought into the forme of an ointment, should repress their suet, who are annointed therewith. As also, that ordinarie vse thereof at meat should disabie folke aswel in the act of generation, as conception: In which regard it is prescribed vnto them that shed their seed: and vnto such as vse to dreame in their sleepe of amatoious matters and the delights of *Venus*. But women with child must beware how they eat Rue: they especially must forbear this herbe: for I find that it killeth the yong child conceiued within their bodies. Thus much for the effects that it worketh in men and women.ouer and besides all which, there is not an hearb growing in the garden that is so much vsed for the curing of 4 footed beasts, whether they be broken winded and pursue, or otherwise bitten & stung with venomous beasts; in which cases, there must be an injection made vp into the nostrils, of the juice of Rue in wine. Also, if it chance that a beast hath swallowed an Horseleech in drinking, let it be taken with vinegre. Finally, in euery accident of theirs, let Rue be prepared and ministred respectiue vnto each griefe, according to the manner set downe for men in the semblable case.

CHAP. XIII.

¶ Of wild Mint : of garden Mint : of Penyroiall : of Nep, and Cumin.

Wild Mint is called in Latin *Mentastrum*: it differeth from the other in the form of the leaues: * for shaped it is like Basil, how fouer in color it resembles Penniroyal, which

* All this agreeth to our Calaminthace, according to Dioscorides.

As the cause, that some name it the sauage Penyroiall. In the time of *Pompey* the Great, it was knowne by experience, that the leaues of wild Mint chewed and applied outwardly, cured the Leprosie: by occasion, that a certaine leper minding to disguise himselfe, that hee might not for very shame be knowne, chaunced to annoint and besmeare his face all ouer with the juice of wild Mints. But fortune was better mistresse vnto him than he expected, for beyond his expectation or intent, his good hap was to be rid of his Leprosie by that meanes. The same leaues serue for a liniment against the venome of Scolopendres, and the sting of Serpents: so doe they also, if one drinke two drams of the leaues in two Cyaths of wine. Also, for to cure the prickles of Scorpions, they bevsed with salt, oile, and vinegre. But against Scolopendres, commonly they drinke the juice or broth of the decoction. Moreover, the wiser sort of people saue the drie leaues of wild Mints to be reduced into a pouder, as a very coun trepoison against all venome whatsoeuer. For being strewed in the house, or burnt, the very air & perfume therof chafeth away Scorpions. A drink made therewith purgeth & putrifeth women passing well, such I mean as be newly deliuered of childbirth: but it killeth the fruit within the womb of as many as vse it while they go with child. There is not a medicine in the world so effectual, as it is for those who are so freight winded, that they cannot take their breath vnlesse they sit vpright: for such also as in the cholericke passion, neuer giue ouer casting vpward and purging downward. It appeaseth also the paine of the loines, and easeth the gout, if it be applied to the place affected. The juice thereof is good to be dropped into eares that haue worms within them. It is vsually taken in drinke for the launise. A liniment made thereof, helpeth the kings euil; besides, it is a singular remedie for them that by a strong imagination of *Venus* in their dreames, defile and pollute themselves in their sleep. If one drinke it with vinegre, it excludeth the flat broad in the bellie. To scoure away the fouled and druffe, an Embrochation of it ad vinegre vpo the head in the Sun is counted singular.

As touching garden Mint, as the very smell of it alone recouereth and refresheth the spirits: so the tast stirreth vp the appetite to meat, which is the cause, that it is so ordinarie in our sharp fauces wherein we vse to dip our meats. Being put into milk, it wil not suffer it to turn or sour, it keeps it from quailing and curding which is the reason, that they who vse ordinarily to drink milk, take Mints therewith, for fear it should coagulate or crudle in their stomack, & put them in danger of suffocation. Some, for the same effect vse to giue it in water or honied wine: and surely it is thought by that very propertie to hinder generation, in that it dissolueth the due consistence and thickenesse which is required in naturall seed. And yet it is a great stancher of blood indifferently in men and women: but more particularly it staith the immoderat flux of whites that many times followes women. Being taken with Amydum or starch pouder in water, it restrains the inordinate flux occasioned by the imbecility of the stomacke. *Syrion* the Physician vsed ordinarily to cure the apostumes and sores of the Matrice, with Mint. Also against the obstructions & other accidents of the liuer, he was wont to giue 3 Oboles thereof in honied wine. And for them that raught vp blood at the mouth, he prescribed to take Mints in a broth or supping. The skel that little children be troubled withal, it healeth wonderful well. It is singular to drie vp the humors that mollifie the gristly windpipe & the other instruments of the breath and voice, and when they are drie, knitteth and strengthneth them. Taken in water and honied wine, it clenseth the corrupt and putrified phlegmatick humors which be offensive to the throat and those parts. The juice of Mint is excellent for to scour the pipes & cleer the voice, being drunke a little before that a man is to strain himselfe either in the quier, or vpon the stage, or at the bar, and not otherwise. A gargarism of milk, wherein hath bin Rue & Coriander, besides mints, is passing good to bring down the swelling of the vula. Being vsed in that manner with some Allum, it restraineth the mumps or inflammation of the Amygdales: & with Hony it cureth the roughnes & furring of the tongue. Being vsed alone without any other addition, it is a proper medicin for inward convulsions, as also for the disease of the lungs. *Demonocrinus* saith, that to drinke it with the juice of a Pomegranat, is a readie means to stay the yex & vomiting. The juice of greene Mints, drawne vp with the wind into the nostrils, helpeth the stinking vlcers there. The herbe it selfe stamped, represseth the rage of choler that purge th both waies vncessantly, but it must be drunke with vinegre. And in that maner it restrains all internal fluxions of blood. But applied outwardly with Barly grots to the griued place, it easeth the intollerable paine of the Iliak passion: after the same sort if it be spread and emplaistered, it allaieth.

allaieth the swelling of womens breasts. In case of head-ach, a liniment thereof doth well to be applied to the temples. Inwardly it is taken with very good effect against the venomous Scorpions, the sea Scorpions, and other serpents. A liniment thereof staieth the waterish humors that haue taken a course to the eies, cures the skalls and breakings out of the head, and all accidents offensive to the tiwill or fundament. If one doe hold Mints in his hand, he shall not need to feare either chafing or galling in any part, vpon trauell. Beeing dropped into the eares with honied wine, it is very comfortable to that part. It is said moreover, that if a man come into a garden where Mints groweth, and bite the leaues vpon the very plant, without plucking or cropping it off, and continue this course 9 daies together, iterating euermore these words [*I doe this to cure the spleene*] he shall find remedy indeed for the infirmity of that part: moreover, let one take as much powdered mints dried as he can well contain with his 3 fingers ends, and drink the same as much powdered mints dried as he can well contain with his 3 fingers ends, and drink the same spiced with the said powder, it will driue out of the belly the wormes there engendred.

The branches of Mint and penniroiall both, are vsually put into glasse viols with vinegre, for to be infused therein: and a man would not thinke how good this vinegre is for faintings of the heart; so great is the societie that these two herbs haue one with the other in this behalfe. For which cause, I remember on a time when diuers learned physicians were met together to confer in my chamber, they resolved and concluded definitely, That a chaplet of Pennyroyall was without comparison far better for the giddinesse and swimming of the head, than one of roses, for a garland of Pennyroyall, if it be worn onely vpon the head, allaieth (by report) the ach thereof. More than it, it is said, That the very sent of Pennyroyall preferueth the brain from the offence that may come by the distemperature either of heat or cold, yea and from the inconuenience of thirstinesse, in so much as whoeuer haue two branches or sprigs of Pennyroyall put into his ears, shall feele no accessiue heat though they continued in the Sun all the day long. Pennyroyall being applied in form of a liniment, together with Barly groats and vinegre, assuageth all grievous paines whatsoever. Howbeit, the female of this kind is thought to be of greater operation euery way, than the male. Now hath this female a purple floure, that you may know it thereby from the other, for that of the male is white. The female Pennyroyall taken in a mash made with salt and barley groats in cold water, staieth a kecklish stomach, and keepeth it from the inordinat desire and many offers to cast. In the same manner also it easeth the paine of the breast and belly. Likewise the gnawings of the stomach it ceaseth, being taken in water; as also immoderate vomits it represseth, with vinegre and barley groats. Being sodden in hony with a little nitre among, it cureth the maladies of the guts. If one drinke it with wine, it causeth abundance of urine; and if the said wine be made of the Ammian grapes, it expelleth the stone and grauell, yea and all things els which may engender inward pains. If it be taken with honey and vinegre, it prouoketh womens termes, and quieteth them when they lie gnawing and fretting inwardly, yea and sendeth forth the after-burden. The same setleth the mother and reduceth it into the right place. It expelleth also the dead child within the mothers body. The seed of Pennyroyall if it be smelled vnto, is singular good to recouer their tongue againe who be speechlesse: for the falling sicknesse also, it is giuen in a cyath of vinegre. If it fortune that one must drink vnhole-some waters, the seed thereof reduced into powder and strewed therupon, correcteth all the mafe-lice thereof. If the same be taken in wine, it slaketh the itch in the bodie proceeding of hot and salt humors. The seed of Pennyroyall, mingled with salt, vinegre, and honey, if it be well rubbed into the bodie, comforteth the sinewes in case of cramps and convulsions: and particularly helpeth those who with a crieke are forced to carrie their necke much backward. The decoction thereof is a soueraigne drinke against the sting of Serpents; and particularly of Scorpions, if it be bruised and taken with wine: especially that which groweth in drie places. Moreover, Pennyroyall is held to be very soueraigne for the cankers or vlcers in the mouth, and as effectual to stay the cough. The floures of Pennyroyall that be fresh and new gathered, if they be burnt make a singular perfume to kill fleas. Among many good receipts that *Xenocrates* hath left vnto vs, we find this for one, namely, That a branch of Pennyroyall wrapped within wooll, and giuen to the patient for to smell vnto before the fit come of a tertian ague, driueth it away: as also if it be put vnder the couerlet of the bed, and the Patient laid vpon it, it doth no lesse. For these purposes abouenamed, the wild Pennyroyall is of most efficacie: This hearbe resembleth Origan, and hath smaller leaues than the Pennyroyall of the Garden: some giue it the name of *Dictamnus*. If it chance

A chance that either sheepe or goats do tast thereof, it prouoketh them presently to blea: wherupon certain authors, changing one letter for another in Greeke, call it * *Balsam*. This herb is so hot and ardent, that if any part of the body be rubbed or annointed therewith, it will rise into a blister. If one haue taken a through-cold, and thereby gotten a cough, Physicians haue prescribed to vse frictions therewith before the Patient go into the bain for to sweate. Also their direction is to do the like before the cold fits of agues: as also in case of the crampe and torments of the guts. Wonderful good it is in all kinds of gout. If it be taken in drinke with honey and salt, it is singular for those who be diseased in the liuer, as also for the lights: for it opens their pipes, and dischargeth them of the flegme that stuffed them, so as they may reach vp and voyd the same with ease. The decoction thereof with some salt is excellent good for the spleene and the bladder, yea and for all ventosities and shortnesse of breath. Semblably, the iuice prepared and dressed in maner aforesaid, bringeth the mother into the naturall place; and serueth as a countre-poison against the Scopolendre both of the sea and the land: as also for the pricke of the scorpion, & especially against the biting of man or woman. The root thereof being applied fresh and green, is marvellous good to repress rank vlcers, & to consume the proud flesh about them. The same being dry and so applied, reduceth skars to their fresh colour and beautie of the faire and whole skin. Thus much of Pennyroyall of the garden and the field.

Great conformitie there is in operation between Pennyroyal and * *Nep*, for being both boiled in water vnto the composition of a third part, they discusse and shake off the cold in Ague fits which causeth the Patient to shake; and besides are of validitie to bring downe womens C monthly sicknesse. In summer time they assuage the extremities of heat. *Nep* also is powerful against serpents, for the smoke and perfume of this herbe they cannot abide, but will fly from it: which is the cause that such as be afraid of serpents, strew *Nep* vnder them in the place where they mean to repose and sleepe. Being bruised and applied to the running fistulous vlcers between the nose and the greater corner of the eye, it is counted a soueraigne remedie. Also being fresh gathered, and mixed with a third part of bread, and so temperat and incorporat with vinegre to the form of a liniment, it cureth the head-ach. The iuice thereof being infused into the nostrils whiles the Patient lieth vpon his back, stancheth bleeding at the nose. The root also, together with Myrtle seed, in warm wine cuit, and so gargarised, helpeth the Squinancie. As touching wild Cumin, it is an herb exceeding small, putting forth foure or fise leaues, and not above, and those indented like a saw: but the garden Cumin is of singular vse in physicke, but principally for the pain in the stomach. It dispatcheth the grosse vapors arising from flegme; it dissolueth also ventosities, if it be either bruised and eaten with bread, or drunk with water and wine; in which sort it assuageth the wringing torments and other pains of the guts: howbeit it maketh folke look pale, as many as drink of it. Certes by that deuise, namely by ordinary drinking of Cumin (as it is reported) the schollers and followers of *Porcius Latro* (that famous and great Rhetorician) procured themselves pale faces, because they would look like their master, who indeed came to that colour by continuall study and plying his booke. Thus likewise not long since, *Julius Vindex*, being desirous to be affranchised by *Nero*, pretending by his pale visage and poore look, that he had not many daies to liue, made faire semblance vnto *Nero* by his will and testament, that he should shortly be his heire (which cheat the said *Nero* gaped after,) and so by that means *Vindex* entred so far within him, as hee obtained whatsoever he would at his hands. Cumin reduced into the form of trochisks or * nose-tents, put vp into the nostrils, stancheth bloud. The like effect it hath, being fresh gathered and applied with vinegre. Being layd it selfe alone to watering and weeping eies, it restraineth that humour: and in case the eods be bolne or swelled, it is good to mix honey withall in manner of an emplastre. But it sufficeth to make a cataplasme thereof and lay it to the belly alone, of little babes and infants so troubled. Finally, to cure the jaunise it is singular, giuen in white wine when the Patient hath sweate, and is come out of the Baine.

CHAP. XV.

F ¶ * *Of Cumin Ethyopick, which restraineth the flux of urine: of Capres: of Lorach or Panax: and of a kind of Marjerom named Cunila-bubula.*

B Vt for the purpose aforesaid, namely to cure the jaunise, the Ethyopian Cumin is the best, being taken after a bath with vinegre and water: also licked in maner of a Loch with hony.

* It seemeth that this Title is corrupt

* called *Erythrina* or *Nasturtium*

* For *247*

* or *Calemintha*

As for the Cumin of Africk, it is thought to haue a singular proprietie by it selfe for to helpe those who cannot contain and hold their vrin. The garden Cumin, if it be parched drie, brought into powder, and giuen in vinegre, helpeth the defects and infirmities of the liuer: also it cureth the dizziness of the head. But in case the acrimonie or sharpnesse of the vrin be such, as that it fret and moue smart in the passage, the powder hereof would be tempered in sweet wine * cuit. For the impediments of the matrice it ought to be drunk in pure wine of the grape, and withal there must be applied to the place offended, a cataplasme of the leaues vpon a lock of wool. Dried against the fire, bruised and beaten into powder, and so incorporat with oile of roses & wax, and wrought in the end to the form of a Cerot, and then applied, it abateth the swelling of the cods. But the wild Cumin is more effectuall in all the cases aboue mentioned, than that of the garden.ouer and besides, it hath a speciall vertue together with oile, against serpents, scorpions, and Scolopendres. Take as much of Cumin seed as you may comprehend within three fingers, drink it in wine, it wil stay immoderat vomit, yea and the sick heauing of the stomacke, as if it would cast and cannot. A drinke made therewith is giuen also for the colique: and to that purpose a liniment thereof is very commendable, or if it be applied hot in quilted bags, so that the same be kept swaddled down vnto the region of the gut Colon. For a woman that is giuen to the rising and fuffocation of the mother, let her drink it in wine after this proportion, Three drams of Cumin to three cyaths of wine, she shall find that it will resolute those vapors and fuffosities which caused the foresaid maladie. With calues tallow or sewer, or with honey, if it be let drop into the eares, it cureth the founding and tingling therein. Being applied as a liniment, with hony, raisons, and vinegre, it resolue the blacke and blew markes remaining after stripes. Also with vinegre alone it cureth the black spots and speckles appearing in any part of the body, if the place be bathed therewith.

An herb there is resembling Cumin for all the world, which the Greeks cal Ammi: although some there are who thinke it to be all one with the Cumin of Etyopia. Hippocrates calleth it, the roial Cumin [of Egypt:] the reason was, no doubt, for that he deemed that of Egypt to exceed all the rest in goodnes. But most writers besides him do thinke it * an herb altogether of another nature, because it is smaller and whiter: and yet it serueth to the like vse: for at Alexandria in Egypt they put it commonly vnder their loaves of bread in the bottom crust, when they go to the oven, and ordinarily it is occupied in the kitchen about saucis. Be it what it will, it dissolueth ventosities, it pacifieth the wringing torment of the guts, it prouokes vrin, and bringeth down womens moneths. Being taken in wine, together with Linseed, to the quantitie of two drams, it cureth the venomous stings of scorpions: but put thereto an equall quantitie of myrrh, it hath a singular vertue against the horned serpent Cerafies. And, like to the other Cumin before named, it altereth the colour of as many as drink of it, and makes them looke pale. A suffumigation made thereof, with raisons and rosin, mundifieth the matrice & natural parts of women. Finally, it is commonly said, That if a woman smell thereto in the very act of generation, she shall conceiue the rather by that means.

As for Capres, we haue sufficiently written thereof amongst other shrubs that be strangers: and yet it wil not be amisse to reiterate thus much, That a man must be well aduised how he taketh any outlandish Capres that come from beyond-sea: but if he wil go safely to work, let him hardly keep him to those of Italy, for they are lesse harmelesse than the other: for if all be true that is commonly reported, whosoever daily eat Capres, shall not be in danger either of palse or pain of splene. The root of capres is singular good to take away the white spotted morpheue (cousin german to the leprosie) in case it be stamped, and the place affected rubbed therewith. Take the rind of the root, the quantitie of two drams, and drink it in wine, it helpeth the swelled splene; provided alwaies, that the Patient forbear the vse of baines and hot houses: for, by report, this course continued 35 daies, will cause the said splene to purge away, partly by vrine, and partly by seege. The same if it be taken in drink allaieth pain in the loins, & cureth the palse. The seed of Capres sodden in vinegre, bruised & applied to the teeth, or otherwise the root thereof chewed only, assuageth the tooth-ach. A decoction of Capres in oile instilled into the eares, mitigateth their pains. The leaues and the root newly gathered, and so applied as a Cataplasme with hony, healeth the corrosiue vlcers that eat to the very bone. Likewise the root resolues all those glandulous swellings which we name the Kings euil: and if the same be sodden in water, it discusseth the tumors behind the eares, and riddeth away the worms breeding within.

It

* In dulci: hec
n. caneth pas-
sum.

Rue'sm takes
it for Basil
gentle.

A It cureth also the infirmities of the liuer. The manner is to giue the same in vinegre and honey for to chase away the vermin engendred within the guts. Boiled in vinegre, it is singular for the cankers or exulcerations within the mouth: howbeit, all authors doe accord, that they bee not good for the stomacke.

Touching Louage, which some call Panax, it is * hole some for the stomack. Likewise a proper medicine it is for convulsions and ventosities. To conclude, there are some who name it Cunila Bubula, as I haue before noted, but they be deceived.

C H A P. XVI.

B ¶ Of the wilde Origan Cunila Bubula: of the Bastard Atarjoram, named Gallinacea
Cunila, or Heracleoticum Origanum: of the tender Cunilago: of Rosmarie:
of Garden Saurie or Cunila, and that of the mountaines.

O Ver and besides the garden Saurie, there be many kinds of Cunila known in Physicke: and first that which is called Bubula, and hath seed like to Peniroiall, being either chewed in the mouth or applied outwardly, it is a good wound-hearb, so that it be not remoued but euery fife daies. Taken in wine, it is singular against the poisonous sting of serpents, in case the hearbe it selfe be stamped, and laid withall vpon the fore place: and verily it is an ordinarie thing, to rub therewith well and thoroughly, the wounds that they make. Semblably, the Tortois, against the time that they should fight with Serpents, vse this hearbe in manner of a defensatiue, & take themselves well armed against their enemies: which is the reason, that some giue it the name of Panax. Being dried, it assuageth the pain of tumors, and cures the accidents that befall to the priue members of men: or if the leaues be but stamped, they haue the like effect. And in one word, the operation thereof is excellent and wonderfull, if it be vsed in wine.

Another Cunila or Saurie there is, which our countrey men call in Latine Gallinacea; the Greekes name it Origanum Heracleoticum. If it be braied and salt joined thereto, it is soueraigne for the eyes: it helpeth the cough also, and correcteth all faults of the liuer. If a thicke grewell or few be made thereof, together with floure, oile, and vinegre, so tempered as it may be supped, it cureth the pleurisie or paines of the sides: but aboue all, it is singular for the stinging of Serpents.

D A third kind there is, which the Greeks tearme the male, but we in Latin * Cunilago: a stinking smell it hath with it, a woodie hard root and a rough leafe: but it is generally said, that the operations thereof be more effectuall, than of any other kind. It is verily thought, that if a man cast an handfull thereof from him into any part of the house, all the moths and such like vermin will gather about it. But to come to particulars, It hath a singular power against Scorpions if it be taken with water vinegre. Also if a man or woman take 3 leaues thereof, and rub his bodie thoroughly with it and oile together, there is not a Serpent so hardie as dare approach neare such a bodie so perfumed. Contrariwise the Cunila, which is named Mollis, [i. d. soft] hath leaues and branches more hairie than the former, and those sharpe pointed like prickles. This hearbe if a man rub betwene his fingers, resembleth honey in smell, and will sticke fast too in manner of honny. Another sort there is of Cunila, which we, for the smell that it hath of Frankincense, call Libanotis. But both these, the one as well as the other, taken in wine or vinegre, cureth the biting and sting of Serpents. If they be bruised or stamped into powder, and so put into water, they kill all the fleas in the place where the said water is cast or spinckled. As for the garden Saurie, it also hath many good properties: The iuice thereof with oyle of roses distilled into the eares, is very comfortable vnto them. The hearb it selfe taken in drink, helpeth those who are stung with venomous Serpents. This Saurie oftentimes doth degenerat into a bastard kind, named Mountain Saurie. Like it is to wild running Thyme, and is effectuall against the poyson of serpents. It prouoketh vrin, and purgeth women newly deliuered, if haply they haue not sufficient voidance. Singular it is for to help digestion, and stirreth up appetit to meat wonderfully. In summe, as well the gentle Saurie as the wild, is passing whole some for crudities in the stomacke, if one spice his morning draught therewith fasting. It is vsed also to very good purpose in dislocations and members out of joynt: with barley meale, water, and vinegre, it is excellent for the stinging of waspes, and such like prickles. As touching the other kinds of Libanotis or Rosmarie, write I will more fully in due place.

* Fica-bani

CHAP. XVII.

¶ Of *Piperitis* and *Origanum*: of *Onitis*: *Praesium*: of *Tragoriganum*, and *Heraclium*: of *Lepidium* and *Gith* or *Melanthium*: of *Annise*.

* Ginney pepper.

Canila.

Piperitis or Calicut Pepper-wort (which before we called * *Siliquastrum*) beeing taken in drinke, is very good for the falling sicknesse. *Castor* hath described it after another manner, namely, to be an herb rising vp with a long red stem, thicke set with joynts or little knees; bearing leaues resembling those of Lawrel; with white seed and the same smal, carying with it the tast of Pepper. The vertues of which hearb be these; To help the gumbs and teeth, to make a sweet breath, and withstand soure and stinking belches.

Organ or Origanum, which in tast (as we haue said) resembleth * *Sauery*, hath many kinds, & all medicinable, for there is one fort thereof surnamed *Onitis* or *Praesium*, not vnlike to hyssope: a peculiar propertie this hearb hath being drunke in warme water, to quiet the gnawings in the stomacke, and to concoct the crudities there: but taken in white wine, to cure the venomous pricks of Spiders and Scorpions. The same applied outwardly with oile and vinegre vp-on wooll, is singular good for dislocations, disjointsures, spraines, contusions, and bruises.

As for *Tragoriganum*, it is more like vnto wild creeping Thyme: it hath vertue to prouoke vrin, to discusse and resolueth all tumors or swellings. And more particularly, most effectually it is for them that haue drunke the gum of *Chamelæon*, called *Ixia*: also against the Vipers sting: besides, for the stomacke that belcheth soure, and for the midriffe and preordiall parts. It is an approued medicine for the cough, the phrensie, and inflammation of the lungs, being with honey reduced into the forme of a Lohoch, for to be sucked downe leisurly.

Touching the *Origan* named *Heraclium* or *Heracloticum*, the same also is diuided into three sorts: For the first is of a blacker & more dusky green, with broader leaues: also than the rest; and besides is glutinous and will cleaue to ones fingers. A second sort hath smaller leaues, softer it is & more tender in hand, not vnlike to *Majoram*; and this kind some would rather call *Praesium*. The third hath leaues of a mean bignes between the other two, nor so large as the one nor so slender as the other, but not so forcible in operation as either of them both: but to return againe to our former *Origanum*: the best is that which groweth in Candy; for the same hath a pleasant and sweet sent besides: the next in goodnes is that which commeth from *Smyrna*: then after it, is the *Origan* that is brought from *Heraclia*: but that which is surnamed * *Onitis* is sim-
mon, is to chase away serpents: by way of decoction or portage made thereof, to cure them that be already stung or wounded by them: beeing taken in drinke, to moue vrine: and, together with the root of *Panace*, to helpe ruptures, convulsions, and spasmes: foddren in certaine *Acetables* with figs or hyssope, to the consumption of a sixth part, to cure the dropie. At the entrance into the stouue or hot-house if it be taken good it is against the scab, the iteb, & the wild skurf. The iuice with milk, is dropped into the ears, and that with very good successe. It helpeth also the mumps or inflammation of the *Amygdales* and *Vvula*; likewise the vlcers in the head. The decoction thereof taken with lie ashes in wine, is a countrepoyson to kill the venom of *Opium* and *Plastre*. The measure of one *Acetabell*, looseth the belly. A liniment made thereof, recovereth the native colour of the blacke and blew marks remaining after stripes. With hony and nitre, it assuageth the paine of the teeth if they be rubbed therewith: and besides maketh them looke faire and white. It stauncheth bleeding at the nose. A decoction made therewith and barley meale, resolueth the swelling kernells and inflammations behind the eares. The pouder beeing incorporat in honey and gall-nuts, dorth smooth and cleare the rustinesse of the windpipes, occasioned by a rheume. The leaues applied in manner of a cataplasme with honey and salt, mollifieth the spleene. If the hearbe be foddren with honey and salt, and so taken by little and little, it doth cut, extenuate and make subtil, grosse fleagme, especially if blacke melancholy be bedded therein. Stamped, and instilled into the nostrills with oile, it cureth the iaudise. Such
as be ouerwearyed and tired with extreme trauell, find much alleviation and ease by being rubbed and anointed all ouer with a liniment made thereof, with this caveat, That they come not so neer as to touch the belly with it. A plastre made with it & pitch & applied, healeth the angry bloody-falls & chilblanes, Bruised with figs, it ripeneth felons. A pulues made with it, with
oile,

* Bugle, or
Stachas Arabica.

A oile, vinegre, and barley meale, softneth and resolueth the Kings euill. A liniment made therewith and figs together, assuageth the paine of the sides. Being bruised and reduced into a liniment with vinegre, and so laid to the priuy parts, it restraineth the flux of blood thither; and yet it hath a propertie to euacuate the reliques of blood in women newly brought to bed, who ought to be purged.

As touching *Lepidium* [*Passiflora*] it is to be ranged among the burning and causticke medicines: by which faculty that it hath, and by blistering the skin, it taketh away any spot or blemish in the face; yet so, as the exulceration which it causeth, may be soone helped and skinned again with a salve of wax and oile of Roses. By the same means it serueth to cleanse the leprosie and wild scabs, which it doth alwaies with ease and expedition, as also to smoothe the cicatrices or scars after vlcers. Moreover, it is commonly said, that if it be tied fast vnto the arme on that side where the teeth do ake, it * taketh the pain quite away.

Gith or *Nigella*, the Greeke writers some name *Melanthion*, others *Melaspermon*: the best is that which is blackest, and besides of quickest sent. A singular remedie it is for the sores and wounds occasioned by venomous serpents and scorpions especially, if a liniment be made of it, vinegre and hony mingled together. I find also, that if it be burnt, the very smoke and fume of it will chase away serpents: but particularly against the poison of venomous spiders, a dramme thereof is sufficient to be taken in drinke. Being bruised and knit in a linnen cloath, and so smelled vnto, it resolueth the poyse, or breaketh the cold which stuffereth the nostrills. Applied as a liniment with vinegre to the forehead, or infused into the nostrills, it easeth the head-ache. And if it be soyled with the oile of the floure de-lis root, it staith the waterish humors that fall into the eies, and abateth their swellings. The decoction thereof in Vinegre cureth the tooth-ache, if a collusion thereof be made and the mouth washed therewith. Being stamped and so applied, or but chewed in the mouth, it healeth the cankers or exulcerations within. Likewise a liniment made of it and vinegre cleanseth the leprosie, and the hot red pimples breaking out in the skin. If it be taken in drinke, with some addition of nitre, it easeth the difficulty of breathing in such as blow short. It helpeth all hard swellings, and old festred impostumes or biles, if they be anointed therewith. If a woman be desirous to haue store of milk, let her eat and drinke thereof continually every day. As touching the iuice of *Gith*, it is drawn & gathered after the like maner as *Henbane* iuice. And semblably taken in any great quantity, it is a very poison: which
D is a thing to be maruelled at, considering that the seed thereof seasoneth loaves of bread, & giueth a most pleasant relish to them. Moreover, the seed of *Nigella* cleanseth the eies, prouoketh vrin and the monthly terms in women: yea and more than so, I read, that thirty grains thereof tied in a linnen cloth, and applied to a woman newly deliuered, will draw down the after-birth. They say also, that if it be stamped in vrin and laid to the agnells or cornes of the feet, it cureth them: as also that the smoke killeth gnats or any other flies.

As for the herb *Annise*, if it be drunk with wine it is a counterpoison against scorpions. And *Pythagoras* hath giuen a speciall praise and commendation to it both raw and boiled, as to few other herbs the like: for be it green or dry, it serueth as well for seasoning of all viands, as making all sauces, inasmuch as the kitchen cannot be without it.ouer and besides, when bakers set into the oven, they put *Annise* between the bottom of their loaves and the peece. And for to commend wine, Vintners vse to put it into their *Hippocras* bag, through which they strain *Hippocras* and other aromaticall wines: and indeed with bitter almonds, it giueth a pleasant and delicate tast vnto any wine whatsoever. If one chew it euery morning vpon an empty stomack fasting, together with the seed of *Smynum* and a little hony, it maketh the breath sweeter, and taketh away all stinking fauours about one; provided alwaies, that the mouth be presently washed with a collusion of wine. It causeth one to look fresh and young, if it be hanged about the bed vpon trauers or curtain, or otherwise stuck to the pillow or bolster, so as folke may haue the sent thereof in their nostrills while they lie asleep, it riddeth them of troublesome dreams and fantastical visions. It procureth a good stomack to meat: for so our idle, nice, and delicate
F wantons, euer since they haue giuen ouer exercise and trauell (which should get them an appetite & stomack to their viuals) & betaken themselves to sit still and do nothing, haue deuised this artificial means among others, & haue recourse to *Annise*: in which regards and for these causes, some haue giuen it the name of *Anicetum*. The best of all commeth from *Candia*: the next to it is that of *Agypt*; and indeed this serueth in stead of *Loveach* in all sauces. If a per-
sume

* To wit, by
raising a blister,
and gi-
uing issue,

sume thereof be drawn vp into the nose, it appeaseth the head-ache. *Iollas* saith, that the Anise root bruised and stamped together with Vine, and so applied, stayeth the flux of waterie and weeping eies. The herb it self, with an equall quantitie of saffron and wine, yea, or braied alone with barley grots, restraineth all great fluxions and distillations: and the same composition applied to the eyes, driueth out any thing that hath fallen into them. A liniment made therewith and water together, consumeth and cureth the Polypes or cankerous vlcers within the nostrils. A collution of it in vinegre, with honey and hyssop, vsed as a gargisme, asswageth the squinancie. Tempered with oile of roses it is soueraigne for the eares to be infilled into them. Being taken dried and parched at the fire, it clenseth the brest of the viscous and tough flegme there gathered; but if it be incorporat with honey it doth the deed the better. But would you learn for the cough a soueraign lohoch or confection? Take one Acetabell of Annise, and fifty bitter nuts wel clenfed and blanched: stamp these all together in a mortar, and with hony reduce them into the consistence of an Electuarie. And yer there is one Composition more for this purpose, and of all other the easiest and soonest made. *Recipe*, of Annise three drammes, of Poppy seed two drams, temper these with hony, & for three mornings together take the quantitie of a bean fasting. And this confection is singular besides against soure risings or belching: and therefore it cureth the ventosities which puffed vp the stomacke: it asswageth the torments and wrings of the guts, and represseth the continual flux proceeding from the weaknesse of the retentive facultie in the stomacke. But to return againe to simple Annise seed, a drinke made with the decoction thereof, or the very smell taken vp into the nose, stayeth the troublesome yex or hooquet. The decoction of Anise leaues doth digest and resolueth all crudities. The iuyce drawne from it when it is sodden with parsley, if it be smelled vnto, stineth immoderate sneezing. Moreouer, Annise taken in drinke, procureth sleep, expelleth the stone and grauel, stayeth vomits, and resolueth the tumors in the precordial parts, caused of windinesse. Further, it is a most soueraign medicine for the diseases in the brest: comfortable also to the neruous parts, membranes, and ligaments, wherein the muscles of the body be either inclosed or tied and vnited together. The iuyce of it being boiled with oile, and so dropped or infilled into the head, is good for the pains thereof. It is thought that there is not a better thing for the belly and the guts than Annise: and therefore it is giuen ordinarily (if it be first parched and roasted against the fire) in case of the bloody flux and exulceration of the guts: also for the inordinate profers to the siege, & rising from it without effect or any thing discharged. Some put thereto Opium also, and prescribe to make three pills thereof to the bignesse of a Lupine seed, and to take them euery day dissolved in a cyath of wine. *Diuenches* vsed commonly the iuyce of Anise, to mitigate the pain of the loins: to giue also the seed beaten to powder with mints in wine, for the drowy and the defluxion stomachicall: but the root he thought to be passing good for the kidneyes, vsed and taken in that maner. *Dalio* that famous Herbarist was wont to apply Annise and Parsley together in forme of a cataplasme, to women in labour, for better speed in child-birth: also for the pain of the Mother, yea, he would giue it also to drinke with Dill, vnto women when they cried out in trauell. He applied it also green, with barley grotes in manner of a liniment, to the head, for to stay and settle the brains of phrentique persons. And being so prepared, he found it singular good for young infants subiect to the Falling-sicknesse, or troubled with crampes and contractions of sinewes. As for *Pythagoras* verely, he saith confidently, That whosoever doe but hold this hearbe in his hand, hee shall not be surprised with a fit of the Falling-euill: and therefore he aduise men to sow good store of it in their gardens about their houses, to be ready euer at hand. He affirmeth moreouer, that women in labour, if they smell thereto, shall haue more speedy and easie deliuerance. Hee giueth counsell besides, That immediately after the childe is borne, the mother should drinke a growell made with it and some barley grotes strewed among. *Sosimenes* the Physitian was wont to mollifie and resolueth all hard swellings with Annise & Vinegre: he vsed also to giue the decoction thereof in oile, with some sprinkling of Nitre among, to those that felt weatinesse in their lims. Moreouer, hee assured trauellers and wayfaring men, that if they drank the seed thereof, they should find present help if they were tired. *Heraclides* gaue ordinarily of the seed as much as might be taken vp with three fingers, together with two oboles of Castoreum, in honied wine, for the hoving & inflation of the stomacke: semblably, for the puffing vp and swelling of belly and guts. Also, to those that were streit winded, & could not take their breath but sitting vp right, he ministred the like

pro-

A proportion; to wit, as much as three fingers would contain, with equall quantitie of Henbane seed, in Asses milke. Many Physitians giue counsell to those that would vomit lustily, for to drinke in water as they sit at supper, an acetabell thereof and ten leaues of Baies, bruised and beaten into powder. If Annise seed be chewed, or applied hot in forme of a liniment, yea, or taken as a drinke in vineger and hony, together with Castoreum; it helpeth the rising of the mother and the danger of suffocation thereby. If a woman in child-bed presently vpon her deliuey, drinke it with cucumber seed & line-seed together, of equall quantitie, namely, as much as may be held between 3 fingers, in three Cyaths of white wine; it will fertle the lightnesse of the braine, and stay the dizziness of her head. *Thiopolemus* prescribed for feuers quartane, as much Annise seed as three fingers might comprehend, with the like quantitie of Fennell seed to be taken in vineger and one Cyath of Honey. A liniment made with Annise and bitter nuts, allaieth the grievous pains of the gout. There be who are of opinion, That it hath a speciall vertue and property to resist the poison of the Aspis. Certain it is that it prouoketh vrine, allaieth thirst and the appetite to drinke, yea, and solliciteth to carnal lust. Taken in wine, it gently putteth forth a kind sweat. Moreouer, it keepeth cloths and apparel from the Moth. Generally, the fresher and newer alwaies that it is, and the blacker that it looketh, the more effectuell it is found to be. Howbeit, this one discommodity it hath, That it is an enemy to the stomacke, vnlesse haply it be peppered with ventosities.

C

CHAP. XVIII.

¶ Of Dill: of Sacopenium, and Sagapenum. Of Poppy both white and black. The manner of gathering and drawing iuyce out of herbes. Also of Opium.

Dill also hath a property to dissolue ventosities, to break wind and cause rising; also to assuage any wrings or torments of the belly, & yet it staieth the flux. The roots being reduced into a liniment with water or wine, restraineth the flux of watering eies. A perfume made of the seed as it boileth, receiued vp into the nostrils, staieth the yex. Taken as a drinke in water, it concocteth crudities, and appeaseth the pain of windinesse proceeding from thence. The ashes of it burned, raise vp the Vvula in the throat that is fallen. Howbeit, Dill dimmeth the cie-sight, and dulleth the vigor of genitall seed.

D

As for our Sacopenium here in Italy, it differeth altogether from that which grows beyond sea. For the outlandish kind, resembling gum Ammoniack, is called Sagapen. Good it is for the pleurisie and pain of the brest, Convulsions or Spasmes, and old settled Coughes; for those that reach vp filthy and rotten matter; for the tumors of the midriffe and precordial parts. It cureth the swimming and giddinesse of the head, the shaking and trembling of the joints, the crampe or convulsion that draweth the neck backward, the great swelled spleens, the pain of the bones, and all shaking and quivering colds. A perfume made therewith in vineger, if a woman smell vnto, it helpeth the Mother that is ready to stop her wind. As for the other accidents, it is both giuen in drinke, and also rubbed into grieued parts with oile. It is thought to be soueraign also against poysoned drinckes giuen by Witches and Sorcerers.

E

Touching garden Poppie and the seuerall kinds thereof, I haue written already: but besides them there be other sorts also of the wild, whereof I promised to treat. Meane while, the heads of the foresaid garden white poppy, if they be bruised whole as they grow with seed & all, and so drunk in wine, do procure sleep. The seed it selfe alone cureth the Leprosie. *Diagoras* giueth counsell to cut the stem or stalk of the blacke Poppy when it beginneth to strout and swell toward the flourishing time, out of which there wil issue a certaine iuyce called Opium: but *Iollas* aduise to make that incision when it hath bloomed, and to chuse a faire cleare day for it, & that houre of the day when as the dew thereon is dried vp. Now would they haue them to be cut vnder the head before the bloom; but in the very head, after it hath don flourishing, and verily, there is no other kind of herb wherein the head is cut, but this only. The said iuyce of this herbe as well as of all other is receiued in wooll: or else if it run but in small quantitie, they gather it with the thumbe naile, as the maner is in Lectuces: but the morrow after the incision, so much the more vigilant they must be to saue & gather that which is dried: and in very deed the iuyce of Poppy commonly runneth out in great abundance, & gathereth into a thicknesse: which afterward is stamped and reduced into little trofches, and dried in the shade. Which iuyce thus drawne

drawne and thus prepared, hath power not only to prouoke sleep; but if it be taken in any great quantity, to make men dye in their sleep: and this our Physitians call Opion. Certes, I haue knowne many come to their death by this meanes; and namely, the father of *Licinius Cecinna* late deceased, a man by calling a Pretor, who not able to indure the intollerable pains and torments of a certain disease, and being weary of his life, at Bilbil in Spaine, shortened his owne daies by taking Opium. By reason whereof, Physitians are growne to great variance, and be of contrary opinions as touching the vse of the foresaid Opium. *Diagoras* and *Erasistratus* condemned it altogether as a most deadly thing, & would not allow that it should be so much as injected or infused into the body by way of clyster, for they held it no better than poison: and otherwise hurtful also to the eies. *Andreas* saith moreouer, That if Opium doth not presently put out a mans eies & make him blind, it is because they of Alexandria in Egypt do sophisticate it. But in proceesse of time the later & modern Physitians did not vtterly reject it, but found a good vse therof, as may appeare by that noble and famous Opiat confection called *Diacodium*. Moreouer, there be certain ordinary trofches made of Popy seed beaten into powder, which with milk are commonly vsed by way of a liniment to bring sicke patients to sleepe. Likewise with oile Rosat, for the head-ach; and with the same oile they vse to drop it into the eares for to mitigate their pain. Also a liniment made therof with breast-milk is singular good for the gout. In which sort there is a great vse of the leaues also to the same purpose. And being applied as a cataplasme with vineger, they help *S. Antonies* fire, and all sorts of wounds. For mine own part I would not haue it in any case to enter into Collyries, much lesse vnto those medicines which be ordained to driue away ague fits, or into maturatiues, no nor to go among other ingredients into those remedies which are deuised to stay the flux that commeth from the stomack. Howbeit, in this case last specified, many giue the black Popy with wine. All garden Poppies grow rounder in the head than the wild: for these beare a head longer & smaller, howbeit (for any vse) of greater operation than those of the garden. For the decoction therof taken as a drink, procureth sleep to such as be ouer watchfull: so doth a fomentation thereof, if either the visage bee sprinkled, or the mouth washed therewith. The best Poppies be they that grow in dry places and where it raineth seldom. When the heads and leaues both be sodden & stamped, the iuice that is pressed from them, Physitians call *Meronium*: and it is far weaker and duller in operation than Opium. Now to know which is good Opium indeed, the first and principal trial is by the nose; for the true Opium is so strong, that a man may not indure to smel it: the second proof is by fire: for the right Opium will burn cleare like a candle, and when it is put forth yeeldeth a stinking sent from it in the end: which signes are neuer to be found in that which is falsified and sophisticate; for this that is not right, will not so soon take a light fire, and besides, is readie oftentimes to go out. There is another experiment by water: for the good and pure Opium being put into water, sendeth forth a certaine mist from it like a cloud, which floteth euen aloft: whereas the corrupt and depraued Opium gathereth into blisters and bladders, and so bubbleth vpon the water. And yet there is oneway more admirable than the rest to try good Opium euen by the Sun-shine in a Summers day: for if it be such as it ought, it will sweat and resolute into a thin liquor, like as when it came first out of the plant. To conclude, *Mnesicles* is of opinion, that the best means to keep and preferue Opium, is to lay it in Henbane seed: but others thinke it better to let it lie among beanes.

CHAP. XIX.

Memisbam. ¶ Of the wandering Popy, and the horned Popy. Of * *Glaucium* or *Paralium*. Of *Heraclium* or *Asphrum*. Of the composition named *Diacodium*, and of the *Tithymal*.

IN a middle nature betwene the garden Popy and the wild, is to be ranged a third kinde: which because it commeth vpon corne fields, but yet vnswon and of the own accord, we haue called *Rheas*, and wandering Popy. Some there be, who so soon as it is gathered, chew both heards and head all whole as it grew, and so eat it. Fiue heads of this Popy being sodden in three hemines of wine, and so taken in drinke, do both purge the belly, and also bring the patient to sleep.

Of these wild Poppies there is one kind called in Greek *Ceratitis*, of a dark or dusky green, growing vpon with a stalk a cubit high; with a grosse root, couered with a thicke rinde; the heads

A heads or cups wherein the seed lieth, bend like vnto a little horne. The leaues are lesse and slenderer of this Popy than of any other wild. The seed also is smal, ripe and ready to be gathered in corn haruest; which being taken in drinke, to the quantity of half an Acetabell in honied wine worketh downwards and scoureth the belly. The leaues being stamped with oyle, and so applied, heale the haw in horse eies. The root taken to the quantity of an Acetabell, and sodden in two sextars of honied wine, vntill halfe be consumed, is giuen in drinke for the infirmities of the loins and liner. The leaues applied as a cataplasme with hony, healeth Carbuncles. Some call this kind, *Glaucium*, others *Paralium*; for it growes within the aire of the sea, or els in some brackish place standing much vpon Nitre.

Another kind of these wild Poppies is called of some *Heraclion*, or of others, *Aphron*, with leaues resembling * Sparrows, if a man look a far off. The root runneth very ebbe and superficially vnder the green sord, and the seed seemeth charged with a certaine froth or foam. Here- with linnen cloths in summer time vse to be bleached, and to get a bright white colour. This herbe beaten in a mortar to the quantity of one Acetabell, and taken in white wine, helpeth the falling sicknesse; for it causeth the patient to vomit. This kinde of Popy is the principall ingredient or Basis to the confection named *Diacodium* or *Arteriacum*. The composition or making whereof ensueth in this maner: Take of this Popy heads, or of any other of the wilde sort, 120: let them lie in ioke or infused two daies together in three sextaries or halfe a gallon of water: and in the same water boyle them wel. When this decoction hath passed through a strainer or jelly bag, seeth it a second time with hony vpon to the height or consistence of a Syrupt (that is to say, vntill halfe be consumed away) ouer a soft and gentle fire. Herunto the modern Physicians which came after, put too, of Saffron, of Hypocisthis, Frankincense, Acacia, of each six drams, and in the end, of grosse cuitt of Candy one sextar. But this later composition serued onely for a shew and vaine ostentation, for the simple and plain making of it in old time with Hony and Popy, and no other addition besides, was as wholesome and profitable as this. But to come again to our wild Poppies: there is a third kind therof named *Tithymalos* (which some call *Mecon*, others *Paralium*) carrying a smooth leafe and a white, with a head of the bignesse of a Bean. The time of gathering these Poppies, is when the grape is in the floure: & then the manner is to dry them in the shade. The seed if it be taken in drinke, the quantitie of halfe an Acetabell in mead or honied wine, purgeth the belly. But what Popy soeuer it be, the head either green and fresh, or dry, if it be applied as a liniment to the eies, represseth the flux of watery humors falling to them, and mitigateth their inflammations. If Opium be giuen in pure wine somewhat allaied, presently after the Scorpion hath stung, it is a counterpoyson. Howbeit, some there be who attribute this vertue onely to the blacke Popy, namely, if either the heads or leaues be bruised and reduced into powder.

CHAP. XX.

¶ Of the wild Purcellane or *Peplium*. Of *Coriander* and *Orach*.

HERE is a wild Purcellane also, which they call *Peplium*: more effectual, though not much, than the garden Purcellane; for there be strong and wonderfull properties reported thereof for sundry vses. First it is holden for certain, that this herb if it be eaten as meat, dulleth the poison of venomous arrows, of Serpents also called * Hemorrhoids and * Presters: and being laid to the hurt place, draw forth the said poison. The iuice also of this herb pressed forth and drunk in wine cuitt, is a remedy for those that be poisoned with Henbane. Now if the herb it selfe is not to be gotten, the seed hath the like effect. Moreouer, it is thought to be singular good for the aquosities gathered within the body, and the diseases caused thereby, as dropies, &c. for the head-ach; for rheumatick vicers also, if it be brused and applied with wine. All other sores likewise it healeth, if it be chewed and laid too with hony. After the same manner prepared, it is good to be applied to childrens heads for to temper the heat of the brain, as also to their nauils when they beare out more than they should. For al vehement distillations of watery humors into the eies, as well of old folke as small infants, it is counted singular; for to be applied to the forehead & temples, together with Barly groats: but if it be laid vnto the very eys, then would the same be tempered with milk and hony. Now if it chanced that the eies be ready to fall out of the head, the leaues stamped with the shales of Beane cods, and applied thereto,

* *Seruthio similibus ex Diosc.* i. like to *Seruthium* wherein *Pliny* is foulely ouerscored to translate it *passere presentibus*: because that *seruthio* significeth the herb *Seruthium*, (a Fullers weed) and the bird called a sparrow: vpon which one absurdity more follow still to maintain the same, as commonly it is scene. For that which followeth of bleaching, agreeeth to the foresaid herbe in some sort.

* So called for that they cause flux of Bloud. * Otherwise named *Dioscides*, because they set on fire, as it were, and are vnquenchable thirst: whereupon they tooke both their names.

is an excellent remedy. A cataplasme made of it, with Barly groats, salt, and vineger, cureth an- G
gry wheales and blisters that break out in the skin. The same being chewed raw, represseth the
cankers in the mouth, and the smelling of the gums: likewise, it assuageth the tooth-ache. The
juice of it being well foddren, cureth the sores of the Amygdals, if the mouth & throat be wa-
shed therewith. And some put to this collution a little powder of the stone Murra. And no mar-
uell, for the very chewing only thereof doth fasten the teeth that be loose in the head. It doth
mitigate the inconuenience of crudity and indigestion, it strengtheneth the voyce, and putteth
by thirst. A cataplasme made therewith, hauing gal-nuts and line-seed among, of equal quanti-
ty, allayeth the pains and cricks in the nape or chine of the neck. Tempered with hony & white
fullers clay, it is singular for the accidents that befall to womens breasts. The seed taken with
honey, is very wholesome for such as be short winded. Eaten in sallds, it strengtheneth the H
stomack. If it be laid as a cataplasme [to the belly and Hypochondrial region] it allaieth the heat
of ardent and burning feauers; yea, & in other cases the very chewing of it cooleth the heat of
the guts and entrails. It staith vomits, eaten in vineger: or taken in drink with cumin, it is good
for the bloody flux and other inward imposthumes and filthy sores. Being first foddren and then
eaten, it is singular for those that strain hard vpon the stoole, and notwithstanding many prouo-
cations and profers, deliuer nothing. And whether it be taken in meat or drinke, it is a soue-
raigne thing for the falling sicknesse. For a shift or immoderat course of womens termes, it is
giuen with great successe, the quantity of one acetable measure in wine cuit. A liniment made
with it and salt, is good for the hot gout & S. *Anthony's* fire. The juice if it be drunken, helpeth
the reins and the bladder. It expelleth wormes and such like vermine out of the belly. A good
mitigatiue, it is of pain, if it be applied as a cataplasme to wounds with oyle and Barly groats. I
It mollifieth the stiffenesse and hardnes of the sinews. *Metrodorus* in his book intituled the * A-
bridgement or Breuiary of those roots that are to be cut vp or gathered; gaue counsell to giue
this herb to women, newly laid vpon child-birth, for the immoderate and excessive purgation
that many times followeth them. It cooleth the heat of lust, and represseth dreames of wanton-
nesse. I know my selfe a grand signior in Spain, father vnto a great personage, and one who had
bin advanced to the dignity of a Pretour, who carried euer about him a root of this Peplium
hanging at his neck by a lace or smal thred, & that for the intollerable pains of the Vvula, wher-
to he was subiect; and neuer would he leaue it off, but when he went into the stoue or bayne:
whereby he found such ease, that he was neuer troubled afterward with the said disease. Moreo- K
uer, I haue read in some writers, That if the head be annointed or well rubbed therewith, a man
shall not for a yeare together find any inconuenience of a rheum distilling from the brain: how-
beit, it is thought that the vse thereof wil make the eyes dim.

Concerning Coriander, there is none found growing wild of it selfe without sowing by the
hand. But certaine it is, that the very best commeth out of Egypt: a speciall and peculiar vertue
it hath against one kind of serpent or venomous worm, which they call Amphisbæna [for that
it seemeth to haue an head at both ends] whether it be inwardly taken in drinke, or outwardly
applied. It healeth also other wounds. It cureth the night-foes or chilblans, the red angry pim-
ples also, if it be but only stamped and layd too. There is not a swelling or apostemation gather-
ing to an head, but a cataplasme made with it, with hony and Raisins, either resolueth them, or L
quickly bringeth to maturation. If it be no more but stamped with vineger, it easeth the pushes
and biles that breed commonly in the ordinary emunctories. Three graines of Coriander seed
some prescribe to be eaten before the accessse or fit of a tertian ague: or more than three to bee
rubbed vpon the forehead. Others there are who thinke, that to the same effect they are to bee
laid vnder the bolster and pillow where the patient lieth, before the Sun riseth, and then shall he
be sure to misse his fit and be warished for that feuer. Indeed, Coriander whiles it is green, is of
great force to coole the heat of agues. A cataplasme thereof made with Honey or Raisins, hea-
leth vlcers also that be corrosiue and eat deep into the flesh. In like manner so prepared, it is ve-
ry good for the priuy members; for burns and scaldings, for carbuncles and for the eares. With
womans milk it helps the eyes that water continually. The seed drunken in water, staith the flux M
of the belly & guts; yea, and in case of those violent euacuations vpward & downward, through
the rage of choleric humors, being taken in drinke with Rue, it setteth and knitteth the body
again. If the seed of it be drunken with faller oile and the juice of a Pomgranat, it chafeth forth
worms out of the entrails. *Xenocrates* telleth a strange thing, if it be true, namely, That if a wo-
man-

A man drinke one onely grain or seed of Coriander, her menstrual flux will stay one day; if twain,
they will hold vp two daies: and proportionably, looke how many seeds she drinketh, so many
daies shall she go cleare and see no token of them. *M. Varro* was of opinion, That if flesh meat
were powdered or corned with Coriander grosse beaten together with vineger, it would keepe
sweet, and it were all the Summer long.

As for Orach, there is a wild kind of it growing of the owne accord: a very weed it is and no
better, vtterly condemned by *Pythagoras*; as if it bred the Dropsie, ingendered the laundise,
brought folk to look ill and pale, and were exceeding hard of digestion: and so far hee was out
of conceit with it, that he thought nothing would like wel & prosper, no not in a garden, where
this grew neere, but that it would sensibly decay and fade. *Dionysius* and *Diocles* approoue this
B judgement of *Pythagoras*, and say moreouer, that most diseases are bred thereby. Nay, they would
not haue it to be put into the pot to be foddren, vnlesse it had bin washed before in many waters.
These Physitians hold that it is a very enemy to the stomach, ingendring pimples, freckles, and
whelks. But I muse and maruell much why *Solon* of Smyrna should write, that it hath much ado
to grow and come vp in Italy. As for *Hippocrates*, he is not so far fallen out with it; for with it
and Beets he maketh a decoction (to be injected by the Mettrenchyre) to assuage the inflamma-
tion in the matrice & the natural parts of women. *Lycus* of Naples was wont to giue it to drink
as a counterpoyson against the green flies *Cantharides*. And he thought that a very good lini-
ment might be made thereof, either raw or foddren, to lay vnto biles, pushes, fellons a breeding,
and all hard tumors whatsoeuer. Semblably, that if S. *Anthony's* fire were annointed therewith,
C being incorporat with hony, vineger, and nitre, or if it were applied vnto the gouty parts, there
would ensue great easement. Moreover, in case the nailes be grown crooked, vneuen, & rugged,
it is said that it wil cause one to cast them without any vicer and sore at all. Some there be who
prescribe an electuary, made with the seed of Orach and hony, to be giuen for the laundise: also
if the windpipes be hoarse with some fell or sharp rheume falling downe vpon them, or, if the
Amygdals on either side of the throat be amisse, it is very good to rub those parts therewith.
They affirme moreouer, That a simple decoction of it alone, moueth the body downward; but
with Mallows or Lentils, prouoketh vpward and causeth vomit. Finally, to conclude with the
wild Orach, it is vsed much to colour the haire black, and for the other aboue named purposes,
as well as that of the gardens.

D

CHAP. XXI.

¶ Of the common Mallow. Of the Mallow Malope. Of the Marsh Mallow or Alisa. Of
the common Docke: the soure Docke or Sorrell: of the water Docke: of the
tall Docke called Patience: and lastly of that Docke with
the long root, called Bulapathum.

O Raches were not so much discommended, but on the contrary side Mallows be as highly
praised, as wel that of the garden as the wild. Two kinds there be of the garden mallows;
distinguished both by the largenesse of their leaues. The greater of those that grow in
gardens, the Greekes call Malopum; the other is supposed to be named Malachum; for that it
doth mollifie and soften the belly. Of the wild sort, that which carrieth a broad leafe and white
E roots is called * Althæa, and of some, Aristalthæa, for the excellent vertues that it hath in Phy-
sick. This property haue Mallows, To enrich and fatten any ground, whersoever they be sown or
set. But this marsh Mallow Althæa, is more effectually than the rest against all wounds by sharp
pricks or thornes, and principally against the sting of Scorpions, Wasps, and such like, as also
the biting of the Hardiflurew mouse. Nay, whosoever be thoroughly rubbed or annointed be-
fore hand with any Mallow whatsoeuer, stamped with oyle; or do but carry it about them, they
shall not be stung or bitten at all. As for the leafe of Mal lowes, if it be laid vpon a Scorpion, it
will be freightwaies benumbed. Moreover, good counterpoisons they be all: a liniment made
of them being raw, together with nitre, draweth forth all pricks or stings remaining within the
F flesh: but if leafe and root be foddren together and so drunk, it represseth the poison of the ve-
nomous fish called the sea-Hare; but some say it must be cast vp and vomited againe, or else it
doth no good. Certes, strange and wonderfull things be spoken as touching the operation of
Mallows, ouer and aboue those already rehearsed. But this passeth all the rest, That if a man or
woman

woman sup off a smal draught (though it were no more but half a cyath) euery day of the juice of any mallow, it skills not which, he shall be free from all diseases and liue in perfect health. True it is, that if they be putrified and resolued in chamber-lie, they will heale all the scurfe & running scalls in the head; but if they be tempered with hony, a collution made thereof cureth the cankers of the mouth; and a lauature represseth all tetter, ring wormes, & any such wild fire running vpon the skin. A decoction of the root, clenseth the head of dandruffe, if it be washed therewith, & fethereth the teeth fast that were loose. Take the root of that mallow which riseth vp with one only stem, prick the gums therewith about the tooth pained; do this (I say) till the ach be gone. The same root reduced into a liniment, with the fasting spittle of man or woman, and applied accordingly, resolues the Kings euil, dispatcheth the swelling kernels behind the ears, and discusseth biles and pushes, without any breaking of the skin or making vicer. The seed of mallows if it be taken in thick wine, deliuereth the patient from phlegmatick humors, from the rheume, and the heauing of the stomack making offer to cast and cannot. The root wrapped fast and tied within a lock of blacke wooll, preventeth the euill accidents that may befall vnto womens breasts. The same sodden in milk & taken after a suppling sort (in manner of a supping) for fūe daies together, cureth the cough. And yet *Sextius Niger* saith, they be hurtfull to the stomack. And *Olympias* of Thebes affirmeth, That if women vie it with goose greafe, they shall not ge their full time with childe. Others do write, That if women take an handfull of Mallow leaues in oyle and wine, they shall be thoroughly purged in their due times. This is known for a truth and resolued by all that write or make profession of Physicke, That a woman in labour, if she sit vpon Mallows strewed vnder her stoole, shall be deliuered with greater speed and expedition; but then must they be taken away presently after that she is laied, for feare that the very matrice follow after the child. An ordinary practice it is of sage and discret midwives, to giue vnto women in trauell fasting, a small pint of the juice of Mallows sodden in wine; & yet those that cannot contain but shed their naturall seed, are inioined to take mallow seed bruised, and so to bind it to their arme. Moreover, so good and fauorable naturally be mallows to the game of loue, as if they grew for nothing els: in so much as *Xenocrates* doth asseme, That if the seed of that Mallow which runneth vp in one stalk, be reduced into pouder and strewed vpon that part of a woman which Nature hath hidden, she will be so wooed after the company of a man, as she will neuer be satisfied nor contented with embracing. The like effect (saith he) there wil ensue, if three roots thereof be bound neere to the place of Nature. Also, that a decoction of Mallows ministred by way of clyster, is a singular injection to cure the bloody fixe, or exulceration of the guts; as also the extraordinary and bootlesse desire to the sege. In like manner, a fomentation thereof is very good for other accidents befalling to the seat or tuil. The juice of Mallows is giuen warm, the quantity of three cyaths, to melancholick persons that be troubled in mind, and of foure, to those that be stark mad indeed and besides themselves. A whole hemina of the juice drawne and pressed from mallows boyled, is giuen at one time to those that be subiect to the falling sicknesse. The same being reduced into a liniment, is to good purpose applied warm vnto those, who are troubled with the stone and grauell, with winde cholique and ventosities, with the cramp also or crick that doth draw their necks backward. The leaues being sodden in oyle, are layd with good successe in manner of a cataplasme, vpon the hot fretting humor called *S. Antonies fire*: also to places scorched, burnt, or scalded: but for the accidents and Symptomes concurrent with wounds, they be rather laid raw with crums of bread. The juice of mallows boiled, is comfortable to the sinews, the bladder, and the fretting or grinding of the guts. Mallows being either eaten, or their decoction ministred by way of injection with a metrenchyte, mollifieth the said tumors in the matrice. The juice of mallows wel sodden, either taken in drinke or applied by way of fomentation, inlargeth the Vretere conduits, and giueth good and easie passage for the vrine. The root of Althæa is more effectual to all these infirmities and purposes aboue named, than of any other Mallow; but especially in case of convulsions, cramps, and ruptures. If it be sodden in water, it bindeth the belly. Boyled in white wine and applied as a cataplasme, it resolue the swelling kernels, commonly called the Kings euil; those also that appeare behind the ears; yea, and the inflammations of the paps and breasts. As for the byles or ringings called Pani, the leaues of Althæa or the Marish Mallow sodden in Wine and brought to the forme of a liniment, doe discusse and rid away. The same, after they bee drie, and sodden in milke, cure the Cough, how tough and shrewd soeuer it were, and that most speedily.

Hippocrates

* A woman
Physitian, who
writ of Phys-
ick, or at least
wife a midwife
of good au-
thoritic.

- A** *Hippocrates* gaue counsell to them that were wounded, & for losse of blood exceeding thirstie, for to drinke the juice of Althæa roots sodden. He saith moreover, That the root it selfe empla-
stred with hony and rosin, is good for wounds, bruises, dislocations, and swellings: comfortable
also to muscles, sinews, or joints. He gaue it likewise to those that were troubled with difficulty
of taking wind, and with wheezing; for the dysentery also or bloody flux, to be drunken in wine.
A wonderful thing of this root, that if it be put into water, and the same let to stand abroad in
the open aire, the water will gather to a thicknesse and cruddle, yea turne white it will like milk.
To conclude, the newer and fresher Althæa is, the more effectually you shall haue it in operation.
Touching the Dock, the properties thereof are not vnlike to those of the marish Mallow: there
is a wild kind thereof, which some call Oxalis in Greek [*i. wild Sorrel* or *Soure dock*] this herb
resembleth very neere that of the garden, in regard of the sharpe pointed leaues; in colour like
the white Beet, hauing a very small root: our countrymen name it in Latine Rumex; other La-
patham Cantherinum: this herb being incorporat with hoggs greafe, is singular to mollifie all
the swelled kernels, which some call the Kings euil. A second sort there is, which commonly is
called Oxylapathum, *i. Sharp pointed Dock*; this cometh yet neerer to the garden Docke
than the former: for it hath leaues sharper at the point and redder, and groweth not but in ma-
rish grounds. There is another kind of Dock comming vp in the very water (as some say) Hy-
drolapathum. Yet is there one more called * Hippolapathum, bigger than the garden Docke
or Sorrell, white also, and of a more fast and pulposus substance. As for all the wild Dockes or
Sorrells, they be holden medicinable to cure the sting of Scorpions; and who soeuer hath any
of them about him, is secure from the sting or prick of Scorpions. The root, if it be sodden in
vineger and strained, the juice thereof if the mouth be washed therewith, helpeth the teethe ach:
and if the same be taken in drinke, it cureth the jaundise. The seed of this hearbe remooueth the
tough humors bedded in the stomack, how hard impacted soeuer they be: the roots of Patience
haue this peculiar property, To cause the nailes to fall off that grow rugged and vneuen. The
seed taken to the weight of two drams in wine, riddeth away the bloody flux. The seed of the
sharp Dock being washed in rain water, is singular good for those that reach and cast vp blood,
if there be added thereto as much Acacia as the bignesse of a Lentill. There be most excellent
Trochisques made of the leaues and root thereof, with the addition of nitre and some little
quantity of * conuenient liquor, to incorporat and vnite them: and these must bee infused and
dissolued in vineger, at the time that they are to be vsed. As touching the garden Sorrell, there
is a liniment made thereof, which being applied in manner of a frontall to the forehead, cureth
the distillation of the watery humors to the eies. The root is singular for the wens or impos-
tumes called Melecerides, and likewise of the Lepry. The decoction in wine is as good for the
stone and grauell, as also to resolue the Kings euil, and the swelling kernels behind the ears. If
the seed be drunk in wine, it helpeth the spleen and the tumors thereof: the bloody flux likewise,
the stomachicall flux, and the vaine desire to the stoole without effect. But for all these purpo-
ses, the juice of the Dock is more effectual.ouer and aboue, it breaketh wind vpward, it prou-
oketh vrine, and discusseth the cloud and Mist that troubleth the eies. If this herbe be put vp vn-
der the bathing tub within the baine, or otherwise if the body be annointed with a liniment
thereof without oyle, before one enter into the bath, it taketh away the itch. If the root be but
chewed only, it fasteneth the teethe that shake in the head. The same root sodden in wine, staith
the flux of the belly, and bindeth it; and yet the leaues make the body soluble. Finally (because
I would willingly omit nothing) *Solon* hath made mention of another Docke, called Bulapa-
thum, nothing different from other Dockes; but that the root runneth deeper to the ground,
which, if it be taken in wine, cureth the bloody flux.

CHAP. XXII.

¶ Of three kinds of Senvey: of Horehound, and wilde running Thyme: of water
Cresses: of water Mints, otherwise called Thymbraim: of
Linsced, and Blects.

- F** The herbe Senvey, whereof there be three kinds (as I haue already obserued in my treatise
of garden plants) *Pythagoras* hath placed in the highest ranke of those simples that fume
vp aloft: for there is not a thing that sooner biteth one by the nose, & pierceth and moun-
teth

* Patience, or
Monks Rheu-
barb.

* True, haply
for Thyme, &
Frankincense,
according to
Cormacian.

teth more quickly into the brains than doth Senvey. The seed thereof [commonly called mustard seed] being stamped, & with vineger reduced into a liniment, cureth the sting of serpents, and namely the prick with the Scorpion. It hath besides, a singular vertue to mortifie & kill the venomous quality of mushrooms. If it be but held in the mouth vntill it melt and resolute, or otherwise be gargarised with honied water, it draweth waterie fleame out of the head. Beeing chewed, it easeth the toothach. For the falling down of the Vvula, a gargarisme made of it with vineger and honey, is excellent. There is not a medicine so singular for the stomach and all the infirmities thereof, ne yet for the lungs. Being eaten at meat, it doth loosen superfluous fleame, and causeth a man to reach and fetch it vp with ease; yea and to take his wind and breath at liberty. In like manner, being taken warm with the juice of Cucumber, it cureth the falling sicknesse. It purifieth the senses: it purgeth the head by smelling: it keepeth the body soluble: it prouoketh womens monethly fleures, and vrine. A cataplasme made therewith and applied accordingly, helpeth them that be in a dropisie: so it doth those that be subiect to the falling sicknesse. but then must it be stamped with three parts of Cumin and figs. If it be tempered with vineger and held to the nose of such women as with the rising of the mother seeme to be strangled and to lie in a trance, it raiseth them vp again; in like sort, it awakens those who be in a fit of the lethargy; howbeit, in this case it is good to put thereto the seed of Sefeli of Candy, which they call Tordilion. But say that the Patients be in so deep a sleep in this drowfie disease, that by such means they will not start vp and be raised; then take mustard-seed and figs, temper them with vineger into a cataplasme, apply the same to the * legs or the * forehead or region of the brain rather. It hath a caustick or burning quality, and being applied in form of a liniment to any part, it raiseth pimples; by which means it cureth the old inueterat pains of the brest, the ach of the loins, the haunch, and hucklebone, the shoulders or any part of the body where need is that the offensive humors settled deep within, should transpire and be drawn outwardly to an issue. Now for that the nature thereof is to blister, in case the patient be timorous, & fear some extreme operation of that burning quality that it hath, it may be applied to the part affected between a doubled linnen cloth: otherwise, if the place be very thick and hard, it would be laid too without any figs at all. Moreouer, there is a good vse of Senuy with red earth, for to make the haire come again which is fallen for scabs and scurfe, for foule morphew or the leprosie, the lowfie disease, the vniuersall cramp that causeth the body to stand stiffe and stark, as it were all of one piece without ioint; also the particular cricke which setteth the neck backward, that it cannot stir. An Anction made with it and hony, cureth the eye-lids that be not smooth, but rugged and chapped; yea and clarifieth the eyes which be ouercast with a muddy mist.

As touching the juice of Senvie, it is after three sorts drawne; the first being pressed forth, it is let to take a heat in the Sun gently by little and little, within an earthen pot. Secondly, there issueth forth of the small stems or branches that it hath, a white milky liquor, which after it is dried and hardened in that manner, is a singular remedy for the tooth-ach. Where note by the way, that the seed & root both, after they haue bin wel steeped and soaked in new wine, are stamped or brayed together: now if one do take in a supping as much of this iuice thus drawne, as may be held in the ball of the hand; it is very good to strengthen the throat and chaws, to fortifie the stomach, to corroborat the eies, to confirm the head, and generally to preserue all the senses in their entire. And verily I know not the like wholsome medicine againe, to shake off and cure the lazy and lither feuers that come by fits many times vpon women. Senuy also being taken in drinke with vineger, breaketh the stone and expelleth it by grauell. There is an oyle also made of mustard-seed, infused and steeped in oyle, and so pressed out; which is much used to heat and comfort the stiffenesse of sinewes occasioned by cold; to warme also and bring into temper the thorough cold lying in the loins, hanches and hucklebones, whereof commeth the Sciatica. Of the same nature and operation that Senue is, Adarca is thought to be (according as I haue touched in the discourses of plants and trees growing wild in the woods;) which is a certain fomy substance arising and sticking in the bark of certain Canes, vnder their very leaues and tufts that they beare in the head.

Concerning Horehound, which the Greekes call Prasion, others Linostraphon, some Phyllopes or Philochares, an hearbe so well knowne and so common, that it needs no description; many Physicians haue commended to be as medicinable as the best. And in truth, the leaues and seed both, being beaten into powder, are excellent good for the stinging of serpents, for the

A paine of the brest and sides, & singular for an old cough. Moreouer, the juice is right soueraign for those who haue their lungs perished and do reach vp blood, if the branches thereof gathered and bound vp into bunches, be sodden first in water with the grain called Panick, for to mitigate in some sort the vnpleasant harshnesse of the said juice. A cataplasme of Horehound applied vnto the Kings euill with some conuenient fat or grease, resolueth the hard kernels. Some prescribe a receipt for the cough in this maner; Take the seed of green Horehound, as much as a man may comprehend with two fingers, seeth it with a smal handful of the wheat called Far, putting thereto a little oile and salt, and so sip off the decoction fasting. Others hold, That without all comparision there is not a medicine in the world like to the juice of Horehound and Fennel together, first drawn by way of expression to the quantity of 3 sextars, & afterwards boiled to the consumption of a third part vntill there remaine but two sextars; then to this decoction there must be put one sextar of hony, & all sodden again to the consumption of one third part more, vnto the height of a fyrtryp; whereof one spoonfull euery day taken in a cyath of water, is a drink that in this case hath no fellow. Horehound stamped and mixed with hony, is of wonderfull effect being applied to the priuy parts of a man, for any griefes incident thereto. Laid with vineger, vnto ring-worms, tetter, and any such running wild fires, it purgeth and riddeth them clean away. A wholsome medicine it is to be applied as a cataplasme, to ruptures, convulsions, spasmes, and cramps of the sinews. Taken in drinke with salt and vineger, it easeth the belly and maketh it laxatiue. It prouoketh womens terms, and sendeth out the after-birth. The powder of it drie, mixed with honey, is of exceeding great efficacy to ripen a dry cough, to cure gangrenes, white-flaws, and wertwells about the root of the nails. The juice dropped into the ears with honey, or snuffed vp into the nose, cureth their infirmities; it scoureth away the laundise also and purgeth cholerick humors. And for all kinds of poisons, few herbs are so effectuell as Horehound; for it selfe alone without any addition, clenseth the stomach and brest, by reaching and fetching vp the filthy and rotten fleam there ingendred. If it be taken with hony and the floure-de-lis root, it prouoketh vrine. Howbeit, where there is danger of any exulceration in kidneys or bladder, it must be vsed with great warinesse, if it be vsed at all. Moreouer, the juice of Horehound is said to clarifie the eie-sight. *Cassor* putteth downe two sorts of Horehound, to wit, the black and the white, but he setteth greater store by the white than the other. He prescribeth to take an empty egg-shel, and to put into it the juice of Horehound and hony, by euen portions; & when the said egge is warm, to minister the same by way of clyster or syringe, promising vs that the said injection will breake all inward imposthumes; and when they be broken, cleanse and heale them thoroughly. Also a liniment (saith hee) made of Horehound stamped together with old swines grease, cureth all wounds occasioned by the biting of mad dogs.

Touching running Thyme, some thinke it is called Serpyllum in Latine, a *serpendo* [i. of creeping] because it runneth and creepeth by the ground; a property indeed of the wild kind, and especially among rocks and stony grounds. The garden Serpyllum, which commeth of seed, creepeth not, but groweth to the height of four-fingers bredth. The wilde Thyme which commeth vp of the own accord, liketh and thriue better, hauing whiter leaues and branches than the other: this (I say) is thought to haue a speciall vertue against serpents, and namely the Cenchris, the Scolopendres also as well of the sea as the land; likewise the Scorpions, in case the sprigs and leaues thereof be sodden in wine, and so taken inwardly: if the same be burned, it yeeldeth a perfume, which with the very sent chafeth them all away. A singular power it hath against all venomous creatures of the sea. Boiled in vineger, & reduced into a liniment with oile of roses, it cureth the head-ach, if it be applied as a frontall to the forehead and temples. In like manner it helpeth the phrensie and lethargy; but if it be given to drinke, the weight only of four drams, it easeth the wrings & torments of the belly, it giueth free passage with ease to the vrine, it resolueth squinancy or bringeth them to maturity, and stiaeth vomits. And if one drinke it with water, it is excellent good for the opilation, heat, inflammations, and other accidents of the liuer. The leaues, to the weight of four oboli, are giuen in vineger, for the inflation and hardnesse of the spleen. If it be bearen to powder and giuen in 2 cyaths of vineger and hony, it is thought a good medicine for them that spit and reach vp blood.

The wild Sisybrium or Cresses, called of some Thymbraem, groweth to a foot in height and no higher. That which commeth vp in watery places, is like vnto garden Cresses: but both sorts are effectuell against all pricks and stings of Hornets, and such like creatures. That which

springeth vp in dry ground, hath the narrower leafe of the twain, and carrieth a sweet smel with it; whereupon it is commonly plaited amongst other odoriferous herbes in chaplets and guirlands. But both the one and the other allaieth head-ach: likewise they doe stay the flux of waterish humors which distill into the eyes. Some put crums of bread thereto; others seeth them alone in wine, and vse the decoction. Being reduced into a cataplasme, and so applied euery night and taken off in the day time, it heals within foure times laying on, the angry chilblanes and bloody-fals that trouble the feet in the night season; yea and taketh away the spots & pimples arising in womens faces, which marreth their beauty, whether it be eaten with meat in sub-
 stance, or the juice only taken in drink; it staieth vomits, yexes, wringings, gnawings, and the dissolution or feebleness of the stomach, which causeth inordinat flux. Women going with child must take heed how they eat Sisybrium, vnlesse the fruit of their bodies be dead within them; for if it be but applied outwardly, it will send it forth. If one drinke it with wine, he shall find that it prouoketh vrine; and the wild kind ouer and besides, expelleth the stone and the grauell. Such as had need to wake and watch, namely, those that be giuen to drowsinesse and lethargie, will be raised from their sleep and throughly wakened, if it be distilled aloft vpon their heads with vineger.

Line-feed is employed with other matters in diuers medicines to many vses, but of it selfe alone it cleareth the skin of womens faces, taketh out spots, freckles, pimples, wems, and molls that be eye-sores, if it be applied as a liniment thereto. The juice therof quickneth and helpeth the eye-sight. With Frankincense and water, or els with Myrrhe and wine, it represseth the violent flux of humors to the eyes. Reduced into a cataplasme, with honey, greafe, or waxe, and so applied, it resolueth the swelling kernels behind the ears. The meale thereof in manner of drie barley groats, if it be strewed vpon the stomach, helpeth the weaknesse and queasinesse thereof, which maketh it ready to ouerturn. If it be foddren in water and oile, and so reduced into a liniment with Annise-feed, and applied, it cureth the squinancie. It must be wel dried and parched at the fire, in case it be giuen to stay the running out of the belly. As for those that be troubled with the stomackall flux, or the exulceration of the guts; a cataplasme thereof with vineger and so applied, bringeth them present ease. For the griefe of the liuer, it ought to be eaten with raisons. This seed is passing good for lioches or eleotaries to be made thereof, in the cure of the Phthisick, and consumption of the lungs. Linefeed growing into floure and mingled with nitre or salt, or els with ashes put thereto, is of great operation to mollifie the hardnesse of muscles, sinews, joints, and the nape or chine of the neck; yea and to mitigat the inflammations of the membrans or pellicles of the brain. The same applied with figs, is an excellent maturatiue, and ripeneth all impostumes. But if it be laid too with the root of the wild Cucumber, it draweth forth any thing that sticketh within the body, euen the very spils & shiuers of broken bones. The said powder or floure made of Line-feed foddren in wine, and applied as a cataplasme, stayeth cancerous vlcers that they run no further: the same also with hony ripeneth apostemations of flegmatick humors, and the breaking forth of the small pox. Being mingled with an equall portion of garden Cresses, it cureth the rough nailes that grow vntowardly, and fetcheth them off without any inconuenience. Incorporat with rosin and * Myrrhe, and so laid to the cods, it helpeth their swelling and inflammations: it is good also for ruptures of all sorts; & with water it healeth the gangrene. Take of Line-feed & Fenigreek seed, of each one sextar, seeth them in bonied water, and make a liniment thereof, it easeth the paine of the stomach. Line-feed ministred in a clystire with oile and hony, cureth the deadly maladies of the guts and breast parts.

Bleets seeme to be dull, vnfauourie, and foolish Woorts, hauing no tast nor quicknesse at all: whereupon Menander the comical Poet, bringeth in a husband vpon the stage, who to reproch his wife for her sottishnesse and want of sense, giueth her the terme of Bleet. And in very truth, good it is for little or nothing, and altogether hurtfull vnto the stomacke. It troubleth and disquieteth the belly, inasmuch as it driueth some that vse to eat it, into the dangerous disease Cholera, working both vpward and downward without any stay. And yet some say, that if it be drunk in wine, it is good against Scorpions, and serueth for a prery liniment to be applied vnto the agnells or corners of the feet; yea and maketh a reasonable good cataplasme with oile, for the spleen, and pain of the temples. Finally, Hippocrates is of opinion, that much feeding of Bleets, staieth the monethly course of womens tearmes.

CHAP.

CHAP. XXIII.

¶ Of *Meu*, and *Fenell*, as well *Gentle*, named *Feniculum*, as *Wild*, which is called *Hippomarathrum*, or *Myrsineum*: of *Hempe*, and *Fenell*-geant: and of *Thistles* and *Artichoux*.

MEu or Spicknell is not found in Italy, vnlesse it be in some Physitians garden, and those are very few that sow or set it. Howbeit, there be two kinds thereof; the one, which is the better, is commonly called Athamanticum, of Prince *Athamas* the first inuenter of this herbe, as some thinke; but according to other, because the best Meu is found vpon *Athamas*, a mountaine in *Theffaly*. Leafed it is like to * *Annise*, rising vp with a stem otherwhile two cubits high, putting forth many roots, and those blackish, whereof some run very deepe into the ground; neither is this Meu so red altogether as the other. If the root therof be beaten into powder, or otherwise foddren and so drunk in water, it causeth vrine to passe abundantly: in that order also it doth resolue wonderfully the ventosities gathered in the stomach. It assuageth mightily the wrings and torments of the guts; it openeth the obstructions, and cureth other infirmities of the bladder and the matrice. Applied with honey, it is very good for the joints. Beeing laid as a cataplasme with Parsley to the bottome of the belly of little children, it causeth them to make water.

As for *Fenell*, the Serpents haue woon it much credit, and brought it into name, in this regard, That by tasting thereof (as I haue already noted) they cast their old skin, and by the juice that it yeeldeth do cleare their eies: whereby we also are come to know, that this herbe hath a singular * property to mundifie our sight, and take away the filme or web that ouercasteth and dimmieth our eyes. Now the only time to gather and draw the said juice out of *Fennel*, is when the stalke beginneth to swell and wax big: which after it is receiued, they vse to dry in the Sun, and as need requireth, make an iniunction with it and honey together. There is of this juice to be had in all places: howbeit, the best is made in *Iberia*, partly of the gum that issueth or frieth (rather) out of the stalk [being brought neere to the fire;] or els drawn from the seed whiles it is fresh and green. There is another making thereof out of the roots, by way of incision, presently after that *Fennel* beginneth to spring and put forth out of the ground, when Winter is done.

D There is another kind of wild *Fenell*, named by some *Hippomarathrum*, by others *Myrsineum*. Larger leaves this hath than that other of the Garden, and those more sharpe and biting at the tongues end: it groweth taller also, and ariseth with a maine stem as big as a mans arm, & hath a white root. It groweth in hot grounds and those that be stony. *Diocles* maketh mention of another kind yet of wild *Fennel*, with a long & narrow leafe, bearing seed resembling *Coriander*. As touching the garden *Fennel*, and the medicinable vertues that it hath, it is holden, That the seed, if it be taken inwardly in wine, is a foueragne drinke for the prick of Scorpions or sting of other Serpents. The juice thereof, if it be instilled by drops into the eares, killeth the wormes therin. The herb it selfe carrieth such sway in the kitchen, that lightly there is no meat seasoned nor any vineger sauce serued vp without it. Moreouer, for to giue a commendable and pleasant tast vnto bread, it is ordinarily put vnder the bottome crust of our loues, when they be set into the oven. The seed doth bind and corroborat a weake and feeble stomach, yea if it be taken in a very ague. Being beaten into powder & drunk in cold water, it staieth the inordinat heauing of the stomach, and the vain proffers to vomit; for the lights and the liuer, it is the most soveraign medicine of all other. Being taken moderately, it staieth the loosenesse of the belly, and yet prouoketh vrine. The decoction thereof appeaseth the wrings of the guts and taken in drink, it sil-
 leth womens breasts, and maketh them to strowt again with milk, when it is gone vpon some occasion. The root taken in a Prifane of husked barley, purgeth the reins; so doth the syrrop made with the juice or decoction therof, yea and the seed. The root foddren in wine, is singular good for the dropie and the cramp. A liniment made with the leaues and vineger, and so applied, assuageth hot swellings and inflammations: and the said leaues haue vertue to expel the stone of the bladder. *Fennel* taken inwardly any way, increaseth sperme or natural seed. A most friendly and comfortable herb it is to the * priuie parts, whether it be by fomenting them with a decoction of the roots boyled in wine, or by applying a liniment to them made with the said roots stamped & incorporate with oile. Many do make a cerote thereof with wax, for to lay vnto tumors;

ing roots.

mours to places bruised & made black and blew with stripes. Also they vse the root either pre-
pared with the juice of the herb, or otherwise incorporat with hony, against the biting of dogs,
and taken in wine, against the worm called Milleped. But for all these purposes before said, the
wild Fennell is of greater operation than the garden Fennell: but this principal vertue it hath,
mightily to expell the stone and grauell. If it be taken with any mild and small wine, it is ve-
ry good for the bladder [and namely the Strangury] also it prouoketh womens tearmes that be
either suppressed or come not kindly away: to which purpose the seed is more effectuell than
the root. But whether it be root or seed, it would be vsed in a mean & measure: for it is thought
sufficient to put into drink at once, as much as two fingers will take vp. *Petradius*, who wrote the
booke intituled *Ophiaca, and *Mytion* likewise in his Treatise named *Rhizotomumena were
of opinion, That there is not a better counterpoyson against the venome of Serpents, than, wild
Fennell. And certes, *Nicander* himselfe hath raunged it, not in the lowest place of such medi-
cines.

Concerning Hemp, at first it came vp without sowing euen in the very woods, and carried a
more dusky green leafe, and the same rougher. It is said, that if men eat the seed, it wil extin-
guish vterly their own seed. The juice of green Hemp-seed, being dropped into the eares, dri-
ueth out any wormes or vermin there ingendred, yea, and what ear-wigs or such like creatures
that are gotten into them: but it will cause head-ach withall. So forcible is this plant, that (by
report) if it be put into water, it will make it to gather and coagulat. Which is the reason, that
if horses haue the gurry, they shall find help by drinking the said water. The root if it be boiled
in water, doth mollifie and soften ioints that be shrunk vp: it assuageth the pains likewise of the
Gout, and such like wicked humors that fall down vpon any part. Being yet green and reduced
into a liniment and so applied, it is good for burnes or scaldings, but it must be often remoued
and changed before it bedrie.

As for Ferula or Fennel-geant, it carrieth a seed like to Dill. That kind which riseth vp in
one stem, and then diuideth it self and brancheth forth in the head, is supposed to be the female.
The stalks are good to be eaten boyled: and the right sauce wherein they be serued vp, to giue
them a more commendable taist, is new wine and hony tempered accordingly, and so prepared,
they be good for the stomack. Howbeit, if one eat ouer-liberally of them, they cause head-ach.
Take the weight of one denier Roman of the root, beat it to powder and drinke it in two cyaths
of wine, you shall find it a soueraine medicine against the stinging of serpents: but you must
not forget meanwhile to apply the root it self (stamped into a cataplasme) vnto the hurt place.
After this manner it helpeth the wringing torments of the guts. Make a liniment or vnguent
thereof and vineger together, annoint the body therewith; it restraineth the immoderate sweats
that burst out, although the Patient be sick of a feuer. The juice of Ferula, if it be eaten (to the
quantity of a Beane) doth loosen the belly. The small tendrils or branches of greene Ferula, is
good for all the infirmities abouenamed. Take ten grains of Ferula seed in powder with wine,
or so much of the pith within the stalk, it stancheth bloud. Some hold it good to giue a spoon-
ful thereof euery fourth, sixth, and seventh day after the change of the Moon, to preuent the fits
of the falling sicknes. The nature of all these Fennel-geants is most aduerse to Lamprcies, for if
they be touched neuer so little therewith, they will die vpon it. *Cassor* was of opinion, That the
juice is excellent good to cleare the eye-sight.

And forasmuch as I haue spoken somewhat of Thistles and Artichoux (how they should be
ordered) in my treatise of other garden plants, I will put off no longer to discourse also of their
properties and vertues in Physick. Of the wild Thistles there be two kinds: the one more ful of
branches, shooting out immediatly from the root; the other riseth vp in one intire stem, and the
same is thicker withall. Both of them haue but few leaues, and those beset with prickles: they
beare heads pointed with sharp pricks round about in manner of caltrops. Howbeit, there is one
kind, which is the Artichoke, which putteth forth a purple floure amidst those sharpe pointed
prickles, which very quickly turns into an hoarie downe, readie to flie away with euery puffe of
wind: and this thistle the Grecks cal Scolymos. The juice of the Artichoke stamped & pressed
out before it bloome, bringeth haire again thicke, if the naked place be annointed therewith.
The root either of Thistle or Artichoke, foddren in water and so eaten, is as good as a shoog-
horne to draw on pot after pot, for these great bibbers that desire nothing more than to be thir-
sty and to make quarrell to the cup. It strengtheneth the stomacke, and (if we may beleue it) is
so

A so appropriate vnto the matrice of women, that it disposeth and prepareth it to conceiue men
children. In good faith, *Chereus* the Athenian, and *Glaucias* especially, who seemeth to be most
curious in describing the nature and properties of these Thistles or Artichokes, giue out no
lesse. To conclude, if one chew them in his mouth, hee shall finde that they will cause a sweet
breath.

CHAP. XXIV.

¶ The composition of a Treacle which was the ordinarie and familiar
medicine of King Antiochus.

B Vt before that we go out of the garden, and leaue the herbes there growing, I think it good
to set down one confectiō made of them, thought to be a most excellent and soueraine
antidote or preruatiue against the poison of all venomous beasts whatsoeuer, and which
for the excellency thereof was ingrauen in stone vpon the forefront of the temple dedicated to
Esculapius, in this maner following: Take of wild running Thyme the weight of two deniers;
of Opopanax and *Meu of each the like quantitie; the seed of Dil, Fennel, Ameos, and Parsly,
of each the weight of six deniers; of Ervil floure twelue deniers or drams. Let these be beaten
into powder and finely searced; and when they be incorporat in the best wine that may be had,
they ought to be reduced into the form of Trofches, euery one weighing a victoriat or half den-
ier. When occasion is to vse this composition, dissolue one of these Trofches in three cyaths
of wine, and drinke it. This is that famous Treacle or countrepoyson which great *Antiochus*
the King was wont (by report) to take against all venoms or poysons whatsoeuer.

ly. 22 Galen.

THE TWENTY FIRST BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS

SECVNDVS.

The nature of Floures, and namely those of Chap-
lets and Guirlands.

CHAP. I.

¶ The wonderfull varietie of Floures.

As in his Treatise of Gardens ordained as a necessary point, That they should
be planted and enriched with such herbes as might bring forth floures for Co-
ronets and Garlands. And in very truth, their diuersitie is such, that vnpossible
it is to decipher and expresse them accordingly. Whereby wee may see, that
more easie it was for dame Nature to depaint & adorn the earth with sundrie
pictures, to beautifie the fields (I say) with all maner of colours, by her handy-
worke (especially where she hath met with a ground to her minde, and when she is in a merrie
humour and disposed to play and disport her selfe) than for any man in the world to vter the
same by word of mouth. Wherin certes her admirable prouidence she hath shewed principally
in

in this, That whereas she hath giuen vnto those fruits of the earth which serue for necessities & the sustentation of man, long life and a kind of perpetuities, euen to last yeares and hundreds of yerres, these floures of pleasure and delight, good only to content the eye, or please the sense of smelling, she would haue to liue and die in one day. A great document and lesson for vs men in generall to learne, How all things whatsoeuer that flourish most louely and be gayest in shew, soonest fade and are gon suddenly. But to come again to the varietie of floures aforesaid, together with their diuers mixtures: verily there is no painter with all his skill, able sufficiently with his pensil to represent one liuely garland of floures indeed; whether they be plaited and intermeddled in manner of neseagaies one with another, or set in ranks and reues one by another, whether they be knit and twisted cord-wise and in chain-work of one sort of floures, either to wind and wreath about a chaplet, bias, or in fashion of a circle, or whether they be sorted round into a globe or ball, running one through another, to exhibit one goodly sight and entire vniformity of a crosse garland.

CHAP. II.

¶ Of Garlands, Coronets, Chaplets, and Neseagaies made of floures. Who deuised first the sorting and setting of sundry floures. The first inuention of the Coronet or Guirland, and the name of it in Latine, Corolla: and whereupon it was so called.

THE Coronets or Garlands vsed in ancient time were twisted very small, and thereupon they were called Strophia, i. Wreaths: from whence came also womens gorgets & stomachers to be named Strophiola. As for the word Corona, a Coronet or Garland, long it was first ere it came to be vulgar and commonly taken vp, as a term chalenged either by priests and sacrificers in their diuine seruice, or victorious captaines in their glorious triumphs. But those Garlands and neseagaies being made of floures were called in Latine Serta, or Seruiz, i. serendo, i. of sorting and setting together. The manner of which plaiting and broiding of herbes and floures, the ancient Greekes took no pleasure in: for at the beginning they vsed to crowne with branches only of trees, those braue men who had woon the prise in their sacred games and solemne Tournies or exercises of actiuitie. But afterwards they began to beautifie and enrich their chaplets of triumph with sundry floures entermingled together. And, to say a truth, the Sicyonians passed in this feat of sorting together one with another, floures of sweet fauor and pleasant color, in making of posies and garlands. Howbeit the example of *Paufias* the cunning painter, and *Glycera* the artificial maker of such Chaplets, set them first a worke. This Painter was wonderfully enamoured vpon the said *Glycera*, and courted her by all the meanes hee could deuise: among the rest, he would seem to counterfeit and represent liuely with his pensil in colours, what floures soeuer she wrought and set with her fingers into garlands; and these againe strived aue to change and alter her handiwork every day, for to driue him to a non-plus at the length, or at leastwise to put him to his shifts: insomuch, as it was a very pleasant and worthie sight, to behold of one side the works of Nature in the womans hand, and on the other side the artificial cunning of the foresaid painter. And verily there are at this day to be seene diuers painted tables of his workmanship: and namely one picture about the rest, entituled, * *Stephanoplocos*, wherein hee painted his sweet-heart *Glycera* twisting and braiding Coronets and Chaplets, as her manner was. And this fell out to be after the hundreth Olympias was come and gon, by iust account.

Now when these Garlands of floures were taken vp and receiued commonly in all places for a certain time, there came soon after into request those Chaplets which are named Egyptian; and after them winter Coronets, to wit, when the earth affoordeth no floures to make them; and those consisted of horn shauings died into sundry colours. And so in proceffe of time, by little and little crept into Rome also the name of Corolla, as one would say, petty Garlands; for that these Winter Chaplets at first were so pretty and small: and not long after them, the costly Coronets and attires Corollaria, namely, when they are made of thinne leaues and plates and Latin, either guilded or siluered ouer, or else set out with golden and siluered spangles, and so presented.

CHAP.

CHAP. III.

¶ Who was the first that exhibited in publicke shew a Guirland or Chaplet of gold and siluer. fol. c. How highly Coronets were esteemed in old time. Of the honour done to Scipio, of plaited Coronets. And one notable Act of *Queene Cleopatra*.

CASSIUS the rich was the first man, who at the solemn Games and Plaies which he set out in Rome, gaue away in a braue shew, Chaplets of gold and siluer, resembling liuely floures and leaues of hearbes. Afterwards, such Coronets were adorned with ribband also, and those were added as pendants thereto for more honour and state: a deuise respectiue to those * *Tuscane* Guirlands and Coronets, which might haue no such ribbands or lace hanging vnto them but of gold. And in truth those labels a long time were plaine and without any other setting forth saue only the bare gold: vntill *P. Claudius Pulcher* came in place, who exhibited in his publicke shewes, the said labels wrought, chased, and engrauen; yea, and hee garnished the said plates of gold with glittering and twinkling spangles besides. Howbeit, were these Coronets neuer so rich and precious, yet those Chaplets woon and gotten at the solemn Games for some worthy feats of actiuitie performed, caried alwaies the greater credit & authority. For to gaine this prise, the Grand-seigniors and great men of the citie thought it no scorne to enter themselves in proper person into the publick place of Exercise to trie maistries: yea, and thither they sent euery man his seruant and slaue. Hereupon grew these Ordinances, specified among the laws of the twelue tables in these words: *Whosoever winneth Guirland, either himselfe in person, or by his monie, goods and chattels, is to be honoured in regard of his vertue*. And certes who maketh doubt, but what Prize or coroner, either slaues or horses haue obtained, the same by vertue of this law, should be reputed as gotten by the money and goods of the master or owner of the said horses or slaues? But what honor might this be which is thus atchieued by such a chaplet? many that which is right great, namely, that without all fraud and contradiction, not only the party himselfe who woon it, should be crowned therewith after his death, both whiles his body lay vnder board within house, and also all the way that it was caried forth to the place of sepulture or funerall fire; but euen his parents likewise, both father and mother [if they were then liuing], *Jecertes*, such Guirlands otherwise though they were not woon at games or prize, but only made for pleasure & pastime, might not come abroad ordinarily, nor be commonly worn; for the law was very strict and seuer in this case: we read that *L. Fulvius Argentarius* in the time of the second Punicke war, vpon an information or speech giuen out, That in the open day time he only looked forth of a gallerie which he had in the publicke Forum or common place at Rome, with a Garland of Roses vpon his head, was by authoritie of the Senate committed to prison, and was not enlarged before the end of the warre. *P. Munatius* hauing taken from the head of *Marsyas* a Chaplet of floures, and set it vpon his owne; and thereupon being commaunded to ward, by the Triumvirs, called vnto the Tribunes of the Commons for their lawful fauour and protection: but they opposed not themselves against this proceeding, but deemed him worthie of this chastisement. See the discipline and seueritie at Rome, and compare it with the loosenes of the Athenians, where yong youths ordinarily followed reuils and bankers, and yet in the forenoon would seeme to frequent the schooles of Philosophers, to learne good instructions of vertuous life. With vs verily we haue no example of disorder in this behalf, namely, for the abuse of garlands; but only the daughter of *Augustus Caesar* late Emperor, and canonised as a god at Rome, who complaineth of her in some letters of his yet extant, & that with grone and griefe of heart, to be giuen to such riot and licentious loosenesse, that night by night she would seem to adorn with Guirlands the statue and image of *Marsyas* the Minstrell. We do not read in Chronicles, that the people honoured in old time any other with a Coronet of floures, but onely *Scipio* surnamed *Serapio*, for the neere resemblance that he had to his baily or seruant so called, who dealt vnder him in buying and selling of Swine: in which regard he was wonderous well beloued of the commons in his Tribuneship, as bearing himself worthy of the famous and noble house of the *Scipios* surnamed *Africani*. Howbeit, as well descended and beloued as he was, yet when hee died, he left not behind him in goods sufficient to defray the charges of his funerals: the people therfore made a collection, and contributed by the poll euery man one * *As*: and so took order

* These Guirlands or Chaplets were called *Tetrusca*. For so saith *Terullian*. *Proseruatur etiam illis Tetrusca*. *Hoc vocabulum est Cornu* & i. to be Adile

* *three farthings*.

by

* A Garland-maker.

by a generall expence, that he should be honourably enterred: and as his corpes was carried in the streets to his funeral fire, they flung floures vpon his bere out of euery window all the way. In those daies the maner was to honor the gods with chaplets of floures, and namely those that were counted patrones and protectours, as well of cities and countries, as of priuat families; to adorne and beautifie therewith the tombs and sepulchres of those that were departed, as also to pacifie their ghosts, and other infernall spirits: farther than thus, there was no vse of such Guirlands allowed. Now of all those Chaplets, most account was made of them wherein the floures were platted. We find moreover, That the Sacrificers or Priests of Mars called *Sally*, were wont in their solemnities & feasts (which were very sumptuous) to weare Coronets of sundry floures sowed together. But afterwards, Chaplets of Roses were only in credit and reputation: vntill that in proceffe of time, the world grew to such superfluitie and sumptuous expence, that no Guirlands would please men, but of the meer precious and aromaticall leaf Malabathrum: and not content therewith, soone after there must be Chaplets set as far as from India, yea, and beyond the Indians, & those wrought with needlework: and the richest coronet was that thought to be, which consisted of the leaues of Nard: or els made of fine silke out of the Seres country, and those of sundry colors, perfumed besides & al wet with costly and odoriferous ointments. Further than thus they could not proceed, and so our dainty wanton dames rest contented hitherto, and vse no other Chaplets at this day. As for the Greekes verily, they haue written also feuerall Treatises concerning floures and Garlands: and namely, *Mnestheus* and *Callimachus*, two renowned Physicians, haue compiled bookes of those Chaplets that be hurtfull to the braine and cause head-ach. For euen herin also lieth some part of the preseruatiou of our health, considering that perfumes do refresh our spirits, especially when we are set at table to drinke liberally and to make merrie, whiles the subtil odour of flours pierceth to the braine secretly ere we be aware. Where, by the way, I cannot chuse but remember the deuise of Queene *Cleopatra*, full of fine wit, and as wicked and mischieuous withall: For at what time as *Antonie* prepared the expedition and journey of Actium against *Augustus*, and stood in some doubt of jealousy of the said Queen; for al the fair shew that she made of gratifying him and doing him all pleasure, he was at his taster, & would neither eat nor drink at her table without assay made. *Cleopatra* seeing how timorous he was, and minding yet to make good sport and game at his needlesse feare and foolish curiositie, caused a Chaplet to be made for *M. Antonius*, hauing before dipped all the tips and edges of the floures that went to it in a strong and rank poison, and being thus prepared, set it vpon the head of the said *Antonie*. Now, when they had sitten at meat a good while, and drunk themselves merrie, the Queen began to make a motion and challenge to *Antonie*, for to drink each of them their chaplets; and withall began vnto him in a cup of wine seasoned and spiced (as it were) with those floures which she ware her owne self. Oh the shrewd & vnhappy wit of a woman when she is so disposed! who would euer haue misdoubted any danger of hidden mischief herein? Well, *M. Antonie* yeelded to pledge her: off goeth his owne Guirland, and with the floures minced small, dresseth his own cup. Now when he was about to set it to his head, *Cleopatra* presently put her hand betweene, and staied him from drinking, and withall vttered these words, My deare heart and best beloued *Antonie*, now see what she is whome so much thou dost dread and stand in feare of, that for thy security there must wait at thy cup and trencher extraordinarie tasters; a straunge and new fashion ywis, and a curiosity more nice than needfull: lo, how I am not to seek of means and opportunities to compass thy death, if I could find in my heart to liue without thee. Which said, she called for a prisoner immediately out of the goale, whom she caused to drink off the wine which *Antonie* had prepared for himselfe. No sooner was the goblet from his lips againe, but the poor wretch died presently in the place: but to come againe to the Physicians who haue written of floures besides those abouenamed. *Theophrastus* among the Greekes hath taken this argument in hand. As for our countrey men, some haue entituled their bookes * Anthologicon: but none of them all, so farre as euer I could find, wrote any Treatise concerning floures. Neither is it any part of my meaning at this present to make Nosegaies, or plat any Chaplets, for that were a friuolous and vaine peece of work: but as touching floures themselves, I purpose to discourse so much as I think and find to be memorable and worth the penning. But before I enter into this Treatise, I am to aduertise the Reader, that we Romanes are acquainted with very few garden floures for Guirlands, and know in manner none but Violets and roses.

CHAP. IV.

¶ Of the Rose employed in Coronets. The diuers kinds thereof: and where it is set and groweth.

The plant whereupon the Rose doth grow is more like a thorn or bush, than a shrub or any thing else. For it will come of a very Brier or Eglantine also, where it wil cast a sweet and pleasant smell, although it reach not far off. All Roses at their first knitting seeme to be inclosed within a certain cod or huske full of graines: which soon after beginneth to swell and grow sharp pointed into certain green indented or cut buds: then by little and little as they wax red, they open and spread themselves abroad, containing in the midst of their cup as it were certain small tufts or yellow threds standing out in the top. * Vsed they are exceeding much in Chaplets and Guirlands. As touching the oile Rosat, made by way of infusion, it was in request before the destruction of Troy, as may appeare by the poet *Homer*. Moreover, Roses enter into the composition of sweet ointments and perfumes.ouer and besides, the Rose of it selfe alone as it is, hath medicinable vertues, and serueth to many purposes in physick. It goeth into emplastres and collyries or eye-salues, by reason of a certain subtil mordacitie and penetratiue qualitie that it hath. Furthermore, many delicate and dainty dishes are deuised vpon the table, either couered and bestrewed with Rose leaues, or bedewed and smeared all ouer with their iuice; which doth no harme to those viands, but giue a commendable tast thereto. We at Rome make most account of two kinds of Roses about the rest, to wit, those of Præneste, and of Capua. And yet some haue ranged with these principal Roses, those of Miletum, which are of a most liuely and deep red colour, and haue but twelue leaues in a floure at the most. The next to them are the Trachinian Roses, not so red all out. Then those of Alabanda, which be of a baser reckoning, with a weak colour inclining to white. Howbeit the meaneest and worst of all, is the Rose * Spineola. Most leaues in number it hath of all others, and those in quantity smaller. For this would be knowne, that Roses differ one from another either in number of leaues, more or lesse; or els that some be smooth, others rough and prickly: also in colour and smell. The fewest leaues that a Rose hath be five: and so vward they grow euer still more and more, vntill they come to those that haue an hundred, namely about Campain in Italy, and neere to Philippos a city in Greece, whereupon the Rose is called in Latine Centifolia. Howbeit, the territorie of Philippi hath no such soile as to bring forth these hundred-leaf Roses: for it is the mountain Pangæus neare adioynning, vpon which they naturally doe grow, with a number of leaues I say, but the same small: which being remoued & transplanted by the neighbor borderers, do mightily thrue in another ground, namely about Philippi aforesaid, & proue much fairer than those of Pangæus. Yet are not such Roses of the sweetest kind, that are so double and double againe; no more than those which are furnished with the largest and greatest leaues. But in one word, if you would know a sweet smelling rose indeed, chuse that which hath the cup or knob vnder the floure, rough & prickly. *Capio*, who liued in the time of *Tiberius* the Emperour, was of opinion, That the hundred-leaf Rose had no grace at all in a garland, either for smell or beauty; & therefore should not be put into chaplets, unless it were last in maner of a tuft, to make a fur-croist, or about the edges as a border: no more than the Rose Campion, which our men call the Greek Rose, and the Greekes name Lychnis, which lightly groweth not but in moist grounds, and neuer hath more than five leaues. The floure exceeds not the bignes of a certain violet, and carrieth no sent or fauor at all. Yet is there another Rose called *Gracula*, the floures & leaues whereof are folded and lapped one within another, neither wil they open of themselves, unless they be forced with ones fingers, but looke alwaies as if they were in the bud, notwithstanding that the leaues when they be out are of all others largest. Moreover, there be Roses growing from a bush that hath a stalk like a Mallow, and beareth leaues resembling those of the oliue: and this kind is named in Greek Mofcheuton. Of a middle sife between these abouenamed, is the Rose of Autumne, commonly called Coroneola. And to say a truth, all the said Roses, except this Coroneola, and that which groweth vpon the brier or Eglantine before-named, haue no smell with them in the whole world naturally, but are brought to it by many deuises & sophistications: yea, & the very Rose it selfe, which of the own nature is odoriferous, carrieth a better smell in some one soile than in another. For at Cyrene they passe all other for sweetnes and pleasant favor.

fauor: which is the reason that the oile Rosat, and ointment compounded thereof, is most excellent there of all other places. And at Cartagena in Spain there be certaine timely or hastie Roses, that blow and floure all winter long. The climat also and temperature of the aire makes for the sweetnesse of the Rose: for in some yeares yee shall haue them lesse odoriferous than in others.ouer & besides, the place would be considered: for the roses be euer more sweet growing vpon dry than wet grounds. And indeed the Rose bush loueth not to be planted in a fat and rich soile, ne yet vpon a vein of cley, no more than it liketh to grow neere vnto riuers where the banks be ouerflowed, or in a waterish plot; but it agreeth best with a light and loofe kinde of earth, and principally with a ground full of rubbish, and among the ruines of old houses. The Campain Rose bloweth early and is very forward. The Milesian comes as late. Howbeit those of Præneste be longest ere they giue ouer bearing. As touching the maner of planting them: as the ground would be deluded deeper than for corn, so a lighter itich had need be taken than for Vine sets. Those that be sowed of seed be latest of all others ere they come vp, and thriue most slowly. [Now lieth this feed in the cup or husk thereof iust vnder the very floure, and is covered all ouer with a down.] And therefore it is better to set sions cut from the stalk, or els to slip the little oilets and shoots from the root, as the maner is in reeds and canes. After which sort they vse to set, yea & to graf one kind of a prickly & pale rose bush, putting forth very long twigs & shoots like to those of the Cin-q-foile rose, which is one of the Greekish kind. There is no rose bush whatsoeuer, but prospereth the better for cutting, pruning, yea and burning. Moreover, it loueth to be remoued and transplanted as well as the Vine, and by that meanes will it come to the proof and beare best. As for the sets or sions, they ought to be foure fingers long or more above the ground, when they be first put into the earth, to wit, after the occultation of the brood Hen star. Then would they be translated in Februarie, at what time as the Western wind Favonius is aloft, and replanted with a foot distance one from another: but they require to be euer and anon digged about the root. They that desire to haue Roses blow betimes in the yeare, before their neighbours, vse to make a trench round about the root a foot deep, and poure hot water into it, euen at the first when the bud of the Rose beginneth to be knotted.

CHAP. X.

¶ Of Lillies three kinds: and the maner of planting or setting them.

NEXT to the Rose, there is not a fairer floure than the Lilly, nor of greater estimation. The oiles also and ointments made of them both haue a resemblance and affinitie one to the other. As touching the oile of Lillies, the physitians call it Lirinon: & if a man should speake truly, a Lilly growing among Roses becommeth and beautifieth the place very well; for it beginneth then to floure when Roses haue halfe done. There is not a floure in the garden again that groweth taller than the Lilly, reaching otherwhile to the height of three cubits from the ground: but a weak and slender neck it hath, and carieth it not streight and vpright, but it bendeth and noddeth downward, as being not of strength sufficient to beare the weight of the head standing vpon it. The floure is of incomparable whitenesse, diuided into leaues, which without-forth are chamfered, narrow at the bottom, and by little and little spreading broader toward the top: fashioned altogether in maner of a broad mouthed cup or beaker, the brims or lips wherof turn vp somewhat backward round about, and lie very open. Within these leaues there appeare certain fine threds in maner of seeds: and iust in the midst stand yellow chiuies like as in Saffron. As the colour of the Lilly is twofold, so carieth it a double smell; one in the leaues which resembleth the cup aforesaid, and another in those strings or chiuies; howbeit the difference is not much. Now for to make the oile and ointment of Lillies, the leaues also are not reiected.

There is an herb named in Latine Convolvulus [i. with wind] growing among shrubs & bushes; which carieth a floure not vnlike to this Lilly, saue that it yeeldeth no smell, nor hath those chiuies within: for whitenesse they resemble one another very much, as if Nature in making this floure, were a learning and trying her skill how to frame the Lilly indeed.

Now Lillies be set and sowed after the same maner in all respects as the Roses, and grow as many waies. This vantage moreouer they haue of the roses, That they will come vp of the verie liquor that distilleth and droppeth from them, like as the herbe Alifanders: neither is there in the

A the world an herb more fruitful, in so much as you shall haue one head of a root put forth oftentimes fise hundred bulbes or cloues.

There is besides a red Lilly, which the Greeks in their language call Crinon: and some name the floure of it Cynorrhodon. The excellent Lilly of this kind groweth in Antiochia & Laodicea, cities both in Syria: the next to that is found in Phaselis. In a fourth place, is to be set the Lilly growing in Italy. There are besides, purple Lillies, which otherwhiles rise vp with a double stem: these differ from the rest only in the pulpos root which they haue; and the same carrie a great bulbe in one entire head, and no more: such they call Daffodills. A second sort there is of these Daffodills with a white floure, & a purple cup or bel within. Herin differ Daffodills from Lillies, for that the Daffodil leaues be toward the root, & namely those in the best mountains of Lycia; whereas in Lillies they put forth in the stalk. The third kind agreeth in all points with the rest; but that the cup in the midst of the floure, is of a grasse greene. All the sort of them be late ere they floure, and begin not to blow before the retreat of the star Arcturus, and about the Autumn Equinox: but such are the monstrous deuises of some fantastical spirits, that they inuented forsooth a new kind of artificiall * coloring and dying of Lillies: for which purpose, in the month of Iuly they gather their stems, when they begin to wither, & hang them vp in the smoke to drie. Now when the knobs or heads of their roots looke once bare and are shor out from the said stalks, (which commonly falleth out in the month of March) they infuse & steep them in the lees of deepe red wine, or some Greekish wine, for to suck and drinke in the colour thereof: which done, they set them in little trenches, whereinto they poure certaine hemines or

B pints of the said wine: and by this means become the Lillies aforesaid, purple. A strange and wonderfull matter that any root should take a tincture so deep, as to bring forth a floure of the same die and colour.

CHAP. VI.

¶ Of the Violet and the Marigold: of Bacchar, and Combretum: of Azara-bacca, and Saffron.

IN the third ranke of floures, be ranged the * Violets: whereof be many kinds: to wit, the purple, the yellow, and the white. All of them may be set of plants, like as worts, and garden pot-herbs. But of those which naturally come vp & grow of their own accord in leane grounds, and those exposed to the Sunne, the purple [March] Violets, they haue a broader leafe than the rest, & those spring immediatly from the root, which is pulpos and fleshy. These alone be distinct from the rest by a Greek name, and are called * Ia, whereupon purple cloth is likewise of them named Ianthina. But of those which are sowne or set by hand, the * yellow beare the greatest name aboue all other. These floures be distinguished into diuers kinds, namely, into the Tuscan Violets; and those of the sea, which haue a broader leafe but are not so sweet as others. Some smell not at all, to wit, the * Calathian Violet with the small leafe, a floure this is that Autumne yeeldeth, whereas the rest doe flourish in the Spring.

E Next vnto the Violet, are the Marigolds, all of one colour. In number of leaues this floure passeth the Sea-violet aforesaid, which neuer exceedeth fise: but in recompence of that defect, this Violet goeth beyond the Marigold, in sweet fauour, for the Marigold carrieth a strong sent with it and an vnpleasant. As for the hearb called * Scopia regia, it hath a smell nothing milder than it; although the leaues (to say a truth) doe smell, and not the floures.

Bacchar is named by some Rustick: Nard: this plant hath nothing in it odoriferous and senting well, but the root. Of which root, (as Aristophanes an auncient Comical Poet testifieth in one of his Comedies) they were wont in old time to make sweet perfumes and odoriferous compositions for their ointments: whereupon some there be who call the root Barbarica, but falsly; for deceived they are. The fauour that this root doth cast, draweth very neere to the sent of Cinamon. It loueth a leane and light soile, and in no wise commeth vp in a moist ground.

F As touching the hearb named Combretum, it resembleth the same very much: howbeit the leaues be passing small and as slender as threds, but the plant it selfe is taller than Bacchar: well, rest we must not in the description of these hearbes and floures only, but also we are to reforme and correct their error, who haue giuen to Bacchar the name of Nard-rustick: For there is another hearbe properly so called, to wit, that which the Greeks name Afaron, [i. A. fara-bacca, or

* Inficendi.

* Note that Viole in Plinie and other authors, reacheth to our Stock-gilliflowers, wall-flowers, and other floures, as to the purple March Violet. * Chius or Wal-floures. * Some take it for a kind of Foxe-gloue.

* Which some take for yellow Yarrow.

Fole.

Fole-foot,] a plant far different from Bacchar, as may appear by the description therof, which I haue set down among the sundrie kinds of Nardus. And verily I do find, that this plant is named * Afarum, because it is neuer vsed in making of guirlands and chaplets.

* *Son. n. cupit,*

Concerning Saffron, the wild is the best. To plant it within any garden in Italie, is held no good husbandry, for it will not quit cost, considering there is neuer a quarter set therewith, but it asketh a * scruple more in expence, than the fruit or increase commeth to, when all the cards be told. For to haue Saffron grow, you must set the cloues or bulbous heads of the root: and being thus planted, it prooueth larger, bigger, and fairer than the other: howbeit sooner far it doth degenerate and become a bastard kind: neither is it fruitfull and beareth chiues in euerie place, no not about Cyrene, where the goodliest floures of Saffron in the world are to be seen at all times. The principal Saffron groweth in Cilicia, and especially vpon the mountain Corycus there: next to it, is that of Lycia, and namely vpon the hill Olympus: and then in a third degree of goodnesse, is reckoned the Saffron Centuripinum in Sicily: although some there bee, who attribute the second place vnto the saffron of the mount * Phlegra. Nothing is so subject to sophistication as Saffron, and therefore the only triall of true Saffron indeed, is this. If a man lay his hands vpon it, he shall heare it to cracke as if it were brittle and readie to burst: for that which is moist (a qualitie comming by some indirect means and cunning cast) yeeldeth to the hand and makes no words. Yet is there another prooffe of good Saffron, If a man after hee haue handled it, reach his hand vp presently to his mouth, & perceiue that the aire and breath therof smiteth to his face and eyes, and therewith fretteth and stingeth them a little, for then he may be sure that the saffron is right: there is a kind of garden saffron by it self, and this commonly is thought best, and pleaseth most, when there appeareth some white in the mids of the floure, and thereupon they name it Dialeucon, whereas contrariwise this is thought to be a fault and imperfection in the Corysian Saffron, which is chiefe: and indeed the floure of it is blacker than any other, & soonest fadeth. But the best simply in any place wherfoeuer, is that which is thickest and seemes to like best, hauing besides short chiues like hairs: the worst is that which smelleth of mustines. *Mutianus* writeth, that in Lycia the practise is to take it vp euerie 7 or 8 yere, and remove it to a plot of ground wel digged and delued to a fine mould; where, if it be replanted, it will become fresh again and young, whereas it was ready before to decay and degenerate. Nowse there is in (any place) of Saffron floures in garlands; for the leaues are small and narrow, in manner almost of threads. Howbeit with wine it accordeth passing well, especially if it be of any sweet kind: and being reduced into powder and tempered therewith, it is commonly sprinkled ouer all the theatres, and filleth the place with a perfume. It bloometh at the setting or occultation of the star Vergilia, and continueth in floure but few daies: and the leaf driueth out the floure. In the mids of winter, it is in the verdure and al green, and then would it be taken vp and gathered: which done, it ought to be dried in the shadow, and the colder that the shade is, so much the better. For the root of Saffron is pulpous and full of carnositie; and no root liueth so long about ground as it doth. Saffron loueth a life to be trampled and trod vpon vnder foot: and in truth, the more injurie is done vnto it for to mar it, the better it thriueh: and therefore neare to beaten paths, and wells much frequented, it commeth forward and prospereth most.

CHAP. VII.

¶ Of the floures vsed in old time about coronets and guirlands: the great diuersitie in aromaticall and sweet smelling simples. Of *Saluunca* and *Polium*.

Saffron was (no doubt) in great credit and estimation, during the flowring estate of Troy; for certes, the Poet *Homer* highly commendeth these three floures, to wit, Melilot, Saffron, and Hyacinth. Of all odoriferous and sweet senting simples, nay of all hearbes and floures wharfoeuer, the difference consisteth in the colour, the smell, and the juice. And note this to begin withall, that seldome or neuer you shall meet with any thing sweet in sent, but it is bitter in tast; and contrariwise, sweet things in the mouth, be few or none odoriferous to the nose: And this is the reason that wine refined, smelleth better than new in the lees; and simples growing wild, haue a better sauer far than those of the garden. Some floures, the further they be off, the more pleasant is their smell: come nearer vnto them, their sent is more dull and weaker than it

was

A was, as namely Violets. A fresh and new gathered rose casteth a better smell afar off than neere at hand; let it be somewhat withered and dry, you shall sent it better at the nose than farther off. Generally, all floures be more odoriferous and pleasant in the Spring, than at any other season of the year: and in the morning they haue a quicker and more piercing sent, than at any houre of the day besides: the neerer to noon, the weaker is the smell of any herb or floure. Moreover, the floures of new plants are nothing so sweet as those of an old stock: and yet I must needs say that floures smell strongest in the mids of Summer. As for Roses and Saffron floures they cast the pleasanter smell if they be gathered in cleare weather, when it is faire and dry about head: and in one word, such as grow in hot countries be euer sweeter to smell vnto, than in cold Climates. Howbeit in *Aegypt* the floures haue no good sent at all, by reason that the aire is foggie and mistie, with the dewes rising from the riuer Nilus. Moreover, certain floures there be that are sweet and pleasant enough, yet they stiffe and fill the head. Others, so long as they be fresh and green, haue no smell at all, for the excessiue abundance of moisture within them; as we may perceiue in Fenigreek, which the Grecians call Buceros. Many floures cast a quick and liuely smell, and yet are not without good store of juice, but moist enough, as violets, roses, and saffron: but such as are destitute of such moisture, and yet their sent is piercing and penetrant, they all of them be of a strong sauer also, as for example the Lilly of both kinds. Sothernwood & *Margeram* haue a hot and strong sauer. Some herbs there be which yeeld no smell nor goodnes at all but in their floure only, for all their other parts be dull and good for nothing, as violets and roses. Of garden herbes, the strongest of smell be alwaies dry, as Rue, Mints, and Ach or Parsley: likewise are all such as grow in dry places. Some fruits, the elder they be and the longer kept, the sweeter is their sauer, as Quinces: and the same Quinces degard smell better when they be gathered, than if they hung still vpon the tree and so preferred. Others there are, that vnles they be broken, bruised, rubbed, and crushed, haue no smell: and ye shall haue those that cast no sent at all, vnlesse their rind or bark be taken off: as also such as except they be cast into the fire and burnt, yeeld no sauer, as Frankincense and Myrrhe. Furthermore, all floures being bruised, are more bitter than they were vntouched and vnhanded. Some after they be dry retain their odor longest, as the Melilot. There are that make the place sweeter where they grow, as the floure de lis, inso much as it perfume the whole tree (wharfoeuer it is) the roots whereof it toucheth. The herb *Hesperis* smells more by night than day, whereupon that name was deuised. * There are no liuing creatures which yeeld from their bodies a sweet sauer, vnlesse we giue credit to that which hath bin reported of the Panthers.

* *Plinie* neuer
heard of the
Musk-goats
nor *Chier* cats
in these daies.

Furthermore this would not be passed ouer as touching the difference of odoriferous plants and their floures, in this respect, that many of them are neuer employed to the making of Guirlands and chaplets, as namely the Floure de lis and Nard Celtricke, *Saluunca*, which although they yeeld both of them an excellent sauer, yet are not vsed that way. But as for the * Flour de lis, it is the root only therof that is comfortable for the odor: as if Nature had made the plant it selfe to serue only for physick vses, and compositions of sweet perfumes. The best Floure de lis is that which groweth in Illyricum or Sclauonia; and not in all parts thereof, not (I say) in the maritime coasts, but farther vp into the main, among the mountaines and Forrests of Drilo and Narona. The next to it in goodnes commeth out of Macedon, and it hath the longest root of all others, but slender withall and whitish. In the third place is to be ranged the floure de lis of Africk or Barbary, which as it is the biggest in hand, so is it also the bitterest in tast. As touching the Illyrian Ireos, there be two sorts of it; namely, *Rhaphanitis*, which is the better of the twain, so called for the resemblance that it hath to the Radish root. The second they name *Rhizotomos*, and it is somewhat reddish. In sum, the best Ireos, if a man do but touch it will prouoke sneezing. The stem of the Floure de lis groweth straight and vpright to the height of a cubit. The floure is of diuers colours, like as we see in the rainbow, whereupon it took the name Iris. The Ireos of *Pisidia* is not reiected, but held to be very good. Moreover, they vse in Sclauonia to be very ceremonious in digging vp the root of floure de lis; for 3 moneths before they purpose to take it forth of the ground, the manner is to poure meade or honied water round about the root in the place where it groweth, hauing before-hand drawne a threefold circle with a sword's point; as it were to curry sauer with the Earth, & make some satisfaction for breaking it vp and robbing her of so noble a plant: and no sooner is it forth of the ground, but presently they hold it vp aloft toward heauen. This root is of a feruent & caustick nature, for in the very

* Commonly
called *Ireos* is

handling it raiseth pimples and blisters in maner of a burn, vpon their hands that gather it. **A** G
 nother ceremonie also they haue in gathering thereof, for none must come about this worke,
 but such as haue liued chaste and not touched a woman: this (I say) about all is obserued most
 precisely. This root about all others is most subiect to the worme, for not onely when it is dry,
 but also while it is within the earth, it quickly commeth to be worme-eaten. In old time the
 best Irinum or oile of Ireos was brought from the cape of Leucas and the city of Elis in Boeo-
 tia; for planted it hath bin in those parts many a yeare. But now there is excellent good com-
 meth out of Pamphylia: howbeit that of Silicia, and namely from the Septentrionall parts is
 most highly commended.

As for the plant Saliunca or Nard Celtick, ful of leaues verily it is, yet they be so short, that
 handfomly they cannot be knit and twisted for garlands: a number of roots it putteth forth, to
 which the floure or herbe groweth close: for surely a man would iudge it all herbe rather than
 floure, as if it were platted and pressed flat to the root with ones hand; and in one word, resem-
 bling a very thick tuft of grasse by it selfe. This herb groweth in Austria and Hungarie, also
 among the Morici, and the Alps on the Sun side. As for that which commeth vp about the ci-
 tie Eporthedia, it is so pleasant and odoriferous, that there is as much seeking after it as if it
 were some precious metall; and it yeeldeth a reuenue to the City no lesse than some metall
 mine. And in very truth, a singular herbe it is in a wardrobe to lie among good cloathes, for to
 get them a most pleasant and commendable smell.

Another plant there is which the Greekes vse likewise in their Wardrobes, called Polium.
 This herbe *Museus* and *Hesiodus* the Poets extoll and set out to the highest degree; for they re-
 port that it is good for all things that it shall be employed about, but principally, that it auai-
 leth much to win men fame, renown, promotions, and dignities.ouer and aboue which vertues,
 miraculous it is (if it be true which they say) * that the leaues thereof in the morning seeme
 white, about noon purple, and at the Sun-setting blew. Two kinds there be of it, one groweth in
 the plains & champian grounds, and is the greater: another in the woods, and is the lesse. Some
 call it Teuthrion. The leaues resemble the gray haire of an old man, springing directly from
 the root, and neuer passe in height a hand bredth. Thus much may suffice concerning odorife-
 rous floures.

CHAP. VIII.

¶ The colours of Cloth resembling those of Floures, and strining with them for the better. Of **K**
Amarantus or *Passe-velours*: of *Chrysocome* or *Chrysis*.

THe excessiue ryot and prodigall superfluitie of men is grown to this passe, that hauing ta-
 ken no small pleasure in surmounting the natural savor of simple floures, by their artifi-
 cial odors and compound perfumes; they canot rest so, but must proceed also in the craft
 and myserie of dying cloth, to challenge the fairest floures in the garden, and to match, if not
 to surpasse, the liuely colours of Natures setting. Of these tinctures I finde that there be three
 principal: the one in grain, which striueth with that bright orient colour in Roses; and there is
 not a more pleasant thing to the eye, than to see the Scarlet or purple of Tyros, or to behold
 the double died Dibapha, or the Laconian purple. The second rich dy stands vpon the Ame-
 thyst colour, and resembleth the March violet: this also beareth much vpon that purple, which
 of the said violet is called Ianthinus: for now I handle dies and colors in general terms, which
 neuertheless may be subdivided into many other speciall sorts: The third is ordinarily made
 of the purple & porcellane shel-fishes, and that in diuers & sundry maners; for of this tincture
 there are cloathes which incline much to the colour of Turnsole; and of these some be many
 times of a deeper and fuller dy than others. Also there is another sort which standeth much on
 the Mallow floure, inclining to a purple; and a third sort which resembleth the violet that com-
 meth late in the yere [called the purple stock-gillofre] and indeed this is the freshest & richest
 color that can be died out of those fishes aforesaid. Certes, the tinctures & dies now adaies are
 so liuely, as wel for simple colors as mixt and compound (such artificiall means are deuised by
 our sumptuous gallants) than in this strife of Nature and art together, a man shal hardly iudge
 whether of them haue the better hand. As touching yellow, I finde that it is a most antient co-
 lour, and highly reputed of in old time: for the wedding vail which the Bride ware on her ma-
 rying day, was all of yellow, and women only were permitted to vse them: which might wel be
 the

* Diose, repor-
 tet this of
 Tripolium, and
 not of Polium:
 wherby it see-
 meth that Pli-
 ny is in a fault.

A the cause that this color is not reckoned among those that be principall, that is to say, common
 as well to men as women: for the wearing and vsing of colours indifferently by the one and the
 other, is that which hath giuen them their name and speciall credit. Howbeit, doe what we can
 for all our skill and industry we must giue place without all doubt to the purple floure gentle,
 for we cannot reach possibly to the color thereof. Now to say a truth, a purple Spike rather this
 is than a floure, and the same altogether without any smell. Of a strange and wonderfull nature
 this is: it loues of all things to be cropped, and the more it is plucked, the better it commeth a-
 gaine: it beginneth to spike or put out the floure in the month of August, and continueth vntill
 Autume. The best is that of Alexandria, for after it is gathered, it will keep the fresh and liuely
 colour still. This maruellous propertie it hath by it selfe, That when all other floures doe faile
 and are gone, if it be wet in water it looketh fresh againe; and for want of others, serues all win-
 ter long to make chaplets & guirlands. The chiefe and principall vertue that it hath, is shewed
 in the very name *Amaranthus*, for so it is called in Greeke, because it neuer doth fade or wither.

B But to come again to our artificiall colors, we haue one that answereth to the floure named
Cyanos, i. blew bottle: likewise to the yellow golden floure *Elichryson*. Verily none of all these
 floures or colors were in request in the daies of *K. Alexander* the Great, for the Greeke authors
 who wrot next after his decease, haue made no mention at al of them, whereby it is plaine, that
 they grew into a name & liking since their time: howbeit no man needs to make doubt or ques-
 tion, That found out they were first by the Greekes: for how els should it be, that their names
 which be meere Greekish, are currant here in Italy? Howbeit this cannot be denied, that Italie
 hath giuen name to the hearb *Petilium*, which floureth in Autumne, groweth about briers and
 brambles, and is only commendable for the colour sake, which is much like to the wild Rose
 or Eglantine: the leaues of which floure be small, and no more than fiae. A wonderfull thing to
 be noted in this floure, That the head should bend and nod downward so, as vnlesse it bee thus
 (as it were) wreathed and bowed, the said leaues will not shew out of a small cup or vessell of
 fundrie colours, and enclosing within it a yellow seed.

As touching a dafie, a yellow cup it hath also, and the same is crowned as it were with a gar-
 land consisting of fiae and fifty little leaues, set round about in manner of fine pales. These bee
 floures of the meadow, and most of such are of no vse at all; no maruell therefore if they be name-
 lesse: howbeit some giue them one tearme, and some another. As for *Chrysocon* or *Chrysis*,
D no Latine denomination it hath at all: an hearbe it is, growing an hand-breadth high, putting
 forth certaine buttons (as it were) in the head, glittering as bright as gold, with a black root, ta-
 sting harsh and yet sweetish withall: it groweth commonly in places full of stones & shadowy.

CHAP. IX.

¶ The excellencie of Chaplets and Guirlands: of *Cyclaminus*, and *Melilot*: of
Trifolie or *Clauer*, and three kinds thereof.

NOW that we haue gone through in manner the principall dies and richest colours that be
 it remaineth that we passe to the treatise of those Guirlands, which being made of diuers
 colored floures, in regard only of that varietie, are delectable & pleasing to the eye. And
 considering that some of them stand vpon flours, others of leaf, they may be all reduced to two
 principall heads. Among flours, I take to be all kinds of broom (for from them there be gather-
 ed yellow floures) and the Oleander. Item, the blossoms of the Iubbe tree, which also is called
Cappadoeia, for they resemble much the odor of the oliue blooms: as for *Cyclaminus*, i. Sow-
 breed, it groweth among bushes, whereof more shall be said in another place: a purple Colof-
 lian floure it carries, which is vsed to beautifie & set out game-coronets. To come now to chap-
 lets made of leaues; the fairest that goe vnto them be * *Smilax* and *Iuy*, and therein also their
 berries interlaced among, do make a goodly shew aboue al: of which we haue spoken at large in
 the treatise of shrubs and trees. Many kinds there are besides of plants proper for this purpose,
 which we must be faine to expresse by Greeke names, forasmuch as our countrey men haue not
 bene studious in this behalfe, to giue any Latine names to the greatest part of them: besides,
 most of them are meere strangers in Italy, and grow in forraign parts: howbeit, looked for it will
 be at our hands that we should enter into the discourse of them also, for that our purpose & de-
 signe reacheth to all the works of Nature, and is not limited & confined within the bounds of

* Bindweed.

* *Vitis alba*, of
some: *Glycyphyl-
lon Dodonaei*,
of others,
* *Viburnum
Maishii*.

Italy. Well then, to begin withall, * Melothron, Spireon, Trigonon, * Cneoron, which *Higinius* calleth *Casia* (afford leaues very meet to make chaplets: so doth *Conyza*, called otherwise *cunilago*; *Melysophyllon* named also *Apiastrum*, *Bawme*; and *Melilot*, which wee commonly terme *Sertula Campana*; & good reason, for the best in Italy is that of *Campaigne*: & in Greece, that which groweth in the promontory *Sunium*. Next to these the *Melilot* of *Chalcis* & *Candie* is wel accepted of: but grow it in what country it wil, rough thickets and woods it delighteth most in. And that of this hearb they were wont vsually in old time to make garlands, may appeare by the very name *Sertula*, which it took therupon, and retaineth still. In sauer & floure both, it commeth neare to *Saffron*: the hearbe otherwife of it selfe is hoary and gray. The best *Melilot* is counted that which hath thortst leaues, and those most plumpe and fattie withall. Semblably, the hearbe *Trifoile* or *Clauer*, hath leaues which go to the making of coronets and guirlands. And hercof there be three kinds: the first is that which the Greeks call *Mynianthes*, others *Asphaltion*, hauing a bigger leafe than the rest; an hearbe that garden-makers commonly vse: the second with a sharpe leafe, called thereupon *Oxytriphylon*: the third, which is least of al other. Among these *Trifoiles*, I cannot but aduertise the reader, that some there be which haue strong and firme stems: as nervous as those of garden *Fennell* and *Fennell wild*, yea and as stiffe as those of *Myophonos*. But to returne againe to our chaplets, there bee employed about them, both the maine stalkes of *Ferula*, as also the berries and purple floures of the *Iuie*. There is besides a kind of them, like vnto the wild roses: and in them verily the colour only is delectable, for odour they haue just none. To conclude, of *Cneoron* there be two kinds, the blacke and the white: both well branched and full of leaues, but the white is most odoriferous: and as well the one as the other, doe flourish after the *Aequinox* in Autumne.

CHAP. X.

¶ Of *Oryganum*, and *Thyme*: of the Athenien honey: of *Conyza*, and *Iupiters*.
floure, of *Southernwood* and *Camomile*.

As many sorts also there be of *Origanum*, seruing to make guirlands: as for one of them, it hath no seed; but the other which is sweet, is called *Origan* of *Candy*. In like manner, two kinds there be of *Thyme*, to wit, the white and the blacke: this hearb doth flourish about the Summer Solstice, at what time as Bees also begin to gather honey from it: and according to the flourishing of it more or lesse, a man may guesse ful wel what season there wil be for honey: for honey-masters and such as keep Bees, hope to haue a good yere of honey when they see the *Thyme* to bloume abundantly. *Thyme* canot well away with rain, and therefore it taketh harme by shoures and sheddeth the floure. *Thyme* seed lyeth so close, that vnneeth or hardly it can be found; whereas the seed of *Origan*, notwithstanding it be exceeding smal, is euident enough and may soone be seene. But what matter maketh it, that Nature hath so hidden the seed, considering it is wel known, that it lyeth in the very floure, which if it be sowe, commeth vp as well as any other seed? See the industrie of men, and how there is nothing but they haue made trial of and put in practise! The honey of Athens carieth the name for the best honey in the world, by reason of the *Thyme* growing thereabout. Men therefore haue brought ouer into other countries, *Thyme* out of *Attica*, although hardly and with much ado (being sown thus in the floure as I haue said) it commeth vp. But there is another reason in Nature, why it should thriue so badly in Italy, or elsewhere, considering that the *Atticke* *Thyme* wil not continue & liue, but within the aire and breath of the sea. Certes this was an opinion receiued generally of our ancient fore-fathers, That no *Thyme* would doe well and prosper, but neere vnto the Sea, which should be the cause, that in *Arcadia* there is none of it to be found. And in those daies also, men were verily persuaded, that the *Oliue* would not grow but in the compasse of three hundred stadia from the Sea side: howbeit, in this our age verily we are aduertised and know for certain, That in *Languedoc* and the prouince of *Narbon*, the very stonie places are all ouergrowne and couered with *Thyme*, vpon which there are fed thousands of sheepe and other cattaille: in such sort, as this kind of herbage and pasturage, yeeldeth a great reuenuie to the inhabitants and payants of that country, by ioynting and laying in of the said beasts brought thither out of far remote parts for to feed vpon *Thyme*.

Concerning the hearbe *Conyza*, which goeth also to the making of Chaplets, there be two kinds

A kinds likewise of it, namely, the male & the female. And these differ onely in leaues: for those of the female *Conyza* be thinner, smaller, narrower, and growing closer together than the other of the male, which indeed branch and spread abroad more, lapping one ouer another in manner of creft tiles. The floures also of the male *Conyza* is more bright and liuely: howbeit, both the one and the other floure late, and not before the rising or apparition of the star *Arcturus*. The male carrieth a strong sent: but that of the female is more penetrant; in which regard the female is better for the bite and sting of venomous beasts. The leaues of the female, smell of *Hony*. The root of the male, is by some called *Libanotis*, whereof we haue already written.

As touching these herbs following, * *Dios Anthos*, Majoran, the day *Lillie* *Hemerocalles*, *Southernwood*, *Elecampane*, water *Mints*, and wild running *Thyme*, as also all which do branch and put forth shoots as *Roses* do, such serue only in lease for garlands. As for the said *Iupiters* floure or *Dios Anthos*, particularly, there is nothing in it but the colour to commend it; for sauer it hath none, no more than another herb which the Greeks call *Phlox*. As for the rest, their floures and branches both be odoriferous, except the running wild *Thyme*.

Elecampane, named in Greeke *Helenium*, sprang first (as men say) from the teares of *Ladie Helena*: and therefore the best *Elecampane* is that which groweth in the Island of *Helena*. The plant is raised like vnto wild *Thyme*, spreading & running low by the ground with little branches, nine inches or a span long.

Southernwood doth flourish in Summer, and carrieth a sweet and pleasant sauer, howbeit, the head it somewhat stuffeth and offendeth. The floure is of a golden colour. And say, that it carrieth neither seed nor floure, yet commeth it vp of it selfe in void and vacant places altogether neglected and without any culture, for it doth propagat and increaseth by the tops and tips of the branches lying vpon the ground, and so taking root. And therefore it groweth the better if it be set of root or slip, than sowed of seed. For of seed, much adoe there is to make it come vp: and when it is aboue ground, the yong plants are removed and set, as it were in *Adonis* gardens, within pots of earth; and that in Summer time, after the maner of the herb and floure *Adonium*: for as well the one as the very tender, and can abide no cold: and yet as chill as they be, they may not away with ouer-much heat of the Sun, for taking harme. But when they haue gotten head once and be strong enough, they grow and branch as * *Rue* doth.

Much like vnto *Southernwood* in sent and smell, is *Camomile*: the floure is white, consisting of a number of pretty fine leaues set round about the yellow within.

CHAP. XI.

¶ Of *Marioram*, the greater and the lesse, called in Latine *Amaracus* or *Sampsuchum*. Of *Nyctygetum*, *Melilot*, the white *Violet*: of *Codaminum*, and wild *Bulbes*: of *Heliochrysum*, and *Lychnis* or *Rose Campain*. And of many other herbs growing on this side the sea.

Diocles the Physitian, and the whole nation in maner of the Sicilians, haue called that herb *Amaracus*, which in Egypt and Syria is commonly named *Sampsuchum*. It commeth vp both waies, as well of seed as of a slip and branch. It liueth and continueth longer than the herbs before named, and hath a more pleasant and odoriferous sent. *Marioram* is as plentiful in seed, as *Southernwood*: but whereas *Southernwood* hath but one tap root and the same running deep into the ground, the rest haue their roots creeping lightly aloft and ab within the earth. As for all the other herbes, they are for the most part set and sowne in the beginning of the Autumne; some of them also in the spring, and namely in places which stand much in the shade, which soue to be well watered also and enriched with dung.

As touching *Nyctygetum* [or *Lunaria*] *Democritus* held it to be a wonderfull herb, and few like vnto it; saying that it resemblith the colour of fire, that the leaues be prickly like a thorne, that it creeps along the ground: he reporteth moreover, That the best kind thereof grows in the lad *Gedrosia*. That if it be plucked out of the ground root and all after the Spring *Aequinox*, and be laid to drie in the Moonshine for 3 daies together, it will giue light and shine all night long; also, That the *Magi* or *Sages* of *Persia*, as also the *Parthian* kings vse this herb ordinarily in their solemn vowes that they make to their gods: last of all, That some call it *Chenomychos*, because Geefe are afraid of it when they see it first; others name it *Nyctilops*, because in the night

* or *Iouis* Flou.
which some
take to be the
Columbines.

* *Helenium*
here described
agreeth not
with our *Ele-*
campane.

* *Ruta vicia*.

night season it shineth and glitter eth as farre off. As for Melilote, it commeth vpon euery where: **G** howbeit, the best simply & wherof, is made the greatest account, is in Attica: but in what place soeuer it growes, that is most accepted which is fresh & new gathered, not enclining to white, but as like vnto Saffron as is possible. And yet in Italie the white Melilote is the sweeter and more odoriferous.

The first floure bringing tidings of the springs approach, is the white bulbous stock-Gillofre. And in some warmer climates they put forth and shew euen in Winter. Next vnto it for their timely appearance is the purple March Violet: and then after them the Panse, called in Latine Flammea, and in Greeke Phlox, I meane the wild kind onely.

Codiaminon bloweth twice in the yeare, namely, in the Spring and the Autumne: for it cannot abide either Winter or Summer. Somewhat later than those before rehearsed, are the Daffodil and Lilly ere they floure, especially in countries beyond sea. [in Italy verily (as I haue said before) they bloum not till after Roses:] for in Greeke the Passe-floure * Anemone is yet more lateward. Now is this Anemone the floure of certain wild Bulbes, different from that other Anemone whereof I will speake in the Treatise of Physick-hearbs. Then followeth * Oenanthe, and Melanion, and of the wild fort Heliochryfos. After them, a second kind of Passe-flower or Anemone, called also Leimonja, beginneth to blow. And immediatly vpon it the pety Gladen or sword-grasse, accompanied with the Hyacinth: & last of all the Rose sheweth in her likenes. But quickly hath the Rose done, and none so soone, and yet I must except the garden Rose. Of all the rest, the Hyacinths or Harebells, the * stock-Gillo floure, and Oenanthe or Filipendula, beare floures longest. But of this Oenanthe, this regard must bee had, that the floures bee often picked and plucked off, and not suffered to run to seed. This groweth in warme places. It hath the very same sent that Grapes when they first bud and put out blossom, whereupon it took the name Oenanthe. But before I leaue the Hyacinth, I cannot chuse but report the fable or tale that goeth thereof, and which is told 2 maner of waies, by reason that the floure hath certaine veines to be seen running in and out, resembling these two letters in Greeke AI, plaine and easie to be read: which as some say, betoken the lamentable mone [*] that Apollo made for his wanton minion Hyacinthus whome he loued, or as others make report, sprung vp of the blood of Ajax who slew himselfe, and represented the two first letters of his name AI.

Helyachryfos beareth a yellow floure like to gold, a small and fine leafe, a little stalk also & a slender, but hard and stiffe withall. The Magi or Sages of Persia vse to weare this hearbe and floure in their Guirlands: and they be fully persuaded, that by this meanes they shall win grace and fauour in this life, yea, and attaine to much honour in glorie, provided alwaies, that their sweet compositions wherewith they annoint and perfume themselves, be kept in a vessel or box of gold, not yet fired nor purified in the fire, which gold they call Apyron. And thus much for the floures of the Spring.

Now succeed and come after in their rank, the summer floures, to wit, Lychnis, Jupiters flower or Columbine, and a second kind of * Lilly: likewise Iphyon, and that Amaracus or Marjoram, which they cal the Phrygian. But of all others, the flower Pathos is most louely & beautiful: whereof there be two kinds, the one with a purple flower like vnto the Hyacinth, the other is whiter, and groweth commonly in churchyards among graues and tombs, and the same holdeth on flourishing better, and liueth longer. The flower de-luce also is a Summer flower. These haue their time, fade, and are soone gone. And then come other flowers for them in their place in Autumne, to wit, a third kind of Lillie, and Saffron: But of both these, the one is of a dull or no sent at all: the other is very odoriferous, but all of them break out and shew abroad with the first shower of rain in Autumne. Our chaplet makers vse the floures also of Bedegnar or white Thistle in their Guirlands: and no maruell, since that our Cookes dresse the young tendrells and crops thereof, for to make a daintie dish for to content our tast and goe pleasantly downe the throat. Thus you see the order and manner of beyond-sea floures, how and when they come abroad. In Italy it is somewhat otherwise: for the Rose followeth immediatly after the violets: and when the Rose is in the mids of his ruffe, in comes the Lilly to bear him company. No sooner hath the Rose played his part, but the blew-blaw entereth the stage: and after him the Passveluer or floure-gentle. As for the Pervinck, it continueth fresh and greene all the yeare long: this hearbe windeth and runneth too, and fro with her fine and slender twigges in manner of threads or laces, and those beset with leaues two by two in order, at euery knot or joint.

Passing

* Pulsatilla or
Wind-floure.

* Filipendula
supposed of
some.

* or rather the
Wall flower.

* Some read
Cerynthus
rather.

A Passing good and proper indeed for vinet and stony worke in borders, arbors or knots, and meet for fine and curious Gardeners: howbeit, for default of other floures, the Garland-makers borrow a little of the law, and make vp their defects with a supply from it. The Greeks call it Chamadaphne.

The life of the white Violet or bulbous stock-Gillofre, is three yeares at most, and so long it holdeth the owne well, after that terme it doth degenerate and wax worier. The Rose-bush will continue five yeares, without cutting downe or burning (which are the meanes to maintaine it in youth still.) But as we haue already obserued, there lieth very much in the soile, which would be considered especially in floures: for in Egypt, none of all these about rehearsed, haue any odor or sent at all; and yet the Myrtle trees there, they alone carry a most sweet and pleasant favor. Moreover, in some tracts all these herbes and floures before named, do preuent in budding and blowing (two months) those of other places. As for Rose-rewes, the earth ought to be digged and opened about the roots, first presently vpon the coming of the Western wind Favonius in February, and then a second time about the Summer Solstice: to conclude, these would be looked vnto about all things, that before and between those times, they be kept well pruned and cleansed from all superfluities.

CHAP. XII.

* The order of nourishing and maintaining Bees. What meat is to be giuen them. Their diseases, and the remedies to them belonging.

C IN this discourse of ours concerning gardens and gay floures appertaining to Garlands, requisite it is to speak of bees and bee-hiues, which become the garden very well: considering the gain that commeth in so easily by them, especially when they stand and do well. In regard therefore of these bees, so beneficiall as they be, and kept with so small charges, a garden ought to be well planted and stored with Thyme, Baulme, Roles, Violets of all kinds, Lillies, sweet Trefoile, Beanes, Ervile, Cunila or Sauerie, Poppies, Conyza, Catia, to wit, Lauander and Rosemary, Melilote, Melissophyllum, and Cerinthe. This Cerinthe is an herb bearing white leaues, and those bending downward: it groweth a cubit high, and carrieth an hollow head, containing within it a certaine sweet liquor resembling honey: bees are most eager and greedy after the floure of this herbe, as also of Senuie, whereat we may well make a wonder, seeing that for certain they will not touch nor come neere to the blossome of the Oliue trees. And therefore good it is to set bee-hiues far enough from this tree. And yet of necessity some there would be planted neere vnto them, that when the bees do swarme or cast, they might haue a convenient place at hand to settle vpon, for feare they should flie too far from the hieue. The Cornell tree also is not good for bees, for if they chance to tast the floure thereof, they fall presently into a vehement lask, wherof the poore wretches (if they haue not help the sooner) die: and therefore it would not stand in their way. Howbeit, there is a remedy to cure them of this flux, namely, to take soruises and stamp them together with hony, and so to giue it them: to set vnto them either mans urine or beastes stale or els last of all to serue them with graines of the Pomgranate, besprinkled and drenched in wine of the Ammian grape: but if you set broome all about their hiues, you do them an high pleasure.

As touching their food and nourishment, I will tell you a wonderfull and memorable thing vpon mine own knowledge. There is a towne or Burgade called Hostilia, scituate vpon the riuer Po, the inhabitants of this village, when they see that their bees meat goeth low therabout, and is like to faile, take me their hiues with bees and al, and set them in certain boats or barges, and in the night row vp the said riuer Po against the streame five miles forward. The morrow morning out go the bees to seeke food and reliefe. Now when they haue met with meat, and fedde themselves, they returne againe to the vessels aforesaid: and thus they continue daily, although they change their place and haunt, vntill such time as their masters perceiue that the hiues bee full, by the settling of their boats low within the water with their weight, and then they returne home againe downe the streame, and discharge the hiues of the honey within.

CHAP. XIII.

¶ Of a certaine venomous and poisonfull honey. The remedies as well against the said Honey, as another kind that maketh folke besides themselves.

SEmblably in Spain they deale with their Bees & hiues vpon Mules backs in the like case, and carry them vp into the country for to be prouided of victuals. But here it would be considered by the way, what pasturage it is that they be put into: for there is some kind of food, which poisoneth all the honey that is gathered from it. At Heraclea in Pontus, in some yeares, all the hony that the Bees do make, is found to be venomous and no better than poison; and yet the same bees in other yerres gather good and wholsome hony. Howbeit, those authors who haue deliuered thus much in writing, haue not set downe what floures they be that yeeld this hurtfull hony: and therefore I thinke it not amisse to write what I haue found and knowne as touching this point. There is an herbe called *Ægolethron* in Greeke, which killeth horses verily, but Goats most of all, feeding therupon; and therefore it took that name: the floures of this herb, if it chance to be a wet and rainy Spring, do conceiue and ingender within them a certain deadly venome which doth corrupt and rot them. This may be a probable reason, that the foresaid mischief and bane is not alwaies felt alike. This poisonfome honey may be knowne by these signs: first it will neuer thicken but continue liquid still; secondly, the colour is more deep and reddish than ordinary; thirdly, it carrieth a strange sent or smell with it, and will cause one to sneeze presently; last of all, it is more ponderous and heavy than the good and harmlesse hony. The symptoms or accidents that insue vpon the eating of this honey, are these, They that haue tasted thereof, cast themselves vpon the ground and there fall a tumbling: they seek by all means they can to be cooled; and no maruell, for they run all to sweat, that one drop ouertakes the other. Howbeit, there be many remedies for this poison, which I will shew in place conuenient. Mean while, because a man would not be without some good thing ready at hand, since the world is so full of villany & set vpon such secret mischiefes, I must needs put down one good receit, and that is this: take honied wine that is old, mingle and incorporate it with the best hony you can meet withal, and Rue together: vse this confection at your need. *Item*, Eat much of saltfish, although it come vp again, and that your stomach do cast it. Moreouer, this hony is so pernicious, that the very dogs if they chance to lick vp any excrements that passe from the partie so infected (either by reaching, spitting, vomit, or seege) they are sure to be sped therewith, and to feele the like torments. Howbeit, the honied wine that is made therewith, if it may haue age enough and be stale, is knowne for a certainty to do no creature harm. And there is not a better medicine in the world, either to fetch out spots in womens faces, and make their skin faire and cleare (if it be applied with Costus;) or to take out the black and blew marks remaining after stripes in eye or elsewhere, so it be tempered with Aloe. Another kind of honey there is in the same region of Pontus, and namely among the Sanni (a people there inhabiting) which because it driueth folke into a fit of rage and madnesse, they call in Greeke *Mænomenon*. Some attribute the occasion hereof to the floure of the *Olcander*, whereof the woods and Forrests there be full. This nation selleth no hony at all, because it is so venomous and deadly: notwithstanding they do pay for tribute a huge masse of wax vnto the Romans euery yeare. Moreouer, in the kingdome of Persis, and in *Cetulia*, which lieth within *Mauritania Casariensis*, a country confining and bordering vpon the *Massefuli*, there be venomous hony-combs; yea, you shall haue in one hiue some hony combs full of poisoned hony, whereas others be found and good: a dangerous thing no doubt, and than which, there could be no greater deceit to poison a number of people; but that they may be known from the rest by their leaden and wan hew that they haue. What should we thinke was Natures meaning and intent by these secret sleights and hidden mischiefes, That either the same Bees should not euery yeare gather venomous hony; or not lay the same vp in all their combs differently? Was it not enough that she had bestowed vpon vs a thing, wherein poyson might be soonest giuen and least perceiued? Was the not content thus to indanger our liues, but she must proceed farther, enen to incorporat poison her selfe in hony, as it cometh from the Bee, for to empoison so many living creatures? Certes, I am of this mind and believe verily, That shee had no other purpose herein, than to make men more warie what they eat, and lesse greedy of sweet meats to content and please the tooth. For the very honey

honey indeed she had not generally infected with this hurtful quality, like as she had armed all Bees with sharp pricks and stings, yea, and the same of a venomous nature; and therefore against these creatures verily she hath not deferred and put off to furnish vs with a present remedy: for the juice of Mallowes or of Yvie leaues serueth to annoynt the stinged place, and keep it from rankling; yea, and it is an excellent thing for them that be stung, to take the very Bees in drink; for it is an approued cure. But this I maruell much at, That the Bees themselves, which feed of these venomous herbs, that cary the poison in their mouths, and are the makers of this mischief, can do escape and die not thereof? Whereof I can giue no reason at all, vnlesse dame Nature, that lady and mistresse of the world, hath giuen vnto these poore Bees a certaine Antipathy and vertue contrary vnto poison: like as among vs men to the *Mars*, and *Pysli*, shee hath imprinted (as it were) a repugnancy in their bodies, to resist the venome of all Serpents whatsoever.

CHAP. XIII.

¶ Of a certaine kind of honey which Flies will not touch. Of Bee-hiues. How to order the same, and namely when Bees want meat and are in danger to be famished. The manner also of making Wax.

HERE is in Candy another strange and wonderful thing, as touching hony, gathered about the mountaine *Carina*, which taketh nine miles in compasse: within which space, and circuit of ground, there is not a Flie to be had; and the honey there made, Flies wil not touch in any place wherefoeuer. By which experiment, this honey is thought to be singular for medicines, and therefore choise is made thereof before any other.

As touching Bee-hiues, they ought to stand on the open side vpon the *Æquinoctiall* Sunne rising, that is to say, when the daies and nights be equall. And in any wise, regard would be had, that they open not in the North-east, and much lesse the full West. The best Bee-hiues be made of barks and rinds of trees: the second in goodnesse be those of *Ferula* or *Fennell*-geant. In the third place are such as be wrought of oifier twigs. Many haue made them of Talc, which is a kind of transparent glasse stone, because they would see through them how the Bees do worke and labor within. Daubed they should be if they were well serued, both without & within with Oxe dung. The couer and lidde thereof ought to be moueable and haue liberty to play vp and down behind, that it may be let down far within-forth, in case either the hiue be too large & of greater receit in proportion than the Bees are in number, for feare they should slack their work and giue ouer their trauell, despairing euer to fill the same, seeing it so big and of so great capacity, and being thus let downe (to make their hiue seem the lesse) it must be gently drawn vp again by little & little, that the Bees may be deceiued thereby, & not perceiue how their worke grows vpon them. In Winter time Bee-hiues should be couered with straw: & oftentimes perfumed with beasts dung especially; for this is agreeable to their nature.ouer and besides, it killeth the wicked vermin that breed in them, Spiders, Butterflies, and Wood-worms; yea, and this property it hath moreouer, to stir vp and quicken the Bees, and make them more liuely and nimble about their businesse. As for the Spiders aforesaid, they verily are not so harmful, & be soon destroyed: but the Butterflies do the more mischief, & are not so easily rid away. Howbeit there is a way to chase them also, namely, to wait the time when the Mallow doth begin to blossom, to take the change of the Moone, and chuse a faire and cleare night, and then to set vp certaine burning lights just before the Bee-hiues: for these Butterflies will couer to flie into the flame. But what is to be done, when you perceiue that the bees do want victuals, then it will be good to take dry Raisins of the Sun and Figs, to stamp them together into a masse, and lay it at the entry of the hiue. *Item*, It were not amisse to haue certain locks of wool well rouzed and carded, and those wet & drenched in cuir either foddren to the thirds, or to two thirds, or els soaked in honied wine, for them to settle vpon and suck. Also to set before them in their way the raw carcases of Hens, naked and pulled to the bare flesh. Moreouer, there be certain Summers so dry and continually without raine, that the fields want floures to yeeld them food, and then must they be serued with the foresaid viands, as well as in Winter season. When hony is to be taken forth of the hiues, the holes and passages for the ingresse and egress of the bees ought to be well rubbed and besmeared with the herb *Melissophyllon* and *Genista* bruised and stamped: or else the hiues must be compassed about in the midst with branches of the White Vine, for

* Considering that of a beasts carcase they will be engendred.

for feare left the Bees depart and flie away. The vessels whereout hony hath been imploied, yea, and honey combes, would be well rinced and washed in water; which being thoroughly sodden, maketh a most wholesome and excellent vineger.

As touching wax, it is made of the combes after the hony is pressed and wrong out of them. But first they must be purified and clenfed with water, and for three daies dried in some darke place: vpon the fourth day they are to be dissolued and melted vpon the fire in a new earthen pot neuer occupied before, with so much water as will couer the combs: and then it should bee strained through a panie of reeds or rushes, which done, the wax is to be set ouer the fire a second time in the said pot, and with the selfe same water, and sodden again, and then it ought to run out of it into other vessels of cold water, but those first should be al about within annointed and besmeared with honey. The best wax is that which is called Punica, *i.* of Barbary, and is white. The next in goodnesse is the yellowest, and smelleth of hony, pure and clean without sophistication; such commeth from the country of Pontus; and verily I wonder much how this wax should hold good, considering the venomous hony whereof it is made. In the third place is to be ranged the wax of Candy: for this standeth much vpon that matter which they cal Propolis, wherof I haue already spoken in the Treatise of Bees and their nature. After all these, the wax of the Isle Corsyca may be reckoned in the fourth rank; which becaufe it is made much of the Box tree, is thought to haue a vertue medicinable. Now the making & working of the first and best Punick white wax, is after this manner: They take yellow wax, and turne it often in the wind without the house in the open aire; then they let it seeth in sea-water, and namely, such as hath bin set far from the shore out of the very deep, putting thereto Niter, this done, they scum off the floure (that is to say, the whitest of it) with spoons, & this cream (as it wer) they change into another vessel, which hath a little cold water in it. Then once againe they boyle it in sea-water by it selfe alone, and set the vessel by for to coole. After they haue done thus three times, they let it dry in the open aire vpon an hurdle of rushes, in the Sun and Moon, both night and day: and this ordering bringeth it to be faire and white. Now in the drying, for feare that it should melt, they couer it all ouer with a fine Linnen cloth. But if they would haue it to be exceeding white indeed, they seeth it yet once more, after it hath bin thus sunned and mooned. In truth, this Punick white wax, is simply the best to be vsed about medicines. If one be disposed to make wax black, let him put thereto the ashes of paper: like as with an addition of Orchanet it will be red. Moreouer, wax may be brought into all manner of colours, for painters, limners, and enamellers, and such curious artificers, to represent the forme and similitude of any thing they list. And for a thousand other purposes men haue vsed thereof, but principally to preferue their walls and armors withall. All other things as touching Hony and Bees, haue bin handled already in the peculiar Treatise to them and their nature belonging. Here an end therefore of Gardens and Gardinage.

CHAP. XV.

¶ Of herbes which come vp of themselves, and such especially as be armed with prickles.

It remaineth now to speake of certain wild herbes growing of their own accord, which in many nations serue for the kitchen, and principally in Ægypt; for this countrey, although it bee most plentiful in corne, yet may seem to haue least need thereof, and of all nations vnder heauen best able to liue without the same: so well stored it is with hearbs, wherof the people doth ordinarily feed: whereas in Italy here, we know as few of that kind good to be eaten, namely, Strawberries, *Tanus, Ruscus, Crestemarine or Sampire, as also Batis Hortensiana, which some call French Spurge: we haue also the wild Parsnep of the meadowes, and the Hop, but wee vse them rather for pleasure and delight, and to giue contentment to our tast, than for any necessary food to maintain life. But to come againe to Ægypt, there is to be found the noblest plant of all others, Colocasia, which some name Cyamos, *i.* the Egyptian beane: this herbe they gather and cut downe out of the riuer Nilus: it putteth forth a main stem, which being sodden, yeeldeth in the eating and chewing, a certaine threddy matter or woolly substance, drawing out in manner of a cob-web; but the stalk as it groweth vp amid the leaues, maketh a faire and goodly shew: for indeed the said leaues be exceeding large, and comparable to the broadest that any tree beareth, resembling those for all the world of the Clote or great Burrhe growing in our ri-

uers

A vers, which we cal Personata. A wonderful thing it is to see, what store they in Ægypt set by the commodities that their riuer Nilus doth afford: for of the leaues of this Colocasia (plaited & infolded naturally one within another) they make them cups of diuers forms and fashions, out of which they take no small pleasure to drink. And now adaeies this herb is planted here in Italy. Next to Colocasia, the Ægyptians make most account of that Cichory, which I named before, the wild and wandering Endiue, which herb commeth vp in that country after the rising of the Brood-hen star: it flourisheth not all at once, but bloweth by branches one after another: a supple and pliable root it hath, and therefore the Ægyptians vse it in stead of cords to binde withall. As for Anthallium, it groweth not in Nilus, but not far from the riuer: it beareth a fruit in bignesse and roundnesse resembling a Medlar, hauing neither kernell within, nor husk without: and the leafe of this plant is like to Cyperus, or English Galangale. This herbe they vse to eat, being first *dressed and prepared in the kitchen. They feed likewise vpon Oetum, a plant that hath few leaues and chose very small, howbeit a great root. Touching Aracida and Aracos, they haue many roots verily branching and spreading from them, but neither leafe nor herbage ne yet any thing els appearing aboue ground. And thus much of the chiefeest and greatest herbes of Ægypt serued vp to the table: the rest are common or vulgar, and euery mans ineat, by name, Condrylla, Hypochæris, Cautalis, Authriscum, Scandix (called by some Tragopogon, which beareth leaues like to Saffron,) Parthenus, Strychnum, Corchorus, and *Apacc, which sheweth his head about the Æquinox: also Acinos, and that which they name Epipetron, and it neuer beareth floure; whereas Aphace contrariwise neuer giueth ouer flourishing, but when one floure is faded and shed, another commeth vp, and this course it holdeth all Winter long; throughout the Spring also, euen to the heat of Summer. Many other herbes they haue of bale reckoning: but aboue all, they make greatest account of *Cnicus (an herbe not knowne in Italy) not for any good meat they find in it, but for the oyle drawne out of the seed thereof. Of this herb there be two principall kinds; to wit, the Wild, and the Tame: the Wild is subdiuided into two speciall sorts, the one of a more mild and gentle nature than the other, although the stalks of both be alike, that is to say, stiffe and streight vpright: and therefore women in old time vsed the stens thereof for rocks and *distaffes; wherupon some do call the herb Attractylis: the seed is white, big, and bitter. The second is more rough and hairy, creeping long on the ground, with stalks more musculous and fleshy, and carrieth a small feed. The herb may be ranged among those that be prickly: for so must herbes be diuided into such general heads, namely, that some be full of prickles, others cleane without and smooth. As for those which stand vpon prickles, they be subdiuided into many members and branches. And to begin with a kind of Spurge, called also Scorpio, it hath no leafe at all; but instead therof, prickles and nothing els: some therbe leaved indeed, but those are beset with prickles, as the Thistle, Sea-holly, *Liquorice, and Nettle: for the leaues of all these herbes be prickly & stinging withall. Others, besides their leaues, haue prickles also, as the *bramble, & Rest harrow or whin. Some be provided of prickles both in leafe and stalk, as Phleas, which others haue called Stœbe. As for Hippophacet, it hath a prick or thorne in euery joint: but the bramble Tribulus aforesaid, hath this property by it selfe, That the fruit also which it beareth, is set with prickles. Of all these sorts, the Nettle is best knowne, which carrieth certain goblets and concavities, and the same yeelding a purple kind of downe in the floure, and it riseth vp sometimes aboue two cubits high. Many kinds there be of these Nettles; namely, the wild Nettle, which some would haue to be the female, and this is more milde than the rest. In this wilde kinde is to be reckoned also, that which they cal Cania, and is of the twain more agree, for the very stalk will sting, and the leaues be purled as it were and jagged. But that Nettle which carrieth a stinking fauor with it, called is Herculanca. All the sort of them are full of feed, and the same blacke. A strange quality in these Nettles, that the very hairy downe of them (hauing no euident prickles sticking out) should be so shrewd as it is, that if one touch it neuer so little, presently there followeth a smarting kind of itch, and anon the skin riseth vp in pimples and blisters, as if it had been skalt or burnt: but well knowne is the remedie of this smart, namely, to annoint the place with oyle. Howbeit this biting property that it hath, commeth not to it at the beginning when it is new come vp, but it is the heat of the Sun that fortifieth this mordacitie. And verily in the Spring when the Nettle is young and peepeth first out of the ground, they vse to eat the crops therof for a pleasant kind of meat, and many be persuaded besides that it is medicinable, & therefore precisely & religiously feed thereupon.

K

* as Theophrastus saith, Caden in aether-deaco Zythv.

* Thought to be Dent de lion

* Cardamus, or bastard saffron: but Turnebus supposes it to be put for Cici, wherof commeth Oleum Cicinum. * Cal. al. though some read fufis, i. spinules.

* Glycyrrhiza, but this agreeeth not with our Liquorice. * Tribulus. * Acerabula.

* The fruit or berry wherof is Volutaminia

thereupon, as a preservative to put by all diseases for that present yeare. Also the root of the wild Nettle, if it be sodden with any flesh, maketh it to eat more tender. The dead nettle, which stingeth not at all, is called Lamium. As touching the herb Scorpio, I will write in the treatise of herbs medicinable.

CHAP. XVI.

¶ Of Carduus, and Ixine: of Tribulus and Anchusa.

The common Thistle is full of prickly hairs, both in leafe & stalk: likewise * Acorna, * Leucacanthos, Chalceos, Cnicos, Polyacanthos, Onopyxos, Ixine, & Scolymos. As touching the Thistle Chamæleon, it hath no prickles in the leafe. Moreover, these prickly hearbes are distinguished & different one from another in this, that some of them be furnished with many stems, and spread into diuers branches, as the Thistle: others againe rise vp with one maine stalk, and branch not as Cnecos. Also there be of them that be prickly only in the head, as the Eryngium or Sea-holly. Some floure in Summer, as Tetralix and Ixine. As for Scolymus, late it is also ere it blow, but it continueth long in the floure. Acorna differeth from it onely in the red colour and fattier iuice that cometh from it. Attraytis also might go for Scolymus, but that it is whiter and yeeldeth a liquor like bloud: whereupon there be some who call it Phonos, i. Murderer: this quality it hath besides that it senteth strong: the seed also ripeneth late, & not before Autumne: and yet this is a property common to all plants of this prickly and thistly kind. But all these herbs will come of seed and root both. As for Scolymus, it differeth from the rest of these Thistles herein, that the root, if it be sodden, is good to be eaten: besides, it hath a strange nature, for all the sort of them during the Summer throughout, neuer rest and giue ouer, but either they floure, or they apple, or els be ready to bring forth fruit: and look when the leaues begin to wither, their prickles lose their force and will not pierce.

Ixine * is a rare herb and season to be seen, and not found growing in all countries alike. Immediately from the root it putteth forth leaues plenty; out of the mids of which root there swel- leth out a bunch like an apple, but the same is couered with the foresaid leaues: in the very top of which fruit there is contained a gum of a pleasant tast, called the thistle Mastick. Touching the herb Cactos, which groweth also in Sicily and nowhere els, it hath a property by it self; the stalks whereof shooting from the root, creep along the ground, and it carrieth a broad leafe full of prickles and thorns; and indeed these stalks thus running vpon the earth, the Sicilians call Cactos, which they vse to keepe and preserve; and being thus condited also, they commonly eat, as very good meat. One stem it hath growing vpright, which they terme Pernix, as sweet & pleasant as the other, but it will not abide to be kept long. The seed thereof is couered with a certain soft down, which they call Pappos, which being taken off with the husk, there remaineth a tender kernell within, which they eat, & find it as delicat as the very heart of the Date tree top, which is called the Brain: and this pith aforesaid, the Sicilians name Ascalia.

The Caltrop thistle Tribulus, groweth not but in moory grounds and standing dead waters. Surely in other places, folke curse it as they passe by, the prickles and spurs stick out so dangerously: but about the riuers Nilus and Strymon, the inhabitants do gather it for their meat: the nature of this plant, is to lean and bend downward in the head to the water. The leafe resembles in form those of the Elme, and they hang by a long stele or taile. But in other parts of the world there be two other kinds of Tribulus: the one is leaved like vnto the Cichling pease; the other hath leaues sharp pointed; this second kind is later ere it floure, and commonly groweth about the mounds of clothes lying by villages and town sides; the seed lieth in a cod rounder than the other, and black withall; whereas the former hath a * sandy seed. Of these thorny and prickly plants, there is yet one kind more, namely Ononis, i. Rest-harrow; for it carrieth prickles close to the very branches; the leafe is like to Rue: the whole stalk throughout is set with leaues disposed in manner of a garland. This plant commonly groweth after corn, it * plagueth the plough, and yet there is much adoe to rid it out of a ground, so loth it is to die. Of plants that be prickly, some haue their stalkes and branches trailing by the ground, as namely that hearbe which they call Coronopus, i. Harts horn, or Buck-horne Plantaine: contrariwise, there stand vpright, Orchanet, the root whereof is so good to colour wax and wood red. And of such as be more gentle in handling * Camomile, Phyllanthus, Anemone, and Aphace. As for Crepis & * Aparite, their stalkes

* A kind of thistle: some call it Mans blond. * S. Mary's hille.

* Nonura visum est equum omnibus terris nascitur: Ex Theophrastus, which is clean contrary to Pliny.

* Spumelle, for onocrotas, in Theophrastus, is like the seed of Sesama. * And therefore it is called resista bouis, or resista uari, because it staith the draught of the Ox at plough.

* Antithus, i. Decret: so called, because the bitternesse decoueth many a one, looking like to a kind of Cichorie.

A stalks be all leafe. Moreover, this would be noted, that the leaues of herbs differ one from another, as well as in trees: some in the length or shortnesse of the stele whereto they hang; others in the breadth or narrownesse of the leafe it selfe; in form also, whereby you shal haue some cornered, others cut and indented; likewise in sent and floure, for some there be that continue longer in floueing than others, and blow not all at once, but one part after another, as Bassill, Tornfall, Aphaca, and Onocheile.

CHAP. XVII.

¶ The difference of herbs in their leafe: what hearbes they be that floure all the yeare long: of the Asphodell, Pistana, and Petie-Gladen or Sword-grasse.

Many hearbes there be as well as some trees, which continue greene and hold their leaues from one end of the yeare to the other, as Tornfol, and Adiantum or Capillus Veneris. Another sort there is of herbs that floure spike-wise, of which kind are Cynops, Alopecurus [i. Foxtaile] Stelephuros, which some call Ortyx, others Plantaine (of which I will write more at large among Physick herbs) and Thryollis. Of these, Alopecurus carrieth a soft spike, and a thick mossie down, not vnlike to Fox-tails, whereupon it tooke that name in Greeke: and Stelephurus resembleth it very much, but that the Foxtaile bloweth not all together, but beareth floures some at one time & some at another. Cichory and such like, haue their leaues spreading vpon the ground, and those put forth directly from the root, beginning to spring immediately after the apparition of the star Vergiliæ. As touching Parietary, there be other nations as well as the Egyptians, who feed vpon it: it took the name Perdicium in Latine, of the bird Perdix, i. the Partridge, that seeketh after it so much, and plucketh it out of the wals where it groweth: it hath many roots and the same thick. In like maner, the herb Ornithogale, i. Dogs onion, hath a small stem and a white, but a root, * halfe a foot long: the same is full of bulbs like onions, soft also, and accompanied with three or foure other spurs growing out of it. This hearbe they vse to seeth among other pot-herbs for potage. I will tell you a strange quality of the herb Lotos and of Ægilops; if their seed be cast into the ground, it wil not come vp in a yeare. As wonderfull is the nature also of the Camomile: for it beginneth to floure in the head, whereas all other herbes which blow not all at once, floure at the foot first. Notable is the Bur likewise

Catly after the apparition of the star Vergiliæ. As touching Parietary, there be other nations as well as the Egyptians, who feed vpon it: it took the name Perdicium in Latine, of the bird Perdix, i. the Partridge, that seeketh after it so much, and plucketh it out of the wals where it groweth: it hath many roots and the same thick. In like maner, the herb Ornithogale, i. Dogs onion, hath a small stem and a white, but a root, * halfe a foot long: the same is full of bulbs like onions, soft also, and accompanied with three or foure other spurs growing out of it. This hearbe they vse to seeth among other pot-herbs for potage. I will tell you a strange quality of the herb Lotos and of Ægilops; if their seed be cast into the ground, it wil not come vp in a yeare. As wonderfull is the nature also of the Camomile: for it beginneth to floure in the head, whereas all other herbes which blow not all at once, floure at the foot first. Notable is the Bur likewise and worthy to be obserued, I mean that which sticketh to our clothes as we passe by, the floure lieth close and groweth within the said Bur, and neuer appeareth without: forth it is I say as it were hatched within, much like vnto those liuing creatures that coue and quicken their egges within their belly. Semblably, about the city Opus there is an herb called Opuntia, which men delight to eat: this admirable gift the leafe hath, That if it be laied in the ground, it will take root; and there is no other way to plant this herb, & maintain the kind. As for Iasione, one leafe it hath and no more: but so lapped and infolded, that it seemeth as if they were many. Touching Condrylla, the herb it selfe is bitter; but the iuice of the root is hot and biting. Bitter also is Aphaca or Dent de Lion; as also that which is called Picris, which name it took of the exceeding bitternesse that it hath; the same floureth all the yere long. As for Squilla and Safron, they be both of a maruellous nature; for whereas all other hearbes put out leafe first, and then knit round into a stem, in those two a man may euidently see the stalk before the leafe. And in Safron verily, the said stalk thrusteth out the floure before it; but in the Sea-onion Squilla, first sheweth the stalk, and then afterwards the floure breaketh out of it. The same Squilla floureth thrice in the yeare, as I haue said heretofore, shewing thereby the three seasons of seednes. In the range of these bulbous and onion-rooted plants, some place the root of * Cyperus, that is to say, of Gladiolus [i. Petie-gladen, Flags, or Sword-wort,] this is a sweet root, and being sodden or baked with bread, it giueth it a more pleasant tast; & besides, it mendeth the weight of bread well if it be wrought & kneaded with it in dough. Not vnlike to it is that herbe which they call Thesion, but that the root is harsh and vnpleasant. All others of the same kind differ in leafe: the Asphodell hath long and narrow leaues, Squilla is broad leaved, and may be handled without offence; whereas the Gladen leafe is like a sword blade indeed, and keen-edged according to the name [both in Greek and Latine.] The Asphodell seed is good to be eaten, if it be parched or fried; so is the bulbous root of it also; but this should be roasted vnder the embers, & then eaten with salt and oile.ouer and besides, if it be stamped with figs, it is an excellent dish; and this

E both of a marvellous nature; for whereas all other hearbes put out leafe first, and then knit round into a stem, in those two a man may euidently see the stalk before the leafe. And in Safron verily, the said stalk thrusteth out the floure before it; but in the Sea-onion Squilla, first sheweth the stalk, and then afterwards the floure breaketh out of it. The same Squilla floureth thrice in the yeare, as I haue said heretofore, shewing thereby the three seasons of seednes. In the range of these bulbous and onion-rooted plants, some place the root of * Cyperus, that is to say, of Gladiolus [i. Petie-gladen, Flags, or Sword-wort,] this is a sweet root, and being sodden or baked with bread, it giueth it a more pleasant tast; & besides, it mendeth the weight of bread well if it be wrought & kneaded with it in dough. Not vnlike to it is that herbe which they call Thesion, but that the root is harsh and vnpleasant. All others of the same kind differ in leafe: the Asphodell hath long and narrow leaues, Squilla is broad leaved, and may be handled without offence; whereas the Gladen leafe is like a sword blade indeed, and keen-edged according to the name [both in Greek and Latine.] The Asphodell seed is good to be eaten, if it be parched or fried; so is the bulbous root of it also; but this should be roasted vnder the embers, & then eaten with salt and oile.ouer and besides, if it be stamped with figs, it is an excellent dish; and this

* Semipedali, Dioscor. hath Sesquipedali, a foot and a halfe.

* Cyperi, or rather Xyphi, de Pbaiani.

indeed (according to *Hesiodus*) is the only way to dresse it. Moreouer, it is said, that Asphodels planted before the gates of any ferme house in the countrey, preferue the place from all charms and forceries. *Homer* also the Poet hath made mention of the Asphodell. The root resembleth * *Navews* of a mean bignesse: and there is not another root with more heads, for oftentimes a man shal see 80 bulbs clustred in a bunch together. *Theophrastus* and all Greeke writers almost, and namely *Pythagoras* (the chiefe prince of Philosphers) describe this plant to haue a stem of one cubit in length, yea and oftentimes of two, with leaues like to wild Porret: and the sayd stem they called Anthericon; but the root, (i.) those bulbs resembling onions, Asphodelas: but our countrymen haue named in Latin, the stem *Albus*; but the root, *Hastula Regia*. This is the name also of the stalk, full of grains or berries; and thereof they would make two kinds [the male and the female.] Well, the stem of the Asphodell then, is commonly a cubit long, large and big, clean and smooth. Of this herb *Mago* hath written, and ordained, that it should be cut down in the going out of March and entrance of Aprill; namely, after it hath don flourishing, and before that the seed be swelled and grown to any bignesse: then vpon the fourth day after, when the said stems are slit and clouen, they must be laid abroad to drie in the Sunne: when they be dried, they ought to be made vp into knitchets or handfuls. He saith moreouer, that the Greeks name that herb *Pistana*, which we cal in Latin *Sagitta*, growing in marishes and moores among other fenny weeds. This also would he haue to be cut downe and gathered, betweene the Ides of May and the end of the month of October: then, to be pilled, and so to be dried by little and little with the moderat heat of the Sun. The same author giueth order likewise, that the other kind of *Gladiolus*, which they call *Cypiros*, which also is an herbe growing about lakes and meeres, any time within Iuly should be cut downe to the very root; and the third day after, to be dried in the Sun vntill it looke white; but euery day that it lieth abroad, it must be brought into the house before the Sun go downe, because all herbs growing vpon marish grounds, take harm by dewes in the night.

CHAP. XVIII.

¶ Of *Rushes*, six kinds; and of *Cyperus*: their medicinable vertues. Of *Cypirus*, and the sweet *Rush Scarnanth*.

M *Ago* writing of the *Rush*, commonly called *Marifcon*, saith, That for to twist and weaue into mats, it ought to be gathered out of the marish ground where it groweth, in Iune vntill mid-Iuly. As for the drying of it, the same order must be obserued in all points, as we haue set downe before in the discourse of other marais weeds. Hee maketh a second kinde of water *Rushes*, which I find to be called the sea *Rush*, and of the Greekes *Oxyschoenon*, i. the sharp *Rush*: which also is subdiuided into three other sorts; for there is the barren *rush*, called also the male, & in Greek *Oxys*: the female *Rush* bearing a black seed, which they call *Melancranis*. This is thicker than the other, fuller also of branches and tufts. And the third more than it, which is named *Holoschoenus*. Of all these, *Melancranis* commeth vp of the own seed, without any other kinds intermingled with it: but *Oxys* and *Holoschoenus*, grow both together out of one turfe. Of all others, the great *Rush* *Holoschoenus* is best for to be wrought in mats, and such like implements about an house, because it is soft and fleshy; it beareth a fruit hanging & clustering together in maner of fish spawn. As for that *rush*, which we called the male, it groweth of it selfe, by reason that his top fasteneth in the ground, and so taketh root by way of propagation: but *Melancranis* foweth her owne selfe, and commeth vp of seed; for otherwise their race would perish, considering the roots of them all euery yere dodie. These *Rushes* are vsed to make leaps and weels for fishers at sea, & fine & dainty wicker vessels: also candle-wick & matches; especially the marow or pitch within, which is so great (especially about the foot of the Alps reaching to the sea-side) that when a *Rush* is slit, there is found in the belly a pith almost an inch broad by the ruse. And in Egypt there be found *Rushes* so big, that they will serue to make sieues, rangers, and vans. In such sort, that the Egyptians can finde no matter for that purpose, better. Some there be, that would haue the triangled or three square *rush* *Cyperus*, to be a feuerall kind by it selfe. This *Cyperus*, many there be that cannot distinguish from *Cypirus*, by reason of the great affinity of their two names: but I mean to put a difference betweene them both; for *Cypirus* is the *Petrie-glader* or *Sword-grasse* (as I haue before shewed) with a bulbous

A or onion root: the best of which kind, groweth in the Island of Crete: next to it in goodnesse, is that of the Isle *Naxos*: and in a third degree, is to placed that of *Phoenice*: and indeed that of Crete or Candy, in * *whitenesse* and odor commeth neere to *Nard*. The *Naxian* *Cypirus* hath a quicker sent: the *Phœnician* *Cypirus* smelleth but a little: as for that in Egypt, it hath no fauor at all; for there also groweth *Cypirus*. But now to come vnto the properties thereof, it hath vertue to discusse and resolu hard swellings in the body. For now my purpose is to speake of their medicinable vertues, forasmuch as there is great vse in *Phyficke*, as well of such aromaticall simples, as odoriferous floures. As touching *Cypirus* therefore, I professe verily that I will follow *Apollodorus*, who forbiddeth expressly to take *Cypirus* inwardly in any drink: and yet he protesteth, that it is most effectually for them that be troubled with the stone, and full of gravel; but, by way of fomentation onely. He affirmeth moreouer, that without all doubt it causes women to trauell before their time, & to slip their vntimely fruit. But one miraculous effect thereof he reports, namely, that the Barbarians vse to receiue the fume of this herb into their mouth, and thereby wast and consume their swelled Spleens: also, they neuer go forth of dores, before they haue drunk a pipe therof in that maner: for persuaded they are verily (saith he) that by this means they are more youthful, liuely, and strong. He saith moreouer, that if it be applied as a liniment with oile, it healeth all merry-gals and raw places where the flesh is rubbed off or chafed: it helpeth the rank rammyth smel vnder the arm-holes; and without faile cureth any chilling, numbesse, and through cold. Thus much of *Cypirus*.

C As for *Cyperus*, a *Rush* it is (as I haue said) growing square and cornered: neere the ground it is white; toward the top, of a dark blackish green, and fattish: the vnder leaues that be lowest, are slenderer than leek-blades; the vppermost in the head, are smal, among which is the seed: the root is like vnto a black oliue, which if it grow long-wile, is called *Cyperis*, and is of singular operation in *Phyficke*. The best *Cyperus* is that which groweth amongst the sands in *Africke*, neere the temple of *Iupiter Ammon*: in a second rank, is that of *Rhodes*: in a third place may be ranged the *Cyperus* in *Thracia*: and in the lowest degree, that of Egypt. And hereupon came the confounding of these two plants, *Cyperus* and *Cypirus*, because both the one and the other grow there. * But the *Cyperus* of Egypt is very hard, and hath no smell at all; whereas in the other, there is a fauor resembling the very *Spikenard*. There is another herb also comming from the Indians, called * *Cyperis*, of a feuerall kind by it selfe, in forme like vnto *ginger*: if a man chew it in the mouth, it coloureth the spittle yellow, like as *Saffron*.

D But to come againe to *Cyperus*, and the medicinable properties therof, It is counted to haue a depilatory vertue for to feth off haire. In a liniment it is singular good for the excrecence of the flesh about the naile roots, or the departure and loosnesse therof about them; which both imperfections be called *Pterygia*: it helpeth the vlcers of the secret parts, and generally all exulcerations proceeding of rheumatick humors, as the cankers in the mouth. The root of *Cyperus* is a present remedy against the stinging of serpents, and scorpions specially. Taken in drink it doth desopilat & open the obstructions of the matrice: but if a woman drink too much thereof it is so forcible that it will drie the matrice out of the body. It prouoketh vrine, so as it expelleth the stone and grauell withall; in which regard also, it is an excellent medicine for the droppe. A liniment thereof is singular for cancerous and eating sores, but especially for those that be in the stomach, if it be annointed with wine or vineger tempered with it.

E As concerning the *rushes* before said, their root sodden in three hemines of water, vntill one third part be consumed, cureth the cough. The seed parched against the fire, and so drunk in water, staieth the flux of the belly, and stoppeth the immoderat course of womens moneths; but it procureth head-ach. As for the *rush* called *Holoschoenus*, take that part of it which is next the root, and chew it; then lay it to the place that is stung with a venomous spider, it is an approved remedie. I find one sort more of *Rushes*, which they call *Euripice*; and this property withal, That it bringeth one to sleepe: but it must be vsed with moderation, for otherwise it breedeth drowfinesse, sib to the lethargy. Now seeing I am entred into the treatise of *rushes*, I must needs set down the medicinable vertues of the sweet *Rush* called *Squinanth*; and the rather, because (as I haue already shewed) it groweth in Syria furnamed *Coele*. The most excellent *Squinanth* commeth out of *Nabatea*, and the same is knowne by the addition or syname *Teuchites*. In a second place is that of *Babylon*. The worst of all is brought out of *Africke*, and it is altogether without smell. *Squinanth* is round, of an hote and fiery * taste, biting at the tongues end.

The true Squinant indeed which is not sophisticated, if a man rub it hard, yeeldeth the smel of a Rose: and the fragments broken from it do shew red. As touching the vertues thereof, It resolueth all ventosities, and therefore comfortable it is and good for the wind in the stomack: also it helpeth them that puke vp choler, or reach and spit blood: it stineth the yex, causeth rifting and breaking wind vpward; it prouoketh vrine, & helpeth the bladder. The decoction thereof is good for womens infirmities, if they sit therein. A cerot made therewith, and dry rosin together, is excellent against spafmes and cricks that set the neck far backward.

As concerning Roses, the temperature thereof is hot; howbeit they knit the matrice by an astringent quality that they haue, and coole the naturall parts of women. The vse of Roses is twofold, according to the leafe of the floure, and the floure it selfe (which is the yellow.) The head of the Rose leafe, to wit, the white part thereof, is called in Latine Vnguis, i. the Nail. In the yellow floure aforesaid, are to be considered feuerally, the feed, the hairy threds in the top, the husk and pellicle that couereth the Rose in the bud, & the cup within: & every one of these haue their proper qualities & vertues by themselves. The leaues are dried, or the iuice is drawn and pressed out of them three waies: either all whole as they be, without clipping off the white nail, for therein lyeth the most moisture: or when the said nails are taken off, and the rest behind is infused in the sun, lying either in wine or oile within glasses, for oile rosat or wine rosat. Some put thereto salt, others mingle withall either Orchanet or Aspalathus, or els Squinant: and this manner of iuice thus drawne and prepared, is very good for the matrice, and the bloody flux. The same leaues, with the whites taken away, are stamped, & then pressed through a thicke linnen cloth into a vessell of brasse; and the said iuice is sodden with a soft fire vnto the consistence of hony: and for this purpose, choise would be made of the most odoriferous leaues.

CHAP. XIX.

¶ The medicinable vertues of Roses: of the Lilly and Daffodill, called *Lam. tibi.*
Of the Violet, of Bacchar, Combretum, and *Azarabacca.*

How wine of Roses should be made, I haue shewed sufficiently in the treatise of diuers kinds of wines. The vse of the iuice drawn out of Roses, is good for the eares, the cankers, and exulcerations in the mouth, the gums, the Tonsils or Amygdales, for gargarismes, for the stomack, the matrice, the infirmities and accidents of the tuil or fundament, and the head-ach. Taken alone, it is singular good for the ague; with vinegar, for to procure sleep, & to restrain the heauing of the stomack, and the offers to vomit. The ashes of Roses burnt, serue to trim the haire of the eiebrowes. Roses dried and reduced into powder, represseth the sweat betwene the * legs, if it be strewed vpon the place. Dried Rose leaues do represseth and stay the flux of humors into the eies. The floure [which is the yellow in the mids] procureth sleepe. The same taken inwardly with vinegar & water, stayeth the immoderat flux of women; and the whites especially: also it represseth the reaching and spitting of blood. The pain of the stomack it appeaseth, being taken in three cyaths of wine. The seed or fruit of the Rose (which is of a Saffron colour) is best, so it be not about a yeare old, and the same dried in the shade. As for the black, it is nought and good for nothing. To rub the teeth with this feed, easeth the toothach: the same prouoketh vrine. Being applied to the stomack, it is comfortable: & so it helps *S. Antonies* fire, if it hath not run too long. If it be drawn vp by the nostrils, it purgeth and clengeth the head. As for the heads or knobs, if they be taken in drinke, they knit and bind the belly, and withall, do stay the flux of blood vpward. The whites or nails of the Rose leafe be singular for waterish eies, so they be applied dry with bread crumbs: the leaues verily if they be brought only into a liniment, and outwardly applied, are reputed foueraigne for the queasinesse and pain of the stomack, for the gnawings and other accidents which the belly and guts be subiect vnto; also for the Midriffe and other precordiall parts. Moreover, they are good to be eaten, if they be condite and preferred in manner of garden Dock or Patience. But in keeping of Rose leaues, an eie would be had to them, for fear least they grow to a mouldinesse, that quickly will settle vp them. Drie Rose leaues are of good vse in Physick, yea, the very Rose cake after the iuice & moisture is pressed out of the leaues, serueth for some purpose. For of them be made bags and quilts, yea, and drie pouders for to represseth sweat, and to palliat the strong smel therof: with this charge and cauet, that presently after that one is come out of the stouue or baine, the pouders be suffered to dry vpon

A vpon the body, and then afterward washed off with cold water. The wild Rose * leaues reduced into a liniment with Beares greafe, doth wonderfully make haire to grow again, where through some decaye it is fallen away.

Lilly roots through their singular vertues and operations many waies, haue ennobled their own floures: for first and formost, if they be taken in wine, they be countrepoysons against the sting of serpents, and the venom of Mushrooms. Sodden in wine, and applied in manner of a cataplasme, and so bound to the feet, they mollifie and resolue the cornes; but this must not be vndone and removed in three daies. Boiled with greafe or oile, they cause haire to come againe euen in places that were burnt. If Lilly roots be drunk in honied wine, they do euacuat downward at the siege with other ordure, the cluttered, bruised, and hurtfull blood within the body.ouer and besides, in this manner they help the spleen, them that are bursten and bruised, & withall, bring down womens terms orderly. But if they be sodden in wine, and so laid to in forme of a cataplasme, they knit and heale sinues that were cut asunder. They rectifie running tertars and lepries, they scour away dandruf and pilling skales in the face, they make the skin smooth and take away riuels and wrinkles. The leaues of Lillies boiled in vinegre are good to be layed to green wounds: reduced into a cataplasme with Hony, Henbane, and wheat meale, incorporate and vnited all together, and so applied to the cods, they represseth the flux of humors falling to those parts. The seed made into a liniment allayeth the heat of *S. Antonies* fire. And in the same sort for the floures and leaues applied doe heale old sores. As touching the iuice which is pressed forth of the floures, of some it is called Mel [i. hony:] of others Syrium: singular good for to soften and mollifie the matrice, for to procure sweat and to ripen impostumes tending to suppuration.

Now for Daffodils, there be two kinds of them admitted by the Physitians for to be vsed in medicine; the one with a purple floure, the other of a grasse green. This later Daffodil is aduerser and hurtfull to the stomack, and therefore causeth it to overturn and vomit: it setteth the belly also into a flux: contrary it is to the sinues, and stuffeth the head: for which narcotick qualitie of stupifying & benumbing the senses, it took the name in Greeke Narcissus, of Narce which betokeneth nummednesse or dulnesse of sence; and not of the yong boy *Narcissus*, as the Poets do feign and fable. The roots as wel of the one as the other Daffodil, haue a pleasant tast as it were of honied wine: the same is good for burns, applied to the place with a little hony: and so it helpeth dislocations and healeth wounds. Moreover, a cataplasme made of it, hony, and oatmeale, doth resolue and ripen biles and great apostemations: and in that sort it drawes forth spils, shiuers, arrow heads, and thorns, and whatsoever stick within the body. Being stamped and incorporat with barley groats and oile, it cureth them that be bruised and smitten with a stone. Mingled with meale it cleareth wounds, it scoureth the skin from all spots that disfigure it, yea and taketh away the black morpew. Of this floure is made the oile Narcissinum, good to supple and soften all hard tumours, good also to reuiue and heat againe whatsoever is stark and benumbed with extreme cold. And about all, this floure is excellent for the eares, howbeit it maketh the head to ake.

Of Violets there be some wild and of the field: others domesticall, and growing in our gardens. The purple violets are refrigeratiue and do coole. And therefore a good liniment is made of them to be applied vnto an hot stomack, against burning inflammations. A frontall likewise may be made of them to be laid vnto the forehead. But a peculiar vertue they haue besides to stay the running and waterie eies: as also to help the procidence or falling downe both of tuill and matrice, and to reduce them again into their places. Moreover, being applied to swellings and impostumations, they resolue the same without any head or suppuration. Guirlands being made of violets and set vpon the head, resist the heauinesse of the head, and with stand the overturning of the brains vpon ouer-liberall drinking; yea, the very smel thereof will disperse such fumes and vapors as would trouble and disquiet the head. Violets being drunk with water, doe cure the Squinancie. That which is purple in the floure of the Violets, helpeth the falling euil, in children especially, if they drink it with water. Violet seed resisteth the poison of scorpions. Contrariwise, the floure of the white Violet, to wit the bulbous stocke-Gilloffe, is good to break all impostumat swellings, whereas March violets did resolue them. But as wel the white Violets as the yellow wall-floures, are singular good to extenuate the grosse blood of womens terms, and to moue vrine. Violets, if they be fresh and new gotten, are not so effectuall for these purposes.

* or rather the
spongie sub-
stance grow-
ing vpon the
Cane brier
and wild Rose.

purposes as the dry and old gathered, and therefore they would haue a whole yeares drying before they be vsed. The wall-floure being taken to the quantitie of halfe a cyath in three cyaths of water, stirreth womens fleurs, and draweth them downe. A liniment made with the root and vinegre together, do mitigate and allay the paine of the spleen: likewise it asswageth the gout: and being tempered with myrrh and saffron, it is singular for inflammations of the eyes. The leaues mixed with hony cleanse the head from scurfe and skall: reduced into a cerot, it healeth vp the chaps in the seat or fundament, as also all such Fissures in any moist place whatsoever. And with vinegre they be good for all collections of humors and apostemations.

Bacchar also is an herb whereof there is good vse in physick. Some of our countrymen haue called it in Latine Perperisa. It affoordeth a good remedie against serpents: it qualifieth the excessiue heat of the head, allaieth the ach, and restraineth the flux of humours downe into the eyes. A cataplasme is made thereof for womens breasts, swelling immediatly after childbirth, for to breake the kernell. Also for fistulous vlcers, beginning to breed betwene the corners of the eies and of the nose, and Saint *Antonies* fire. The very odour thereof is a good inducement to sleep. The root foddren and taken in drinke is singular for them that are troubled with cramps and convulsions; that haue fallen from on high, that be drawn together with spasmes, and finally for such as labor for wind. A decoction made of three or foure of the roots, boiled away to the thirds, is giuen with good successe for an old cough. And this drinke or Iuleb is very conuenient for to purge women that haue trauelled and bin deliuered before their time. It taketh away the stiches in the side, cureth the pleurisie, and skoureth the stone. Herof be bags and quilts made, and those if they be laid in a wardrobe among cloathes and apparel, causeth them to smell sweet.

As for Combretum (which I said was much like vnto Bacchar) if it be beaten to powder and tempered with hogs greafe it maketh a soueraign salue that healeth wounds wonderfully. *Afarum* (by report) is an appropriat medicine for the liuer, if an ounce of it be taken in one hemine of honied wine. It purgeth the belly as violently as Ellebore. In case of the dropie it is singular; as also for the midriffe, precordial parts, the Matrice, and the Iaunise. If it be put into new wine when it worketh, and so tunned vp, it maketh a singular diuretick wine for to prouoke vrin. It must for this purpose be digged out of the ground when the leaues begin to put forth. Dried it ought to be in the shade; although it be subiect to corruption and mouldeth very soon.

CHAP. XX.

¶ Of French Nard, and Saffron. The medicinable vertues of Saffron, and the cake or dregs thereof. Of *Saliunca*, *Polium*, and *Floure de-lis*. Of *Holochryson*, *Chrysocome*, and *Melilot*.

Forasmuch as some haue taken rustick-Nard to be the root of Bacchar, and so named it: the which hath put me in mind of French Nard, and the promise which I made in my treatise of strange and forein trees, to put off no longer than this place for to speake of it, and the properties thereto belong. To acquit my selfe therefore, I will here set down the vertues of the said Nard, as touching the vse thereof in Physicke. First therefore, if two drammes of French Nard be taken in wine, it is singular against the sting and biting of serpents. *Item*, if one drinke it either in wine or water, it causeth the passions of the Collick, proceeding from the inflammation of the gut Colon. In like sort it cureth the inflammation of the liuer and the reins, the ouerflowing also of the gal, and the Iaunise thereupon. Taken alone by it selfe or with Wormewood, it is a good remedy for the Dropie. It represseth the immoderat flux of womens fleurs.

As touching Setwall or Valerian, which in the foresaid place we named Phu; the * root either beaten into powder, or foddren and so giuen in drinke, is excellent for the rising of the Mother, which threatneth suffocation; for the pains of the breast and pleurisie. The same prouoketh the course in womens terms, so it be taken in wine.

Saffron will not resolue nor be mixed wel with hony or any sweet thing. Howbeit, in wine or water, it wil dissolue very soon and be incorporated therewith. A soueraign spice this is, & singular for many maladies. The best way to keep saffron is within a box of horn. It discusseth verily all inflammations, but principally those of the eies, if together with an egge it be applied in forme of a liniment. Excellent it is for the suffocation of the matrice, the exulcerations of

A of the stomacke, breast, kidnies, liuer, lungs, and bladder: and more particularly, if any of these parts be enlamed, a proper remedie also it is in that case. Likewise it cureth the cough & pleurisie. It killeth an itch, and prouoketh vrin. Our wine-knights when they purpose to sit square at the tauerne and carouse lustily, if they drinke Saffron, neuer feare surfeit nor the ouerturning of their braine: and they are verily persuaded, that this keepeth them from drunkenesse, and maketh them carie their drinke well. Certes, a Chaplet of Saffron vpon the head, dooth allay the fumes ascending vp thither, and preuent drunkenesse. Saffron induceth sleep, but it troubleth the braine * somewhat it pricketh forward to wanton lust. The floure of Saffron reduced into a liniment with white Fullers earth, helpeth the Shingles and *S. Antonies* fire. And saffron it self entereth into very many compositions of Physicke. One Collyrie or * eye-salue there is, which B taketh the name also of saffron. And when the ointment made of Saffron called *Crocini*um, is strained and pressed out, the grounds which remaine is named *Crocomagma*, which also is not without some speciall vses, for it cureth the suffusion of the eyes, or the cataraet: but it causeth ardeur and heat of vrine more than Saffron it selfe. The best is that accounted, which if a man tast in his mouth, doth colour his spittle and staine his teeth.

As touching the Flower de-lis, the red is thought to be better than the white. Certes if little infants do wear it tied about them by way of necklace, collar, or girdle, it is supposed to be a singular remedie, especially when they breed teeth or haue the chincough. Also if they be troubled with the * worms, they hold it good gently to inskill the same in the body [either by drinke or clystres.] All other operations that the Flour-de-lis hath, differ not much in effect from hony. A singular property it hath to cleanse the head from sores and skalls, and generally to mundifie all impostumat vlcers. Two dramms thereof taken with hony, causeth the belly, & prouoketh to the stoole. Giuen in ordinary drinke, it staieth the cough, appeaseth wrings, & dissolueth ventrosities in the belly. In vinegre it openeth the opilations of the spleene. And being taken with water and vinegre together, it is an effectuell remedie against the stinging of serpents and spiders. The weight of two dramms eaten with bread or drunk in water, resisteth the poison of scorpions. Being made into a liniment with oile, and so applied, it cureth the bitings of mad dogs, and heareth the parts mortified with extreame cold. In like manner also it allaieth the paines of the sinews. Reduced into an ointment with Rosin, it is singular for the paine of the loins and the gout *Sciatica*. This root is hot in operation. If it be drawne or snuffed vp into the nose, it causeth sneezing, and purgeth the head. A liniment of it and Pome. quinces or Peare-quinces, causeth the head-ach: it represseth also the vapours flying vp into the head, causing distemperature of the braine, in a surfeit of wine or strong drinke. It helpeth streightnesse of breath, and such as cannot take their winde but sitting vpright. It prouoketh vomit, if it be taken to the weight of 2 Oboli. A cataplasme of it and hony together, draweth forth spils of broken bones. The powder of it is much vsed for Whit-flawes: and the same applied with wine, taketh away cornes and werts: but it must lie on three daies before you vnbind and take it from the place. The very chewing of it, correcteth a strong and stinking breath: as also the filthie saour of the arme-holes. The iuice thereof doth mollifie all hard tumors. It prouoketh sleepe, but it consumeth sperme or natural feed. The Fissures in the seat, as also the blind and swelling piles in the fundament and all superfluous excrecences of the bodie, it cureth.

There is a wild kind of Floure-de-lis, which some call *Xyris*: the root of this herb is good to resolue & discuss the swelling kernells named the Kings euil, hot biles, & risings in the groin. Howbeit for to work these effects, there be certain ceremonies precisely to be obserued, namely, That it be taken out of the ground with the left hand in any case. *Item*, that they who gather it do say in the gathering, For whose sake they pluck it vp; and withall, name the person: & here in making mention of this matter, I cannot but detect the knauery of these Harbarists and simplers: Their maner is not to employ & occupie all that they haue gathered, but reuerue & keep part thereof, as also of some other hearbes, as namely of Plantaine, and if they be not well contented, nor thinke themselves paid thoroughly for their paines in the cure, they make no more ado but burie and couer within the earth that part which they kept by them, in the same place where it was digged forth. And I beleue verily they haue an vnhappy meaning and a certaine kind of witchcraft herin: for sooth, That the maladies which they seemed to haue healed, should breake out and be sore again, to the end that they might be fet on work anew. As touching *Saliunca*, the decoction of it in wine and so taken, staieth vomits, and corroboreth the stomack.

* Nay it is a great enemie vnto it.
* *Dia croctis*.
* *Fallacis*.

* *Tinearum* vnto it. Plinie commonly it taketh *Tineas* for worms in the belly: although otherwise it be broken into sores and skalls in the head.

Musæus and *Hesiodus* the Poets haue a great opinion of Polium: for they giue counsell to all those that would come to preferment & promotion, for to be anointed all ouer with a liniment thereof: such also as be desirous of renowne and glory, to be euer handling of it, to set it also, and maintaine it in their gardens. True it is, that folke do carie Polium about them ordinarily, or lay it vnder their beds for to chafe away serpents. Physicians do seeth it either new & green, or drie, in wine, and therof make a liniment: or els they giue it to drink in vinegre, to those that be pained with the jaundise; yea, & to such as be newly fallen into the dropsie, they giue counsell to drinke the decoction thereof, being sodden in wine. And of it so prepared, they make a liniment for to be applied vnto green wounds. Moreouer, this herb is very good to fend out the after-burden in women newly brought to bed, and to expell the dead infant out of the mothers wombe. And otherwise it serueth well to mitigate any paines of the body. It doth purge and euacuate the bladder: and in a liniment applied to the eyes, restraineth their excessiue watering. I know not any other hearbe better to goe with other ingredients into antidots or countrepoisons (named of the Greeks *Alexipharmaca*) than this. Howbeit, some denie all this, and are of opinion that it is hurtful to the stomacke, that the drinking of it stuffeth the head, and causeth women to fall into labor before their time. They say also, that this cerimonie would be precisely obserued, That in the very place where this plant is found, so soone as euer it is gathered it should be hanged presently vpon the necke of the partie, with a speciaall care that it touch not the ground first, and then is it an excellent remedie for the cataract in the eye. And these authors describe this hearbe to haue leaues like Thyme, but that they be softer and couered ouer with a more hoarie and woollie downe. Being taken with wild Rue in raine water, so that it be beaten before into powder, it doth mitigat (by report) the deadly paines caused by the sting of the Aspis, it bindeth and draweth vp a wound, it keepeth corrosiue fores from festering and going farther, as well as the floures of the Pomegranate.

The hearb *Holochrysol* if it be taken in wine, helpeth the strangury, and such as cannot pisse but by drops. And a liniment therof is passing good to repress the flux of humors to the eyes. If it be incorporat with Tartar or wine lees burnt into ashes, and drie Barley groats, it mundifieth the skin, and riddeth away ring-wormes, tetter, and such like wild fires.

As for *Chryfocome*, the root of it is hot, and yet astrigent. It is giuen to drinke for the diseases of the liuer and the lights. And being sodden in honied water, it assuageth the paines incident to the matrice. It prouoketh womens monthly purgation: and being giuen in drink raw, it purgeth waterie humors gathered in the dropsie.

Touching *Baulm*, which the Greeks call *Melittis* or *Melissophyllon*: if Bee-hiues be rubbed all ouer and besmeared with the juice thereof, the Bees will neuer away, for there is not a floure whereof they be more desirous and faine, than of it: and in truth, looke in what garden there groweth abundance of this hearbe, the Bees therewhen they swarme, will be soone intreated to tarry, & not be hastie to wander far abroad. The same is a most present remedy not only against their stings, but also of wespes, spiders, and Scorpions. And being tempered with a little nitre, it is singular against the strangulation of the mother. Taken in wine, it pacifieth the wrings and torments of the belly. The leaues therof being sodden with salt, and brought into an ointment, are singular good for to be applied vnto the scrophules or swelling kernills called the Kings euill: and likewise to the accidents of the seat and fundament, as the swelling hemorrhoids or piles. The juice taken in drinke, bringeth women to their ordinary monethly courses: it discurseth veuosities, and healeth vlcers: it allaieth the paines of any gouts, and cureth the biting of mad dogs: it is good for the bloudy flux that hath run on a long time: as also those fluxes which proceed from the imbecillitie of the stomack: it helpeth them that be streight in the chest, and cannot take their wind but bolt vpright: it mundifieth also the vlcers within the breast. To conclude, it is said to be a singular remedie & none like vnto it, for to dispatch the webs in the eye, if they be annointed with the juice thereof and honey tempered together.

Melilot is thought also to be good for the eyes, if it be applied with milk or line seed. It assuageth also the paine of the jawes and head, if it be laid too with oile of Roses: likewise it doth mitigat the paine of the ears, if it be instilled or dropped into them with wine cuir. Moreouer, the tumors and breaking out of the hands it helpeth. Being boiled in wine or stamped green, it easeth the griefe of the stomacke. The same effect it hath in the pain of the matrice. But if the cods be amisse, if the Longaon or tuill bee fallen, and beare out of the bodie; or if that part bee

A affected with other accidents, Bath the place with a decoction of it, boiled greene in water or cuir, and the patient shal find ease. But if there be an ointment made of it and oile of Roses incorporat together, it is a souerain remedie for all cancerous fores. If it be boiled first in sweet wine or cuir, it is the better for the purpose aforesaid: and so prepared, a speciall and effectuaill thing it is for the wens called *Melicerides*: wherein is engendred matter resembling honey.

CHAP. XXI.

¶ Of *Trefoile*, and *Thyme*: of the day *Lillie Hemerocallis*: of *Elcampane*, and *Southernewood*, and *Cypres*.

B I Am not ignorant that folke are verily perswaded, how that *Trefoile* or three leaued grasse, is of great force against the stings of serpents and scorpions, if either 20 graines of the seed bee inwardly taken in wine, or water and vinegre together, or if the leaues and the whole hearb be sodden, and the decoction drunk: as also, that serpents are neuer seen to lie vnder this *Trefoile*. Moreouer, I know full well that diuerse Authors renowned and of great credit, haue deliuered in their bookes, That fise and twentie graines of that *Trefoile*, which we called *Menianthes*, is sufficient for a preternatiue and antidot against all poisons whatsoeuer: besides many other medicinal vertues which be ascribed to this hearb. But for mine owne part, I am iuduced by the authoritie of the most graue and reuerend Poet *Sophocles*, to stand against their opinion; for hee affirmeth plainly, That *Trefoile* is venomous. Likewise, *Simus* the Physician doth report, that if the decoction of it sodden, or the juice thereof stamped, bee poured or dropped vpon any part of the body which is found, it wil cause the same fiery and burning smart as followeth vpon a place bitten or stung with a serpent. And therefore I would thinke with them, and giue counsell also, that it is not to be vsed otherwise than a countrepoison. For it may bee peradventure, that in this as in many other, one poyson (by a certaine antipathie and contrarietie in nature) expelleth & mortifieth another. Moreouer, this I mark and obserue in their writings, that the seed of the *Trefoile* which hath smallest leaues, if it be reduced into a liniment, is singular good to embelish womens skin, and to preferue their beauty, if the face be annointed therewith.

Thyme ought to be gathered whiles it is in the floure, and then to be dried in the shade: now there are of *Thyme* two kinds, to wit, the white, which hath a woodie root, growing vpon little hills; and this is thought to be the better: the second, is blacker, & caries besides a black floure. They are thought both of them, the one as well as the other, very good to cleare the eyesight, whether they be eaten with meats or taken as a medicine. In like maner, an electuarie or lohoch made of *Thyme*, is supposed to be excellent good for an old cough, and being taken with honey and salt, to raise and breake steam, causing the same to be raught vp with more facility: also that if it be incorporat with honey, it will not suffer the bloud to clutter and congeale within the bodie. Applied outwardly as a liniment with *Sennae*, it doth extenuate and subtiliate the rheume that hath of long time fallen in the throat and windpipe: and so also it amendeth the grievance of stomacke and belly. Howbeit, these *Thymes* must be vsed with measure and moderation: because they set the body in an heat, although they be binding and make the belly costie. Now in case there be an exulceration in the guts, there must be taken the weight of 1 denier or dram in *Thyme*, to euery Sextar of honey and vinegre: semblably, it must bee ordered in case of the pleurisie; and when there lyeth a paine between the shoulders or in the breast. A drink made of *Thyme* with honey and vinegre in manner of a juleb or syrup, cureth the griefe of the midriffe and preordiall parts neere vnto the heart. And verily a souerain potion this is to be giuen vnto them that be troubled in mind and lunaticke, as also to melancholicke persons. The same also may be giuen to those who be subject to the epilepsy or falling sicknes: whom the very perfume and smell of *Thyme* wil raise out of a fit, and fetch them again, when the disease is vpon them: it is said, that such should lie ordinarily in a soft bed of *Thyme*. This hearb is proper for those that canor draw their breath vnlesse the fit vpright, and to such as are short winded, yea, and good for women, whose monethly courses are either suppressed or come but slowly. And so that the infant were dead in the wombe, a decoction of *Thyme*, sodden in water vnto the thrids and so taken, doth send it forth of the bodie. Men also doe find a great benefit by *Thyme* if they drinke a syrup made of it with honey and vinegre, in case of ventosities and inflations: also, if their bellies be swollen or their cods; yea, and when their bladder is pained: moreouer if it

be

CHAP. XXIII.

¶ *The vertues of Oenanthe in Physicke.*

Oenanthe is an hearb growing vpon rocky and stony grounds. The leafe resembleth those of the Parnepe: roots it hath many, and those big. The stemme and leaues of this herb, if they be taken inwardly with honey and thicke sweet wine, doe cause women in labor, to haue easie deliuerance, and withall, doe cleanse them wel of the after-birth. Eaten in an Elec-tuarie, or licked in a lioch made with hony, the said leaues doe rid away the cough, and prouoke vrine. To conclude, the root also is singular for the infirmities and diseases of the bladder.

CHAP. XXV.

¶ *The medicines made with the hearbe Heliochryson.*

Heliochryson, which others name Chrysanthemon, putteth forth little branches very faire and white: the leaues are whitish too, much like vnto Abrotomum: From the tips and ends of which branches, there hang down certaine buttons (as it were) like berries round in a circle, which with the repercussion and reuerberation of the Sun-beames, doe shine againe like resplendent gold. These tufts or buttons, doe neuer fade nor wither: which is the cause that the chaplets wherewith they crowne and adorne the heads of the gods, be made thereof: a ceremonie that Ptolomæus K. of Egypt obserued most precisely. This herbe groweth in rough places among bushes and shrubs. If it be taken in wine, it prouoketh vrine, and womens fleurs. All hard tumors and inflammations it doth discusse and resolueth without suppuration. A liniment made with it & honey, is good to be applied to any place burnt or scalded. It is giuen in drinke usually for the sting of serpents: for the paines and infirmities also of the loines. If it be drunke in honyed wine, it dissolueth and consumeth the cluttered bloud, either in the belly and guts, or the bladder. The leaues taken to the weight of three Oboli in white wine, do stay the immoderate flux of the whites in women. This hearbe, if it be laid in wardrobes, keepeth apparel sweet, for it is of a pleasant odour.

CHAP. XXVI.

¶ *The vertues and properties of the Hyacinth, and Lychnis, in Physicke.*

The Hyacinth loueth France very well, and prospereth there exceedingly. The French vse therewith to die their light reds or lustie-gallant, for default of graine to color their scarlet. The root is bulbous & Onion-like, well known to these slaue-courfers, who buy them at best hand: and after, tricking, trimming, and pampering them vp for sale, make gain of them: for being reduced into a liniment, they vse it with wine to annoint as well the share of youths, as the chin and cheeks, to keep them for euer being vnder-grown, or hauing haire on their face, that they may appeare young still and smooth. It is a good defensatiue against the prick of venomous spiders: and besides, allaieth the griping torments of the belly. It forcibly prouoketh vrine. The seed of this hearbe, giuen with * Abrotomum, is a preseruatiue against the venome of serpents and scorpions: it cureth the jaundise.

As touching Lychnis, that flaming hearbe furnamed Flammea, the seed of it beaten to powder and taken in wine, is singular good against the sting of serpents, scorpions, hornets, and such like. The wild of this kind is hurtfull to the stomacke, and yet it is laxatiue and purgeth downward. Two drams thereof is a sufficient dose to purge cholles, for it worketh mightily. Such an enemy it is to scorpions, that if they doe but see it, they are taken with a nummednesse that they cannot stir. In Asia or Natolia, they call the root of this hearbe Bolites, which if it be laid vpon the eyes and kept bound thereto, taketh away the pin and the web, as they say.

CHAP. XXVII.

¶ *The medicinable vertues of Peruinele, Ruscus, Batis, and Acinos.*

Also the Peruinele, called by the Greeks * Chamædaphne, if it be stamped drie into powder, and a spoonfull thereof giuen in water to those that are full of the drop sicke, it doth euacuat most speedily, the watry humors collected in their belly, or otherwise: the same root

rested

A roasted in embres, and well sprinkled and wet with wine, discusseth and drieth vp all tumors, being applied thereto. The iuyce thereof dropped into the ears, cureth their infirmities. A cataplasme applied to the belly, helpeth them (as they say) very much, who are vexed either with gripes or fluxes of the wombe.

Concerning Ruscus, the decoction of the root, if it be giuen in drink each other day, to them that be tormented either with the stone, or the wringing paines of the strangurie, or to such as pisse bloud, it helpeth them. Now the preparing of this medicine, and the proportion also of it, is in this wise: The said root must be taken out of the ground as it might be to day, and tomorrow morning betimes it would be foddens; and a sextar of this decoction is to be mingled with two cyaths of wine, and so the Patient is to drink it. Some make no such ado, but take the root while it is green, stamp it, and in water draw the iuyce raw as it is, and so drink it. In sum, it is held for certain, That there is no better thing in the world for the infirmities and diseases incident to the priuy members of men, than to bruse the tender crops of this herbe, and then with wine and vinegre to presse out the iuyce, and afterwards to drink the same. In like maner, * Batis is good for them that be bound and costive in the belly: and a liniment of it, after it is roasted in the embres and stamped, is singular for the gout. Last of all, as touching the herbe Acinos, the Egyptians vse to sow it, as well to make guirlands thereof, as to eat it. Surely I would say it were Basil, but that the branches and leaues be more hairy; for certainly it is very odoriferous. It hath a property to prouoke vrine, and womens fleurs.

* Taken by the most part for wild B. fill:

C

CHAP. XXVIII.

¶ *The medicines that Colocasia or the Egyptian Bean doth afford.*

Colocasia was of opinion, that Colocasia was good to lenifie or mitigat the acrimony of humors within the body, and withall to help the stomack.

CHAP. XXIX.

¶ *The medicines made of Anthalium.*

Touching Anthalium (wherof the Egyptians vse much to eat) I find no other vse of it, but only from the kitchen to the table. Indeed there is an herb much like to it in name, which some call * Anthyllion, others Anticellion: whereof be two kind; the one hath leaues and branches like to the Lentill, and groweth a hand breadth or span high: it commeth vp in sandy grounds exposed to the Sun, and is saltish in taste. The other resembles * Chamæpitys but that it is lower and more hairy: it beareth a purple floure, carrieth a strong sent, and loueth to grow in stony places. The former kind is a most conuenient and proper herb for the diseases of the matrice and the natural parts of women. Also being applied as a cataplasme with oyle Rosat and milke, it is an vmbretarie medicine. In case of the strangury and pains of the kidnies it is giuen with good successe to the quantitie of three drams. The other likewise is giuen to drink the weight of four drams with hony and vinegre, for to mollifie the hardnesse of the matrice, to assuage the torments of the belly, and to cure those that be taken with the falling sicknesse.

* Some take it for Kalli.
* Anthyllion.
* Chamæpitys.
* Diofco.
* Some white brackish.
* Ina muscata.
or Arabitica.

CHAP. XXX.

¶ *Of * Parthenium, and the medicinable vertues that it hath.*

As for Parthenium, some name it Leucanthe, others Tamnaum; but our countryman Celsus the Physitian calleth it Perdicium and Muralium. It groweth in the mounds & hedges about gardens: it bringeth forth a white floure, sauouring like an * apple, and hauing a bitter taste. The decoction of this herbe, if a woman sit ouer it and receiue the fume into her body, is good to mollifie the hard tumors of the matrice and natural parts; as also to discusse all inflammations. A powder made of this herb dried, and incorporat with honey and vinegre, [i. Oxymel] and so applied, purgeth cholera adust and melancholy. In which regard it is good for the swimming and dizziness of the brain, and those that are giuen to breed the stone. Being vsed in maner of a liniment, it is good for the shingles and S. Antonies fire: likewise for the Kings euil, if it be incorporate with old swines greafe. The Magicians vse it much for Tertian

* Some thinke it is Mother-wort, others Feuefew.

* Specially according to Diofcorid. & Plinie should haue written thus: Flore per ambrosium candido, id est, with a floure white round about but within of a dark yellow like to honey: & this is good to Feuefew.

agues: but they lay a great charge, that it should in any wife be plucked vp with the left hand, and the parties precisely named for whose sake they gather it: but in any case they who pluck it, must not look behind them: which done, a leafe of the herbe must be put vnder the tongue of the sick patient; and when it hath bin held so a little while, it must anon be swallowed down in a cyath of water.

CHAP. XXXI.

¶ Of Night-shade or Morell: of *Alkakengi* and *Halicacabus*, and their vse in Physicke.

* *Alkakengi*, or winter-cherry
* or rather for that the sayd berry lieth within a cod like a bladder.

NOW concerning Nightshade or Morell, which some name *Strychnos*, others haue written by the name of *Trychnos*; would to God that the guirland-makers of Egypt had not employed and vsed in their chaplets the floures of two kinds of them, induced therto by the resemblance that they haue to the Iuy floures: of which, the second that hath red berries like cherries of a scarlet colour, contained within certain bladders, & those berries full of grains or seeds, some name * *Halicacabus*, others *Callion*: but our countrey men here in Italy call it * *Vesicaria*, because it is good for the stone in the bladder. Certes this plant is more like a shrub, or little tree full of branches, than any herb, bearing great and large bladders, & those fashioned like a top, broad and flat at one end, and sharp pointed at another, inclosing within it a great berry, which ripeneth in the month Nouember. The third kind of *Strychnos* or *Solanum* hath leaues like to Basil: but I must but lightly touch this herb, and not stand long about the description either of it or the properties which it hath; since my purpose is to treat of hollosom remedies to saue folke, and not of deadly poisons to kill them: for certes this herb is so dangerous, that a very little of the iuice thereof is enough to trouble a mans brain, and put him beside his right wits. And yet the Greeke writers haue made good sport with this herb, and reported pretty jcasts of it: For, say they, whoeuer taketh a dram of the iuice shall haue many strange fantasies appearing euidently vnto them in their dreames; if they be men, that they dally with faire women: if they be women, that they be wantons, playing and toying with men without all shame and modesty; and a thousand such vain illusions: but in case they take this dose double, then they shall proue foolish indeed broad waking, yea & go besides themselves: let them take neuer so little more, it is mortal, and no remedy then but death. This is that poison which the most harmlesse and best minded writers that euer wrot, called simply *Dorycnion*; for that soldiers going to battell vsed to anoint and inuenom therewith the heads of their arrows, darts, and speares, growing as it did so commonly in euery place. But other Writers, who had not fought so far into the matter, nor aduisedly considered of it, gaue it the name of *Manicon*. But those that of a naughty mind, cared not secretly to impoison the whole world, haue hidden the danger thereof, and term it by a name pretending no harm; some calling it *Neuris*, others *Perisson*. But as I protested before, I think it not good to be too curious and busie about the description of this herb, notwithstanding I might seem to giue a good caueat of it by further particularizing thereof. Well, the very second kind which they call *Halicacabus*, is bad enough, for it is more soporiferous than Opium, and sooner casteth a man into a dead sleep, that he shal neuer rise again. Some name it *Morion*, others *Moly*: and yet it hath nor wanted those that haue thought it praise-worthy: for *Diocles* and *Euenor* haue highly commended it: and *Tamaristius* verily hath not stuck to write verses in the commendation of it: A wonderful thing, that men should so far ouerpasse themselves, and forget all honesty and plaine dealing: for they say, forsooth, that a collution made of this herbe confirmeth the teeth that be loose in the head, if the mouth be washed therewith. And one onely fault they found in *Halicacabus* (otherwise it might be praised without exception) that if the said collution were long continued, it would trouble the brain, & bring them that vsed it to foolerie & idleness of head. But for mine own part, my meaning is not to set down any such receipts and remedies, which may bring a further danger with them, than the very disease it selfe for which they were deuised. The third kind also is commended for to be eaten as meate, although the garden Morell is preferred before it in pleasantness of taste. Moreover, *Nemocrates* auoucheth, That there is no maladie incident to our bodies, but the said Morell is good for it. Howbeit, I make not so great reckoning and account of all the hopes that these and such like herbes may afford, as I doe make confidence

to

A to deliuer them in writing, especially seeing we haue so great store of safe and harmlesse medicines, which we may be sure can do no hurt. Indeed, the root of *Halicacabus* they vse to drinke and make no bones at it, who would be known for great Prophets to foretell future things: and therefore it is alone for them to be seen furious and raging, the better to colour their knauerie and lead the world by the nose in a superstitious conceit and persuation of their diuine gift of prophesie, and so to feed men still in their folly. But what is the remedie when a man is thus ouertaken? (for surely I am better content to deliuer that) Euen to giue the party thus intoxicate, a great quantity of Meade or honied water, and to cause him to drinke it off as hot as he can. Neither will I ouerpasse this one thing besides, That *Halicacabus* is so aduerser vnto the nature of the Aspis, that if the root thereof be held any thing neere vnto the said serpent, it will bring B asleepe and mortifie that venomous creature, which by a soporiferous power that it hath also of the own, casteth a man into a deadly sleep, and killeth him therewith. And therefore to conclude, hereupon it commeth, that the same root bruised and applied with oile, is a soueraigne and present remedie to them who are stung by the foresaid Aspis.

CHAP. XXXII.

¶ Of *Corchorum* and *Cnicus*.

C THEY of Alexandria in Egypt vse to eat ordinarily of *Corchorum*. This herb hath leaues inwrapped and infolded one within another, after the maner of the Mulberry. Good it is (as they say) for the midriffe and the parts about the heart: also to recouer haire that is fallen away by some infirmitie; and likewise for the red pimples or sauce-flegme in the face. I reade moreover, that the skab or mange in kine and oxen is most speedily cured thereby. And *Nicander* verily doth report, that it helpeth the stinging of serpents, if it be vsed before it be in the floure. As touching *Cnicus*, otherwise called *Atractylis* (an herb appropriate to the land of Egypt) I would thinke it meet not to vse many words about it, but that it yeeldeth a soueraigne remedie against the poison of venomous beasts; yea, and the dangerous Mushrooms if a man haue eaten them. This is certain, and an approued experiment, That whoeuer are wounded by the sting of Scorpions, shall neuer feeble smart or paine, so long as they hold that herb in their hand.

CHAP. XXXIII.

¶ Of *Perfoluta*.

T HE Chaplet-makers in Egypt set great store by *Perfoluta* also, which they sow and plant in their gardens onely for to make Coronets and Guirlands. Two kindes there be of it, the male and the female. It is said, That the one as well as the other, if it bee put vnder man or woman in bed, they shal haue no minde nor power at all to play at *Venus* game, and specially the man.

CHAP. XXXIV.

¶ Of Measures and Weights.

E AND so far as much as we shall haue occasion oftentimes in setting downe weights and measures, to vse Greeke vocables, I care not much euen in this place to interpret those words once for all. First and foremost, the Atticke Drachma [for all Physitians in manner go by the poise of Athens] doth peise iust a Roman silver denier: and the same weigheth also six Oboli: now one Obolus is as much in weight as ten Chalci. A Cyathus of it selfe alone cometh to ten drams in weight. When you shal reade the measure of *Acetabulum*, take it for the fourth part of Hemina, that is to say, fifteen drams. To conclude, Mna, which we in Latine call Mina, amounteth iust to an hundred drams Atticke.

THE TWENTY SECOND BOOK OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS

SECVNDVS.

The Proeme.

Man would thinke who did but reade the former Booke, That dame Nature and the Earth both had done their parts, and shewed their wonderfull perfection sufficiently; if he considered with all the admirable vertues of so many herbes which they haue brought forth and bestowed vpon mankind, as well for pleasure as profit. But see what a deale of riches more is yet behind, and how the same, as it is harder to be found, so it is in effect more miraculous! As for those Simples whereof wee haue already written, for the most part they are such as haue serued our turne at the board: or else in regard of their beauty, odor, and smell, haue endued vs to search further into them, and to make triall of their manifold vertues and operations in Physick. But yet there remain behind many more, and those so powerfull, that they proue incidently vnto vs, how Nature hath produced nothing in vaine and without some cause: although the same be occult and hidden many times from vs, and reserved only in her closet and secret counsell.

CHAP. I.

¶ Of certaine Nations which vse herbes for procuring and preserving of beauty.

Eertes I do find and obserue, that there be forrein Nations who time out of mind haue been euer accustomed to annoint their bodies with the iuice of certain herbes, for to imbellish and beautifie them, as they thought. And verily in some of these * barbarous countries ye shall haue the women paint their faces, some with this herbe, and others with that: yea and among the Dakes and Sarmatians, in Transyluania, Valachia, Tartaria, & those parts, the men also marke their bodies with certain characters. But to goe no farther than into Gaule, there groweth an herb there like vnto Plantain, and they call it Glastrum, [i. Woad] with the iuice whereof the women of Britain, as well the married wiues, as yong maidens their daughters, anoint and dy their bodies all ouer, resembling by that tincture the color of Moores and Ethiopians: in which manner they vse at some solemne feasts and sacrifices to go all naked.

CHAP. II.

¶ That Clothes be died with certaine Herbs.

AND now of late dayes, we know there hath been taken vp a strange and wonderfull manner of dying and colouring clothes. For (to say nothing of the gown brought out of Galatia, Africke, and Portugal, whereof is made the royall Skarlet, reserved for princes only and great captains to weare in their rich mantles of estate and coats of armes:) behold, the French inhabiting beyond the Alps, haue inuented the means to counterfeit the Purple of Tyrus, the Skar-

- A Skarlet also and Violet in graine, yea, and to set all other colours that can bee deuised, with the iuice only of certain hearbs. These men are wiser (beleeue mee) than their neighbours of other nations before them: they hazard not themselves to sound and search into the bottome of the deepe sea for Burrets, Purples, and such shell-fishes. These aduerture not their liues in strange coasts and blind baies, where neuer ship hath rid at anker, offering their bodies as a prey to feede the monstrous Whales of the sea, while they seeke to beguile them of their food in fishing for the said Burrets: & all to feed that, whereby as well vnehaist dames of light behauiour might set out themselves and seeme more proper, to allure and content adulterous ruffians: as also those gallants again, squaring and ruffing thus in their colours, might court faire ladies and wedded wiues, yea, and with more ease entrap and encompasse them to yeeld to their pleasure: but these men stand safe vpon drie land, and gather those hearbs for to die such colors, as an honest minded person hath no cause to blame, nor the world reason to crie out vpon. Nay our braue minions and riotous wantons, it might beseeeme also to be furnished therewith, if not altogether so glorious to the eye, yet certainly with lesse offence and harm. But no part it is of my desseigne and intent to discourse vpon these matters at this present: neither will I stand on the thrift and good husbandry that may be seen in such a thing as this, least I might seeme to colour any vanitie with a shew of commodity and frugality: and to limit excesse and superfluitie within the tearms of profit and cheapnesse, which indeed will not be gaged and brought within any compasse. Besides, I shall haue occasion hereafter in some other place to make mention both of dying stones, and also of painting walls with herbes. As for the art and mysterie of Diers, if euer it had been counted any of the liberal Sciences, beseeeming a gentleman either to professe or practise, I assure you I would not haue ouerpassed it in silence. And yet I promise you, this feat grows to credit euery day more than other: and the * hauens abroad where those fishes be taken which furnish them with colors, are mightily frequented and in greater name and request than euer they were. In which regard, I cannot chuse but shew and declare what account we ought to make of these dumbe tinctures in that behalfe; I meane such hearbs and simples, whereof there is but base reckoning or none at all made: for those great princes which were the first founders and establishers of the Roman Empire, did mighty things therewith, and employed these herbes in the highest matters of state. For in the affaires of greatest importance, namely, either in publick sacrifice for the auerting of some heavy judgement of the gods threatened: or in expiation of any gricuous sinne and offence committed (whether they performed diuine seruice to their gods, or dispatched honourable embassages to other States) they vsed their Sagmina and Verbenæ, by which two words verily was meant one and the same thing, euen some plain and common grasse plucked vp with ceremoniall deuotion, turfe and all, from their castle hill or citadel of Rome. And this at all times was observed religiously, that they neuer sent their heralds to the enemies of the people of Rome for to clarigat, that is to say, to summeone them with a loud voice for to make restitution of that which they deteined of theirs, without a turfe and tuft of the said grasse: and euermore there accompanied these heralds in their train, one speciall officer who had the charge to carie and tender that hearbe, who thereupon was called Verbenarius.

CHAP. III.

¶ Of grasse Chaplets.

- N O Coronets verily were there euer at Rome better esteemed, either to testifie the triumphant majestie of that victorious citie (the soueraign lady of the whole world) or to giue testimony of honour and reward for some notable seruice performed for the Commonweale, than those which were made simply of green grasse. The crownes of beaten gold, and enriched with pearle, the Vallare and Murall Chaplets bestowed vpon braue knights and valiant souldiers, who either entred the fortified camp of the enemy ouer trench & rampier, or mounted the wals in the assault of a city, came nothing neer to this: the Nauall garlands giuen to admirals and generals at sea, for obtaining victory in that kind of seruice: the ciuick coronets also presented vnto such as had rescued a Romane citizen, and saued his life, came behind these: and in one word, the Chaplet triumphat, which they ware who entred with triumph into Rome, was nothing comparable to these. And yet all these Guirlands abouenamed haue notable prerogatiues, and differ one from another in many respects. In a word, those Coronets and Chaplets of honour

* Portibus au-
gentur an-
tibus.

* All such as be
neither within
Greece nor
Italic.

M

honor, all saue these made of grasse, were giuen many times by some priuat and particular persons, are by the captains and generals themselves vnto their soldiery; yea, and otherwhiles from one Generall to another, when they were ioined together in equall commission, in testimony of vertue and valour.

CHAP. III.

¶ *The singularitie and rare examples of such Chaplets made of grasse.*

NOW, whereas other Garlands of honour and Coronets of triumph, were alwaies either ordained by a decree from the Senat in time of peace, and after the troubles of warre ouerblowne; or granted by an act of the people, being quiet and in repose, when dangers were past; this Chaplet of grasse afore said, it was neuer any mans hap to haue, but in some extremity and desperat case of the whole state: nor at any time adiudged to a man, but by the whole army, confessing with one voice and generall consent, That by him alone they were all saued from the edge of the sword, or famine. As for the rest, the capitaines and generals vsed to giue them: this onely was presented by the souldiers to their chiefe leader. The same was called also an Obditionall coronet or siege-garland; namely, when some capitaine had forced the enemies to raise the siege and dislodge, and thereby saued either a whole towne or campe from vter shame and finall destruction. And Certes, if there were to great account made of a ciuicke garland for rescuing the life of one only citizen of Rome (and such an one perchance as was of all others the meanest) that whose fortune it was to obtain it, he was honored euer after with many priuiledges and immunities, and counted sacred: how highly then is he to be esteemed, who by his own valour and proesse hath saued many thousands, and a whole army of such citizens? This Chaplet then, so singular and excellent, was made of the green grasse, or herbes taken and gathered from the very place where a man had saued & deliuered the besieged. For in truth, the greatest signe of victory in old time, and of yielding to the mercy of the enemy, was this. If the vanquished did take vp grasse, and tender it vnto the conqueror: for this serued as a confession and protestation, That they rendered vp all their interest which they might challenge in the earth (the mother that bred and fed them) yea, and the very right of sepulture in her: which custome I vnderstand, the Germans do retaine and obserue, euen at this day.

CHAP. V.

¶ *What capitaines they were, who alone received the honor of a grasse Chaplet.*

LVCIUS SICIUS surnamed *Dentatus*, was crowned but once with this Coronet of grasse: notwithstanding it was his good fortune to deserue and obtaine foureteene Ciuick garlands: to fight with his enemy in a hundred and twenty battels, and euer to return out of the field with victory: whereby we may see how rare a thing it was in times past, to see an army thus saued through the valour of their capitaine, for to recognize by this publick present their only fauor. And some leaders and captains haue bin honoured this way oftener than so: as for example, *P. Decius Mus* receiued two such Coronets: for being a Colonell and knight Marshal of the camp, he behaued himselfe so valiantly, that one was giuen him by the regiment or army which himselfe led; and another by those who had bin besieged within their fort. And how highly he esteemed of this honourable reward, hee testified by his religious deuotion and the sacrifices which he offered thereupon to the gods: for no sooner had hee receiued these Coronets; but whereas the armie afore said besieged, and by him deliuered, had bestowed vpon him ouer and aboue for his braue seruice, one white Oxe, and an hundred others, which were brended, hee sacrificed them all vnto god *Mars*. This was that *P. Decius*, who afterwards being Consull together with that surly and imperious colleague of his [*T. Manlius*] surnamed *Imperiosus*, deuoted and yielded himselfe to all the diuels of hell for the safety of his armie, and the obtaining of victory. Moreover, that noble and renowned *Fabius*, who set vp right again the declining state of the Romane Commonweale, with lying off and not fighting at all with *Annibal*, was crowned therefore with such a chaplet, by authority from the Senat and people of Rome: such an honor in my judgement as no man in this world can reach and attain to higher. True it is, that before time he had performed good seruice, & namely, when being Dictator, he rescued & saued his

A his high^{*} Constable or grand master of the Cauallery, together with his whole army: and yet was he not thus highly rewarded then, with this Coronet of green grasse. For in testimony of thankfulness, this gratuity they whom hee had saued, thought at that time better, namely, to crowne him (as it were) with a new name & title to his former stile, calling him with one voice, Father: but the honor aboue named was giuen vnto him (as I said) by the generall consent as well of Senat as people, at what time as he chased *Annibal* out of Italy. And in truth, neuer man yet was in this wise knowne to be crowned by the hands (if I may so say) of the whole Empire, but himselfe alone. This peculiar honor obtained he aboue all others, that this Chaplet alone was offered and presented vnto him by all the states of Italy.

CHAP. VI.

¶ *What he was, who alone of all Centurions received this Chaplet of grasse.*

BESIDES those abouenamed, I find that *M. Calpurnius Flammia*, a Colonell of a regiment of souldiers in Sicily, was in this manner rewarded and honored with a grasse garland. But neuer was there known to this day any one to haue bin crowned in this wise, of so base degree and condition as *C. Perreus Attius*, in that war wherein the Cimbrians were defeated, who indeed was no better than a simple Centurion. This Centurion hauing by his place the conduct of the formost band of a regiment of souldiers vnder Colonell *Catulus*, seeing vpon a time certain companies excluded out of their owne campe, by reason that the enemies had put themselves between them and home, and there incamped; perceiving his capitaine or Colonell *Catulus* afore said, timorous and doubtfull to breake through the enemies camp; put on a resolute mind, slew his own Colonell, exhorted and encouraged the companies to quit themselves like men, and follow his ensigne; and so he defeated his enemies and deliuered his own legion. I reade moreover in the Chronicles, That the same Centurion ouer and aboue the foresaid braue ornament of a grasse Coronet, had this honor done vnto him, that being clad in a long robe of purple imbrodered, and assisted with both the Consuls for the time being, *Marius* and *Catulus*, he was allowed to sacrifice vnto the gods with a noise of fifes and haut-boies sounding hard by the hearth or altar fire. Furthermore, *Sylla* the Dictator hath left in writing, That when he was lieutenant Generall vnder the Consuls, and had the leading of the army in the expedition or journey against the Marsians, the whole army presented vnto him a Chaplet of grasse, before the city of Nola. And in very truth hee caused this to be pourtrayed in a painted table within a house of pleasure which he had in Thufculum, the same that afterwards *M. Tullius Cicero* was master of. Which if it were true, the more shame deserued he in my conceit: and I hold and pronounce him so much the more accursed and detestable, for taking this crowne from his own head, and losing such a braue badge of honor, in proscribing, ouerthrowing, banishing, and murdering afterwards, a greater number of citizens (without all comparison) than those souldiers came to, whose liues he saued, at what time as he took that garland first vpon his head. Let him vaunt as much as he wil of the said Coronet, as also of the proud and vain glorious title of *Felix*, happy (which addition or surname he took vpon him & caused to be put into his stile) yet, when as through his tyranny he held besieged those Roman citizens whom he had proscribed and confined into all parts of the world, surely he forewent all and yielded that crowne vnto *Sertorius*. Moreover, *M. Varro* doth report, That *Scipio* surnamed *Emilianus*, was honoured with an Obditionall Coronet in Africk (the same yere when as *Manlius* was Consull) for sauing three cohorts besieged; as also three companies besides which he led forth to deliuer the other, and by whose means he forced the enemy to break vp his siege. This is to be seen and read in a Table, which *Augustus Caesar* late Emperor of famous memory, caused to be hanged vp at the base or foot of the said *Scipios* statue erected in the Forum or publick hall which himselfe built. As for *Augustus* himselfe, the Senate crowned him with an Obditionall Chaplet, vpon the thirtieth day of September, that yere when he was Consull with *M. Cicero*, the son of that great *Cicero* the Orator. Whereby we may see, that a Ciuick Chaplet was not thought sufficient nor anywaies comparable to this Coronet. And setting aside these aboue named, I do not find in histories, of any one who was crowned with a green chaplet of grasse. Now, this you must note withall, That there was not one certaine herbe set out & appointed for these honorable Guirlands; but look what kind of herbage grew then in the place besieged & where the danger was, that

that very fame they tooke, were they neuer so base weeds and of no reckoning: for as contemptible otherwise as they were, yet being once imploied to this vse, they innobled & adorned the person himselfe who ware them in a Chaplet. And certes, the lesse maruel I haue if these things be vnknowne to vs now adaies, seeing as I doe, how little or no account is made euen of those things which make to the maintenance and preseruatiō of our health; to the cure of all dolorous griefes and maladies of the body, yea, and to the preuention of death it self. But what man is there well giuen and honestly minded, who can containe and hold his peace, hauing so iust cause to reproue and rebuke the manner of the world in these our daies: first and foremost, our life was neuer so costly as now it is, in regard of the dainties, delights, and superfluities, which must be maintained, if will liue to the fashion of the time: and for to ioy these pleasures onely, we hold our liues more sweet and precious. Neuer were men more desirous of long life, and neuer lesse carefull to entertaine the means of long life. The gouernment of our health we commit to the charge of others, and strangers we credit with our owne bodies, and yet slacke enough and negligent are they, to ordain according to our trust and confidence, that which indeed should do vs good. Thus the Physitians are prouided well for; they thrive alone and go away with the gains by this means. Oh good God, to see the folly and vanity of man! Nature hauing put so many good things into our own hands as she hath, and willing that we should inioy them for our health and pleasure: yet we (to our great shame and rebuke be it spoken) are so vnhappy, as to commit our felues to other mens tuition, & liue vnder their warrantize and assurance. Full well I know, that I for my part also, shall haue but small thanks of many a one for all my paynes taken in writing this history of the world and Natures works: nay, I am assured that I make my selfe a laughing stocke, and am condemned of them for spending and losing my time in such a frivolous piece of worke as this is. Howbeit, this is yet my comfort and no small contentment I take herein, that my labors and trauels (excessiue and infinit though they be) cannot be despised, but the contempt will redound likewise to dame Nature her selfe. And yet she againe, as a kind and tender nurse ouer mankind, hath not failed (as I wil declare hereafter) for our good, to indue the very weeds which we tread vnder foot with medicinall vertues, yea, & hath bestowed vpon those which otherwise we hate & dare not approach, but with careful heed (for the shrewd pricks and thorns which they carry about them) singular properties to cure diseases. For ouer and besides those wherof I made mention in the booke going next before this, there be other herbs of that pricking kinde, which are so wonderfull in their operation and effects, that I can neuer admire sufficiently and comprehend her prouidence appearing in them. Furnished shee had the earth, with smooth & pricklesse plants enough, in the nature of meates, for to content our tooth, & satisfie our appetite, she had ingrauen and liuely painted in floures, notable properties in physick for to recouer & maintain our health; & by the singular beauty which she gaue vnto them, to allure the heart and eye of man to look toward them, saying (as it were) Come and gather vs: wherein she had made a good medley of profit and pleasure together. And when she had thus done, she staid not there, but deuised to bring other herbs, hideous to the eye, and vnttractable in hand. As if in the forming of them in that fashion, wee might heare her to giue a reason, Why shee sodid: saying after a sort vnto vs in an audible voice, That shee made them with pricks and thornes, because shee would not haue the foure footed beasts (as hungry and greedy after meate as they be) to eat them down, That the shrewd hands of some vngracious folk, who can let nothing stand, might not be euer & anon plucking and twitching at them for wantonnesse, that people should not go carelessly trampling vpon them with their feet: finally, for feare that birds pecking & feling aloft vpon their tender branches would flie them down or knap them asunder. Therefore (I say) with these prickles, seruing in stead of weapons as wel defensiu as offensiu, shee hath both protected and also armed them: and al to keep them safe and sure, for the health of man, and to do him seruice. Lo, how euen that which wee hate and seeme to abhorre in these herbs, was deuised for our comfort and benefit, if we had the grace to see it.

CHAP. VII.

¶ The medicinable vertues of other floures and herbs seruing for Chaplets. Also of Erynge.

* Sea holly.

A MONG those hearbes which beare pricks, * Erynge or Eryngion, is singular: for a soueraigne hearbe it is against serpents, and all poysons whatsoeuer, as if it grew for nothing els. But to come

A come to particulars, for stings & bitings of venomous creatures, the roote therof to the quantity of one dram, is taken in wine. And in case (as most times it falleth out) that a feuer follow vpon such accidents, then the patient must drinke it with water. A speciall and effectfull property it hath against certain land-snakes called Chersydri, and venomous todes, if it be reduced into a liniment, and so applied to the sore. But *Heraclides* the Physitian is of opinion, That if the said roote be boiled in the broth of a goose, it is of more efficacie than all other, against the Toxica and Aconita. But whereas others do boile it in sheere water against the poisons Toxica, *Appolodorus* would haue a frog sodden withal. The herb it selfe is of substance hard, branching much, full of leaues, and those beset with prickles. A stem or stalk it carieth, parted by knots and joints, a cubit high & somewhat more. Moreover, as there is white Erynge, so you shal haue of it blacke: B The roote is odoriferous. Eryngion verily commeth vpon ordinarily of seeds and by setting. But it groweth also in rough and stony places of the own accord. And that which we see along the sea shore is harder and blacker than the rest, leaued also like common Ach or Persely.

CHAP. VIII.

¶ Of the hearbe or thistle commonly called Centum-Capita, i. the hundred heads.

A S for the white Erynge, our countrymen call it in Latine Centum-capita. But they be all of one and the same operation and effect. And the Greeks verily make their ordinary meat as well of their stalks as roots, both waies, to wit, either raw or boiled, as they list. Certes, there be wonders reported of this herb; namely, That the roote of this white Eryngion (which is very eason and hard to be found) resembleth one while the male sexe, and otherwhiles the female of our kind. But if it chance that a man do meet with that Eryngion which is like to that member which distinguisheth him from a woman, he shall be very amiable and beloued of women. Which was the reason (men say) that lady *Sappho* was so enamoured on the yong knight *Phao* of Lesbos. And verily, as touching this herb, not only the Magitians, but the disciples also and followers of *Pythagoras*, tell vs many vain and foolish tales. But to come indeed to the vse of it in Physick. Ouer and besides those vertues and properties which I haue related already, good it is to resolute ventosities: it easeth the gripes and wrings in the belly; it cureth the diseases and debility of the heart; it helpeth the stomach and liuer. For the midriffe and precordial parts, it is very wholsome taken in honied water: and for the spleen, in vinegar & water together. Also drunk in mead or honied water aforesaid, it is singular for the kidneies, the strangury, the cramp or crick that pulleth the head of a body backward: for other spasmes also and convulsions: for the loines, the dropsie, and the falling sicknesse. Soueraigne it is moreover for womens monthly fleures, whether they do stay vpon them, or contrariwise run excessiue from them: and in one word, it cureth all the accidents & infirmities of the matrice. Being applied as a liniment with hony, it draweth forth any offensive thing sticking within the body. And if it be laid too with salt, lard, or hogs grease, and so incorporat into a cerot, it heales the kings euill, the swelling kernels within the eares, and the flat biles and botches. It reioineth also the flesh that is gone from the bone, & finally, souldereth and knitteth broken bones or fractures. Taken before a man sit downe to eat or drink, it preserueth him from surfet or drunkennesse: and bindeth the belly. Some of our Latine writers would haue it to be gathered a little before the summer-solstice, saying moreover, That if it be applied with rain water, it helpeth all the infirmities incident to the nape of the neck; and by their report, if it be bound to the eyes, it cureth the pin and the web.

CHAP. IX.

¶ Of *Acanus* and *Liquorice*.

SOME there be who take *Acanus* for a kind of Eryngium. And they describe it to be a low herbe, and yet growing broad and large, full of prickles and thornes, and those likewise bigger than ordinary; being applied outwardly, wonderfull effectfull: it is (by their saying) to stanch blood. Others there are, who haue thought Erynge and Liquorice to be all one, but they are deceived. Howbeit, for some resemblance that is between them, I think it not amisse to set down the description therof immediately after these Erynges. Doubtlesse this Liquorice also is

* *Echinatis*. It seemeth that *Phily* neuer saw *Liquorice*, but read *in* for *phily*, *Lentis*: & indeed the leaues are like to those of the *Lentiske* tree.

* *In lingue sub-* *dis*: such as be of the *Ecligmata* or *Lochs*.

to be counted among these thorny plants, for that the leaues stand *pricking vp sharp pointed; the same are fatty, and in handling gummy and glewie. It putteth forth many branches, and those two cubits high: it carrieth a floure in manner of the Hyacinth, and beareth fruit resembling bals of the bignesse of those which hang vpon the Plane tree. The excellent *Liquorice* is that which groweth in Cilicia; the next for goodnesse commeth from Pontus: and hath a sweet root which only is vsed in Physick. Taken vp this is and gathered at the setting or occultation of the Brood-hen star, and is found running along in the ground in manner of the Vine root: in colour like to the Box tree. That which is dusky and somewhat black, is thought to be the better: like as the lithe & pliable root which wil wind and turn euery way, is preferred before that which is brittle and easie to break. Great vse there is of it in those medicines which be *held vnder the tongue, so to resolue & melt leafully, namely, after it hath bin sodden to the thirds: yea, and otherwhiles boiled to the height and consistence of hony. Sometimes they vse to bruse it, and in that manner they do lay it vpon wounds, where it doth much good: as also if it be applied to all the diseases and accidents befalling to the throat and iawes. The juice of *Liquorice* reduced to a thick consistence, if it be put vnder the tongue, is singular for to cleare the voice. In like manner it is supposed very wholesome for the brest and liuer. And therewith (as I haue sayd before) both thirst and hunger may be slaked and allaid. Which is the cause that some haue called it *Adipon*: and in that regard ministred it to those persons who be fallen into a dropsie, for to preuent and take away their thirstinesse. Therefore it is thought to be a proper remedy for the diseases of the mouth, if it be either chewed, or otherwise cast and strewed vpon the vlcers therein: and so it cureth the excrescences also and exulcerations about the roots of the nailes. Moreover, it healeth the excoriation & sorenesse of the bladder, assuageth the paine of the kidneies, cureth the swelling & aking piles, the fissures also in the seat, and finally the vlcers of the priuy parts. Some Physicians haue prescribed to drink in a quartaine ague, the weight of two drams of *Liquorice*, & one of *Pepper*, in a draught of water to the quantity of a smal pint or hemina: this root being chewed, staith bleeding in a wound. To conclude, some haue written that it expelleth the stone and grauell.

CHAP. X.

¶ Of the *Caltrop* thistle *Tribulus*. The sundry kinds thereof, and the medicines which they yeeld.

Some of these Thistles come vp in gardens: others grow in and about riuers only. The juice which is drawne from these, is thought to be good for the eyes: for this herb being as it is of a cooling nature, is a singular remedy for inflammations and gathering of imposthumes. A good medicine for all vlcers, but those especially which break out of themselves in the mouth: it cureth likewise those of the Amygdales or almonds of either side of the throat. If it be taken in drink, it fretteth & breaketh the stone. The Thracians dwelling vpon the riuer *Strymon*, feed their horses fat with the leaues of this herb: and liue themselves with the kernels or fruit thereof, making a kind of sweet bread therewith, which also bindeth the belly. The root if it be gathered by the chaste and pure hands of a virgin discusseth and dissolueth the kings euill. The seed if it be tied to the swelling vains, assuageth their pain. Lastly, being beaten into powder and cast into water, it killeth the fleas in any place where that water is thrown or sprinkled.

CHAP. XI.

¶ Of *Stabe*, and the medicines which it affordeth.

* A kinde of *Marfellon* or *Knapweed*.

Stoebe, * which some call *Phleon*, boiled in wine, is a foueraigne remedy for cares that run with atter: likewise for bloudthorten eyes, especially vpon a stripe or stroke giuen. Being ministred by way of clyster, it is good for the bloudy flux and the exulceration of the guts.

CHAP. XII.

¶ Of *Hippophyes* and *Hippope*, with their medicinable vertues.

Hippophyes is an hearbe growing in grauelly and sandy places, and namely along the seaside, armed with white prickles or thornes: it beareth berries by clusters after the manner of

A of *Iuice*, and those be partly white & partly red. The root is ful of a certain juice, which is good either to be condite and confectioned alone, or els to be reduced into Trofchs with *Eruile* meale: this being taken to the weight of one *Obolus*, purgeth cholericke humors; and a most wholesome medicine it is, especially with honied wine.

Another herb ther is, named *Hippope*, which neither riseth vp in stalk, nor beareth floure, but hath leaues only, and those small. The juice also of this herb, is wonderfull good for those who are in a dropsie. Where it is to be noted, That these two herbs should haue some especiall properties respectiue to the nature of horses, considering both their names are deriued from nothing else; for in very truth, some things there be which Nature hath brought forth as appropriate remedies for certain particular beasts, whereby we may see her diuine power, and how well appointed she is and provided for to bring forth medicines of all sorts; so as the depth of her providence cannot be founded, neither are we able sufficiently to admire her wit and description in disposing and digesting her remedies according to sundry kinds of creatures, according to diuers causes, and different seasons: insomuch as the remedies seruing one, are not fitted for another, neither are they of the same effect and operation at all times: nay, there is not a day almost in the yere throughout, but it yeideth a remedy respectiue vnto it.

CHAP. XIII.

¶ Of the *Nettle*, and the medicinable vertues thereof.

C S there any thing more hated and odious than the *Nettle*? and yet to say nothing of the oile made of it in Egypt (according as we haue shewed heretofore) indued therewith is and furnished with many good properties seruing for Physick. For first, as touching *Nettle* seed, *Nicander* affirms, That it is a very counterpoison against *Hemlock*, venomous musthrums, and *Quicksilver*. *Apollodorus* addeth moreover, and saith, That being boiled in the broth of a *Tortoise*, it is singular good for the poison of *Salamanders*: also that it is contrary to the pernicious nature of *Henbane*, and the deadly poyson of serpents, & namely, of scorpions. Euen that very bitterness and mordacity which the *Nettle* hath, causeth the *Vula* in the mouth which is false, to knit vp againe: the matrice also which is ouer-loose and beareth downe, to arise into the place, yea and the tuill or fundament in children hanging forth of the body, to return & abide where it ought to be, only with touching these parts therewith. If the legs be rubbed, and the forehead especially with *Nettles*, it is a good meanes to awake them out of their drowlie and dead sleep, who are surprised with a lethargy. The same being applied with salt, is passing good for the biting of dogs. If it be bruised and put vp to the nostrills, it stancheth bleeding at the nose; but principally the root of it. If it be tempered with salt, it mundifieth cancerous and foule filthie vlcers; likewise it helpeth dislocations and bones out of joint; it discusseth or ripeneth botches in the emunctories, and the swelling kernels behind the eares; and healeth vp the places where the fleshy parts be gon from the bones. *Nettle* seed taken in wine cuit (as a drinke) openeth the matrice when it is ready to strangle or suffocate a woman: and being applied with wine, it staith bleeding at the nose. If one drinke *Nettle* seed after supper, with hony and water, to the quantiv of two oboles weight, it openeth the passages & maketh way for to vomit with greater facility: but the weight of one *Obolus* taken in wine, refresheth those who haue a lassitude or wearinesse vpon them. The same being parched against the fire and drunk to the measure of one *Acetabulum*, is singular for the imperfections of the matrice: and in cuit, it withstandeth the ventosities and inflations of the stomack. Giuen inwardly with hony in the form of a loch, it doth them good who labor for wind, and cannot take their breath but sitting vpright; and after the same manner it cutteth scame and clenseth the brest of it. Being applied in a bag, together with line-seed, it taketh away the stich and pain in the sides: but some put *hyssope* thereto, and a little pepper. A liniment made therewith, cureth the spleen. Being parched or roasted and giuen with meat, it keepeth the body soluble. And *Hippocrates* affirmeth, that the said seed is very good to be taken in drink, for to cleanse the matrice in women: and being so parched and giuen to the quantity of one *Acetabulum* in sweet wine cuit, it allaieth the griefe and paine of the said part, in case withall there be a cataplasme applied to the region thereof, together with the juice of *Mallows*. If it be taken in hydromel, or honied water, together with salt, it expelleth

M

(by

(by his saying) the worms in the belly. Applied in a liniment to the bare and naked places of the head, it causeth the haire to grow again, and bringeth all to the former beauty. Many doe use to make a cataplasme of Nettle-seed and old oile, or els stamp the leaues together with Bears greafe, for the pain of the gout, and verily for that purpose, as also for the spleen, the root poune with vineger, is no lesse effectuell. Being boiled in wine, it discusseth and driueth down risings in the groine, and such like emunctories, so it be laid too with old hogs greafe salted. But the same root dry, is a very depilatorie, and fetcheth haire off. *Phanias* (the naturall Philosopher and Physitian) in a feuerall treatise which he made in the praise of Nettles, professeth, That he knoweth not the like remedy to the Nettle, boiled first and then condite, for the windpipe, the cough, the distillation and flux of the belly, the stomacke, the biles and botches in the emunctories, the swelling and inflamed kernels behind the eares, and kided heels. The same with oile procureth sweat, and soddeth with muscles, and such like shell-fishes, it moueth to the stoole: with prisane or barley broth, it purgeth the brest, and sendeth down womens termes: applied with salt, it restraineth vlcers that be corrosiue and apt to run & spread farther. The juice also of the Nettle, serueth to many vses, for being pressed forth & laied as a liniment to the forehead in a frontall, it stancheth bleeding at the nose. The same taken in drinke, prouoketh vrine, and breaketh the stone: but if one gargle with it, it staies the Vvula from falling: as for the feed, it ought to be gathered in haruest time: & that which is brought from Alexandria, is esteemed best: for all the particular diseases aboue rehearsed, the kinder and gentler Nettles also, euen those that be yong and tender, are knowne to be of good operation; but principally that wild kind before said; and this property moreover it hath, To rid away the leprosie out of the face, if it be taken in wine. Finally, if a foure-footed beast will not abide to be couered or serued with the male of that kind, an ordinary practise it is, to rub the nature or shap with a Nettle, for that will make her stand to the fellow.

CHAP. XIII.

¶ Of *Lanium*, and the medicinable vertues thereof.

AS touching that dead-Nettle, which among the other kinds we named before *Lanium*, *i. Archangel*, it is the mildest of all others and most tractable, for the leaues bite not nor sting at all. The same, if it be applied with some corns of salt, to contusions and bruises, to deep burns, the Kings euill, swellings, gouts, and wound's, cureth them all. The white that it hath in the mids of the leafe, is singular for *S. Anthonies* fire, the shingles, and such like. Some there be of our Latine writers, who treating of Nettles, haue couched them in their ranks respectiue-ly to the time, saying, That the root of a Nettle which commeth in the Autumne, cureth the tertian ague; but it must be tied fast to the Patient: and these ceremonies are to be obserued also in the taking it forth of the ground, That the party be named for whom it is gathered; the feuer also, of what type or kind it is; yea and who be the parents of the sick person; and then hee or shee shall be sure to be deliuered of that disease. The said root, with the same circumstances, is of the like operation to driue away the quartan ague also. The selfesame authors do asseme moreover, That the root of a Nettle being applied with salt, draweth forth all thorns and shiuers that stick within the flesh. Also, that a cataplasme of the leaues and hogs greafe incorporat together, doth resolueth the scrophules or swelling kernels called the Kings-euill: or if they are come to suppuration, eateth and worketh them forth, and doth incarnat & fil vp the place again

CHAP. XV.

¶ Of the herb *Scorpius*: the sundry kinds thereof, and the medicinable properties.

THere is an herb called * *Scorpius*, which took that name of the resemblance that the head hath to a scorpions taile. Few leaues it beareth, but (according to the name) it is good against the sting of scorpions. Another herb there is of the same appellation, & of like effect to the other; but it sheweth no leaues at all; the stalke is smooth, and resembleth garden Sperage: in the top or head whereof, there is a pricke to be seen like a sting, which gaue occasion of the foresaid name.

CHAP.

CHAP. XVI.

¶ Of *Leucacantha*, and the vertues thereof good in Physicke,

THe Greeks, some call this Thistle, *Leucacantha*, or the white thistle; others, *Phyllon*: some *Ichias*, others, *Polygonaton*; but be the name what it will, it hath a root resembling that of * *Cyperus*, which if it be chewed in the mouth, allaieth the tooth-ache. *Hicestus* saith likewise, That if either the seed or the juice of the root thereof, be taken in drinke to the weight of eight drams, it assuageth the pain of the sides and loins. The same also cureth ruptures, conuulsions and crampes.

CHAP. XVII.

¶ Of *Helxine* or *Perdicium*, called also *Parthenium* or *Sideritis*, and the vertues medicinable.

AS for *Helxine*, some call it *Perdicium*, because Partridges delight most to feed thereupon; others name it *Sideritis*, and many giue it the name of *Parthenium*. Leaues it carrieth of a mixt form and resemblance, between Plantain and Horehound. The branches or small stalks grow in thick tufts, and those be of a light reddish colour: the seed in the head, of a Bur kind which sticketh to folks cloaths, whereupon they would haue it to be called *Helxine*. But in the former booke I haue described the form of the right * *Helxine* or *Parietarie* indeed. The property of this herb is to giue a tincture or die to wooll: it healeth the shingles and *S. Anthonies* fire: it cureth swellings, and all apostemations of humours, yea and also burnes. The juice thereof incorporat with ceruse or white lead, and so applied, serueth greatly for biles and botches, *S. Anthonies* fire, tumors, gatherings and risings in the flesh; yea and helpeth them whose throat begins to swell. Also if a man take the quantity of one cyath thereof, it cureth inueterat and old coughs: it healeth all infirmities either occasioned by phlegmatick humors, or els incident to moist parts: like as with oile rosat it is a proper medicine for the accidents of the amygdals about the passage to the throat, and for the swelling of veins. Moreover, if it be reduced into the form of a cerot, with goats suet and wax of Cypres, and so applied, it cureth the gout. Moreover, *Perdicium* or *Parthenium* (for *Sideritis* is another herb) our countrey men call in Latine, * *Vrcolaris*, of others, *Astericum*. In lease it is like to Basil, saue only that it is blacker; it groweth vpon tile-houses, and old decaied wals, and such ruinous places. Being beaten into powder & applied with corns of salt, it hath the same operation that the Nettle *Lanium*, and cureth the self same diseases; and the one is vsed in like sort as the other: & if the juice be drunk hor, it is singular for inward and secret imposthumes full of filthy matter, and driueth them outward. Also it is excellent for vlcers, ruptures, and bruises, whether it be that one hath tumbled head-long from some high downsall, or that he hath bin crushed by the ouerthrow of some waggon or chariot. It fortuneth that a Page of *Pericles* a prince of the Atheniens (whom he loued intirely) hauing climed vp to the top of the lanterne or spire of a temple which the said prince built in the castle or citadell of Athens, fel downe from thence, who was cured by the means of this herb, reuealed vnto *Pericles* in his sleep by the goddesse *Minerva*: whereupon it tooke the name first of *Parthenium*, and is consecrat vnto the said goddesse: this is that Page whose molten statue is to be seen at this day made of brasse: this is (I say) that noble and famous image called * *Splanchnoptes*.

CHAP. XVIII.

¶ Of *Chameleon* the bearbe, the sundry kinds thereof, and the vertues medicinable.

CONCERNING *Chameleon*, some there be who name it *Ixias*: whereof be two kinds: the whiter hath the rougher leaues: it creept close by the ground, and setteth vp stiffe prickles in manner of an *Vrchin*: the root is sweet in tast, but of a most strong sent. In some places it ingendreth a white kind of gum or clammy glew, vnder the wings or arm-pits (as it were) of the leaues, after the same manner as *Frankincense* is said to breed, but especially about the

* Parietarie of the wall.

* Where, to say a truth, he describeth *Helxine* for *Jxine*, or *Chameleon* the white.* Diof. Cerato *Cyprie*.* or *Vitraria*, because it is vsed to scoure glasse and pipkins withall.

* Made with a duffie to blow coles & kinde fire for to roast the inward parts of beasts sacrificed: or as some thinke, it was the proper name of that youth.

rising of the Dog-star: & for that it is like to a kind of birdlime, it is called Ixia: our women vse this instead of Mastick. And the reason why this herb is named Chamæleon, is by occasion of the variable leaues which it beareth, for according to the nature of the soile where it groweth, it changeth hew; whereby in one place you shall haue it blacke, in another green; here you shall see it look blew, and there yellow, and euermore altering the color. Of which Chamæleons, the white cureth such as are in a drop sicke, if the root be boiled, and the iuice thereof taken to the quantity of a dram in sweet wine cuir. The measure of one acetabule of the same iuice, if one drink in a green harsh wine made of the hedge vnripe grape, wherein certain bunches of Origanum haue lien infused, it is thought to be a singular remedy to kill the worms that breed in the guts. It auaileth much also to help those who pisse with difficulty: and yet this iuice being giuen to dogs or swine in barly groats, killeth them. If there be water and oile mingled thereto, it draweth rats and mice to it, but it is their bane, vnlesse presently they drinke water. Some prescribe for to cut the root thereof into thin roundles, and to keep them enfiled vp, or hanging by a string, and then to seeth them; for to be eaten against the flux of humours, which the Greekes name Rheumatismes. Of the black kind, some hath named that the male, which hath the purple floure; and the female with the violet colour. They all grow vp with one stem and no more, and the same is a cubit high, and a finger thick. The roots are good to heale ringworms, tetter, and such like wild fires, if they be foddened together with brimstone and Bitumen: but if the said root be chewed in the mouth, or a collution be made therewith foddened in vineger, it fastens the teeth which shake and be loose in the head. The iuice of this root healeth the scab or mange in four-footed beasts. Herewith also folke vse to kill the ticks that breed in dogges: but it stoppeth the wind of heifers and young steers in manner of a squinancy: and therefore of some it is called Vlophonon and Cynozolon, in regard of the strong and stinking smell that it hath. These Chamæleons do beare a certain viscos gumme, most proper for vlcers. And the roots of all the sort of them, as well blacke as white, are singular against the poison of serpents.

CHAP. XIX.

¶ Of Coronopus or Harts-horne, with the medicinable vertues thereof.

Coronopus is an herb bearing long leaues, and those clouen into certain fissures and knags: and howsoeuer it groweth wild, yet otherwhiles it is set and sowne in gardens, for the excellency of the root, which being roasted vnder the ashes, is soueraign for the flux, & weakness of the stomacke.

CHAP. XX.

¶ Of Orchanet or Alkanet, as well the right as the bastard, and their properties in Physicke.

The root of Orchanet is much vsed about medicines: of the thicknesse it is of a finger: it will rend and cleaue in manner of the papyr reed: and it coloureth the hands of as many as handle it, with a red and bloody colour: it prepareth wooll and woollen cloth for to take rich and deep colours. If it be incorporat into the form of a cerot, it healeth vlcers, especially in old men; as also places that be burnt. It cannot be resolued in water, but it is oile that must dissolue it: and verily this is a good experiment of that which is true and nothing sophisticat. A dram thereof giuen in wine to drink, is singular good for the pain in the kidnies: but in case the Patient haue a feuer vpon him, then it ought to be taken in the decoction of *Balanos. In like manner is it to be vsed in the opilations or obstructions of the liuer, of the spleen, and in the laundise. A liniment made of it and vineger, cureth the leprosie, and the red pimples arising in the face. The leaues stamped with hony and meale vntill they be incorporat together, and so applied as a cataplasme, are thought to be good for dislocations: but if they be taken inwardly to the quantity of two drams in honied wine, they bind and knit the belly. The root boiled in water is said to kill fleas.

Another herb there is much like vnto it, and thereupon called Pseudanchusa [i. bastard Orchanet] of some, but of others Enchusa or Doris; and many other names it hath besides. More full of downe or hairy mosse it is, and lesse fatty; but the leaues are smaller, more ranke and feeble.

A feeble. The root yeeldeth no oleous substance, but a reddish iuice, wherein it differeth from the right Anchusa or Orchanet. The leaues or seed being taken in drinke, is a most effectual counterpoison against serpents. The substance of the leaues being applied to the places which bee stung, are soueraigne for to cure and heale them vp. The very herb it selfe chafeth away all poison of serpents. There is a drink made thereof, commended highly for the chine or ridge bone of the back. The Magicians do prescribe the leaues to be bound vnto some part of the Patient against a tertian ague, with this charge, That they be gathered with the left hand, & that in the gathering, the party or patient for whose sake they are gotten, be named.

CHAP. XXI.

B ¶ Of Onochiles, Anthemis, Lotos, and Lotometra: of Turnsole-Tricoccus: of Adiantum, and Callitricheon.

Another herb there is, particularly named Onochiles, which some call Anchusa; others Arcebion or Onochelis; some Rhexas, and many Enchusa: a small herb this is, it carrieth a purple floure, leaues and branches rough: a root in harvest time as red as blood, otherwise black; and groweth in sandy grounds: effectually it is against serpents, and Vipers most of all others, both in the root and leafe, as well eaten with meat as taken in drinke. In the full strength it is in harvest. The leaues if it be bruised or stamped, do yeeld the sauer and smel of a Cucumber. If the matrice of a woman be slipt downe, a draught of three cyaths thereof, doth reduce it vp into the place: and together with hyssope, it driueth out the broad wormes in the belly. For the pain of the kidnies or the liuer, it ought to be taken in mead or honied water, if the Patient haue an ague withall; otherwise in wine. The root brought into a liniment, cureth the Lentils or red spots, yea and the infection of the leprosie. And it is said, That as many as haue it about them, cannot be stung by serpents. There is yet another Orchanet or Anchusa like vnto this, in regard of the red floure which it beareth, howbeit a lesse herb than the other, hauing the like operation, and imploied in the same vses. It is reported, That if one chew it in his mouth, & spit it forth vpon a serpent, the same will surely die thereupon.

As touching Anthemis [i. Camomile] Asclepiades the Physitian doth highly praise and commend it. Some name it Leucanthemis, others Leucanthemus; & there be, who giue it the name D Eranthemion, because it flourisheth in the Spring; others againe name it Chamæmelon, for the sent or sauer that it hath of an Apple: many call it Melanthenon. Three kinds there be of it, differing onely in the floures (for none of them exceed an hand-breadth in height) which be small, and in forme resemble those of Rue: howbeit, these floures be either white, yellow, or red. In a lean ground and neer to beaten paths, this herb loueth to grow: gathered it is in the spring, and layed vp for to serue in garlands: at which time the Physitians also stampe the leaues and make them vp into Troches: so do they also by the floure and the root. This vertue they haue, That if they be all mingled together to the weight of one dram, they are thought to be a soueraigne remedie against the sting of all serpents. This herbe expelleth dead infants within the mothers wombe, if it be taken in drinke. It bringeth downe also the monthly fleurs of women; prouoketh vrine, and sendeth forth the stone and grauell. Being chewed, it dissolueth ventosities, it cureth the obstructions and defects of the liuer, it helpeth the jaundise, healeth the fistules between the angle of the eye and the nose, and generally all running sores and mattering vlcers. But of all these kinds, that which beareth the red purple floure hath most effectually operation for the stone: and indeed, both the leaues, and also the branches of this Camomile, are somewhat larger than of the rest: and some there be, who giue this a name it selfe, and call it Eranthemion. As for those who take Lotos to be a tree only, may be conuincied euen by the authority and testimony of Homer, who among other herbes growing for the delight and pleasure of the gods, hath named Lotos as principall. The leaues of this herbe incorporat with hony, and so applied, cureth the cicatrices or scars in the cie; the spots also appearing therein, and dissolueth the cloudy skins which ouercast the sight: there is a kind of Lotos named Lotometra, comming of the garden Lotos: it carrieth a seed like to Miller, whereof in Egypt the Bakers make bread: but they work & knead the floure of this seed with water or milk. There is nor any bread in the world (by report) more wholsom and lighter than this, so long as it is hot; but being once cold, it is harder of digestion, & becometh weighty & ponderous. This is known for certain,

*Haply liee

kind of Dates
appropriate for
agues.

that as many as liue thereof are infested & troubled neither with the dysenterie or bloody flux, ne yet with the trouble some offers and strains to the sieg without doing any thing, nor any other diseases of the belly: and therefore it is counted a principal remedie for those maladies. Concerning Turnsol, I haue oftentimes related the wonderfull nature thereof, namely, how it turneth about with the sun, although it be a close and cloudy day (so great is the loue of this herb to that planet:) and in the night season forwant of the Suns presence, as if it had a great misse thereof, * it draweth in and shuddereth the blew floure which it beareth. Two kinds there be of this Heliotropium or Turnsol, of which the lesse is called Tricoccum, the other Helioscopium: of the twain, this later is the taller (and yet neither of them both exceedeth halfe a foot in height) and putteth forth branches from the very root. The seed of this greater sort lieth within a little cod, and is gathered in harvest time: it groweth not but in a fat soil well manured, whereas Tricoccum comes vp every where. I find, that if it be boiled it is a pleasant and delectable meat; but foddren in milk it loosneth the belly gently and with ease: for otherwise the bare colature of the decoction in water, if it be taken, purgeth most extremely. The juice of the greater kinde ought to be drawn or gathered in summer at noontide; which, if it be tempered with wine, becommeth more strong and effectual. A property it hath being mingled with oile of roses, to mitigate the head-ach. The juice drawn out of the leafe, medled with salt, takes away werts: whereupon our herbarists haue called the herb in Latine Verrucaria. Wertwort: whereas indeed for other better effects and operations that it hath, it deserueth to haue some denominations correspondent thereunto: for, a countre-poison it is against serpents and scorpions, if it be drunk with wine or honied water, as *Apollonphanes* and *Apollodorus* do report in their writings. A liniment made of the leaues cureth the rheumes and distillations of the braine in children, which disease they call * *Siriasis*. Likewise it helpeth contractions of sinues, and the drawing in of joints, although the patient be taken after the manner of the falling sicknesse: and for such as be thus afflicted, a fomentation made of the decoction of this herb, is very wholesome and comfortable: but if one drink the colature thereof, it thrusteth forth the wormes in the belly, and scoureth out the grauell in the kidnies. If Cumin be put thereto, it breaks the stones ingendred and confirmed there already. Boiled it ought to be root and all, the which with the leaues and goats tallow, being reduced into a liniment, is singular good for all kinds of gout.

* This is called *Arder capitis* by Pliny himselfe, and is an hot distemperature of the head.

The other kind which we call Tricoccon, and is otherwise named Scorpion, hath not only smaller leaues, but also they incline and bend downward to the ground. A seed it beareth resembling the figure of a scorpions taile, whereupon it took that name. A liniment made therewith is powerfull against all venomous beasts, and namely the perillous spiders Phalangia, but specially against the poison of scorpions. And in truth, look who carry this herbe about them shall not be stung. If a man make a circle or compasse vpon the earth with the branch of this herb, a scorpion (as some say) being within the same, shall not haue the power to get forth: nay, if the herb be laid vpon a scorpion, or if with the same being wet a man besprinkle the said scorpion, it wil surely die out of hand. It is said, that foure grains of the seed taken in drink, do cure the quartan, and three the tertian: or if the very herb it selfe be laid vnder the patients head, after it hath bin thrice caried about the bed, it worketh the like effect. The seed is of power to stir vp carnal lust. Applied with hony, it discesseth biles rising in the emunctories. Yea & this Heliotropium for a certaintie causeth werts to fall off by the very roots: as also it taketh away all excrescences in the fundament. It draweth down by vrin the corrupt blood in the reines and loins, lying cluttered about the ridge bone, in case the seed be either applied as a liniment, or foddren in the broth of a cock or capon, and so supped off, or else with Beers and Lentils. As for the utmost rind of this herbe, it is singular for to recouer the fresh and natie colour in places black and blew with stripes. The Magicians and Wife-men do prescribe for the quartan & tertian agues, That the Patient should tie the herbe Heliotropium, with three knots in a tertian, and with four in a quartan, praying withall and making a vow, That he would vndo those knots after he were once cleare of the feuer: but this he must do before the herbe be taken out of the ground.

* Maidenhair.

Another property as strange and miraculous is reported of * *Adiantum*: in Summer it is green: in winter it withereth and decaith not: it checketh all water, for being bespreint, dashed, and drenched quite therewith, yet it looketh as if it were dry: so great is the antipathy or contrarietie between them: whereupon the Greeks gaue it that name. And otherwise a plant

- A it is fit for Viner-workes and knots in a garden. Some call it Callitrichon, others Polytrichon, both which names were giuen it for the effect that it worketh. For it colareth the hair [black] And for this purpose it is foddren in wine with the seed of Ach or Persley: and a good quantity of oile is put thereto, for to make the haire curled and to grow thick, by which meanes it keeps the hair from shedding and falling off: 2 kinds there be of it, the white and the black, which also is the shorter. The greater kind they call Polytrichon: the other, Trichomanes. Both of them haue pretie fine branches shining with a blacke color, and the leaues resemble fearn, in which, the nether sides vnderneath be rough, dusky, and browne: but all the leaues stand directly one against another in order, fastened to the stalkes by slender steles. No root at all these Capillar hearbes haue: but they grow vpon shadowie rocks and walls, dashed and beaten on with water: but most of all they seek after pits or holes of wels and springs, and stony places wherout fountains issue: and that is a strange & marvellous thing, considering they be not wet with water, nor haue any sence or feeling thereof. They haue a wonderful faculty, and the black especially, to break the stone, and to expel it out of the body. For which cause, rather than for growing on stones and rocks, I beleue verily it was by our countrymen called in Latin Saxifrage. To this purpose, as much as 3 fingers be able to pluck vp, is ordinarily taken in wine: they prouoke vrin: and resist the poison of serpents and venomous spiders. Being boiled in wine, they stay the flux of the belly. A Chaplet made of them, allaieth the head-ach. And a liniment thereof is thought good to be applied against the sting of the Scolopendres: but it must be often taken off and renewed, for feare the hearbe become ouer-drie and lose all the vertue. In this wise it is to be vsed where the haire is fallen away by some infirmite. These hearbes discesse and resolute the kings euill: they dispatch and rid away the scales or dandruffe in the visage, and heale the skals of the head. A decoction of these Maiden-haires, is singular good for those who are short winded: for the liuer also, the spleene, the jaundise, and the dropie. An ointment made with Maiden-haire and Wormewood, easeth the paines of the kidney: and in case of strangurie, procureth ease and free passage of vrine. They bring downe the after-birth in women, and their monethly tearmes. Howbeit, drink them with vinegre or the juice of the blackberrie bramble, they stanch blood. A proper liniment is made thereof with oile Rosat, to annoynt young children that haue the red gum and be all broken out: but first they would be bathed in wine. The leaues of Maiden-haire stamped with the vrine of a man child vnder foureene yeares of age, and yet not vndergrowne, together with the some of salt petre, is said to keep the bellies of women from wrinkles and riuels vpon child-bearing, if they be annoynted therewith. To conclude, men say, That Partridges and cockes of the game will fight more lustily, in case this hearbe bee entermingled with their meat. And the same also is very good for sheepe to graze vpon about their folds.

CHAP. XXII.

¶ Of *Picris*, *Thesium*, *Asphodell*, *Alimus*, *Acanthus* or *Erankursine*, *Elaphoboscum*, *Scandix*, *Isosone*, *Of* *Caucalis*, *Sium*, *Silybum*, *Scolymus*, or *Zimontium*, *Sonchus*, *Chondrillum* or *Chodrilles*: and of *Mushromes*.

- E The hearbe * *Picris* tooke the name (as heretofore we haue said) of the notable bitterness which it hath. The leaues thereof be * round. Excellent good it is to take away werts. *Thesium* likewise commeth nothing behind for bitterness: but it purgeth the bellie: for which purpose it must be stamped, strained, and taken in water.

As touching the *Asphodell*, it is one of the soueraign & most renowned herbs in the world. Some haue giuen it the name Heroion. And *Hesiodus* hath written that it growes in the woods. *Dionysius* saith, That there is both male and female of it. Certain it is, that the bulbous roots of the asphodell foddren with husked barley, is a singular restorative for those bodies which are wasted with a consumption, & especially of the lungs: and bread made of them, wrought together with corne meale of flour into a dough, is most wholesome for mans bodie. As for *Nicander*, he vsed to giue either the stem which we called *Antherichon*, or the seed, or els the Onion bulbous roots thereof, in wine, to the quantitie of three drams, as a preservative against serpents & scorpions: and to preuent the feare and daunger of these harmefull and pestilent creatures, hee appointed the same to be laid vnder folks heads as they lay asleep. Visually also is this herb giuen against venomous fishes of the sea, and the Scolopendres of the land. In Campaine, the shell-snails

* A kind of Cichorie. * So are none of our Cichories.

haue a wonderfull ull spight against the maine stalk of this hearbe Asphodel, for they neuer lin sucking it, vntill they haue made it as drie as a kex. The leaues also are reduced into a liniment, for to be applied to enuemenomed wounds, occasioned by such serpents & hurtful beasts. Likewise an ointment may be made of the bulbous roots thereof, stamped together with Barley groats, for to annoint the sinews and joynts. Good it is also to cut them into roundles, and therewith together with vinegre, to rub ring-wormes and tetteras. In like manner if they be applied with water, they doe cleane putrid and rotten vlcers, yea, and the hot apostemations of the paps and the cods. Beeing foddren in wine lees, and so laid to the eies with a fine linnen rag betweene, they cure the flux of humors thither, which causeth the eyes alwaies to water. Generally in any disease whatsoeuer, Physicians vse the root of this hearbe boiled for the most part, rather than otherwise: likewise for the mor-males and vgly sores in the legs, they vse the powder of them dried: as also for the fissures and chaps appearing in any part of the body. Now, the only fit and conuenient season to gather these roots is in Autumne, at what time they bee most in force. Being stamped raw, or foddren, there is a iuice pressed forth of them: which is soueraigne with honey, for any paines of the bodie, whether it be the collicke, or seated in the muskles. And the same being mixed with the drie root of Flower-de-lis, and a little quantity of salt, is passing good for those that affect a sweet smell, and would palliate the ranke sauer of any part of the body. Moreover, the leaues of the Asphodel serue for all the former maladies, as also for the kings euill: for red and flat biles, gout-rofar, sauce-fleame, ale-pocks, and such like vlcers in the face; if the same be foddren in wine, and therewith the grieved parts bathed. The ashes of the root burnt, bring hair againe vpon the head where it was lost and gon, and healeth vp the chaps and rifts in the feet. The iuice of the root foddren in oile, is good for libed heles, for burns or skals. To help the hardnes of hearing, the same iuice is to be dropped into the eares, but to assuage the tooth-ach, it must be infiltred into the ear of the contrary side. The same root taken in drink moderately, is singular for to procure vrine, to prouoke womens moneths, and to mitigate the paine of the sides or pleurisie. But giuen in wine to the weight of one dram, it cureth ruptures, conuulsions, or cramps and coughs. The same being chewed, helpeth forward vomites, and causeth them to come with more ease. The seed, if it be taken inwardly, troubleth and wringeth the belly. *Chrys-sermus* the Physician vsed to boile the root in wine, and therewith cured the swelling kernills and inflammations behind the eares: also, with an addition of * Cachrys and wine, he healed the kings euill. Some say, that if one take the Asphodel root, and lay one part thereof to those swelling kernills called the kings euill, and remoue it vpon the fourth day, letting the other part to hang in the smoke, the said kernills wil drie away, euen as the root doth in the chimney. *Sophocles* (for the gout) vsed the root both waies, as well raw as boiled. In case of humble-heels he applied it foddren in oile: but to them that were fallen into the jaunise or dropcie, he gaue it in wine. Some writers haue set down in their books, that if either the members of generation be anointed with a liniment made therewith and wine and hony together, or if the same be taken in drink it will mightily prouoke fleshy lust. *Xenocrates* affirmeth, That a decoction of the root in vinegre taketh away the ring-worms, tetteras, & running scabs. *Item*, If the root be boiled with Henbane and Tar, and therewith the armholes and parts between the legs be well rubbed, it wil rid away the strong and rank sauer which commeth from thence, and if the head be first shauen, & afterwards rubbed with the said root, the haire comming afterwards will curle and frizzle the better. *Simus* the Physician boileth it in wine, and so giueth it in drinke, for to scoure away the stones of the kidnies. *Hippocrates* prescribeth to giue the seed against the hardnes of the spleen and the flux proceeding from thence: furthermore, the root being brought to a liniment, or the very iuice thereof foddren and vsed accordingly, healeth the farins, mange, and scab, in horses, and reduceth the place to bear hair againe as faire as before. Asphodel hath a property to chase away mice and rats: and if their holes be stopped vp therewith, they die within.

Some are of opinion, that *Hefod*. called *Alphodel*, a limon; which I take to be a meer vnttruth: for ther is an herb by it self called *Alimon*: about which writers haue erred not a little: for some say, that it is a shrub growing thick, of a white color, without any prick or thorn, bearing leaues like the Olive tree, but they be softer: & this plant is entertained in the kitchen, being sodden and dressed for to be serued vp as meat to the table: the root taken to the quantity of one dram in honied water, dispatcheth the torments of the belly: it cureth also conuulsions and ruptures. Others affirme, that * *Alimeth* is a sea-wort, of a salt and brackish tast, whereof it had the name.

The

A The leaues be round, and yet after a sort long withall: and the whole herb is highly commended for the pleasant tast, and good to be eaten. Moreouer, there be two kinds of it: for the one is wild, the other is of a more ciuill and gentle nature. And both of them, by their saying, are good to be eaten with bread for the bloody flixe, euen when the guts be already exulcerate: but with vinegre, for to comfort and help the stomack. A liniment made of Alimon raw, is singular for old festered vlcers, and the same mitigateth the symptomes that follow green wounds: as also assuageth the pains ensuing vpon sprains and dislocations of the foot: yea & pacifieth the grief of the bladder. The wild of this kind hath smaller leaues, but more effectuell it is in the remedies before said: and withall, healeth the scab as well in man as beast.ouer and besides, they do affirm, That if the body be rubbed with the root, the skin wil be the fairer and more smooth: or

B if the teeth be so ferued they will be the whiter. Also that whosoever hold the feed thereof vnder their tongues, they shall not be dry nor feel thirst. This kind is likewise eaten at the board, and both of them are kept and preserved condite. *Criteus* hath made mention of a third sort, which hath longer leaues than the rest, and more rough in the hand, in smel resembling the Cipres tree, who saith, that it delighteth principally to grow vnder the Yuie tree: which if it be taken to the weight of 3 oboli in a sextar of water, helpeth those that haue their heads & bodies drawn far back, and such as be troubled with the contraction and shrinking of sinues.

As touching Acanthus or Brankurfine : an herb it is cherished much in gardens, proper for vinets and story-works, bearing vpright and long leaues, wherewith beds-sides and borders of quarters in gardens are decked and beautified. Two kinds there be of it : one with prickly leaues in manner of thistles, and the same jagged, which is the lesse & lower of the twain : but the greater, which some in Greeke call Paderos, others Melamphyllon, is smooth leaued. The leaues of this Brankurfine being applied, are wondrous good for burns and dislocations. Also being sodden with meat, and especially with Ptisane or husked barley, it is singular for those who are bursten, troubled with the crampe, and subiect to the consumption of the lungs. Also if they be stamped and reduced into the form of a liniment, and laid too hot, they cure the gouts proceeding from an hot cause.

The herb *Bupleuron is reckoned by the Greeke writers in the number of woits that grow of themselves : a stem it hath of a cubit in height, many leaues, and those growing long in a spoke-tuft or rundle in the head, in manner of Dill ; highly commended by *Hippocrates* for good meat, but *Glycon* and *Nicander* praise it as much for the vse thereof in Physick: and in very truth the seed is powerfull against serpents. The leaues also or the very iuice incorporate with wine into the form of a liniment, they imploy for to bring down the afterbirth of women newly deliuered : as also the leaues with salt and Wine are vsed by way of cataplasme, for to dissolue the swellings called the Kings eith. As for the root, it is vsually giuen in wine against venomous serpents, and to prouoke vrine.

* Buprestis is an herb about which the Greek writers haue shewed themselves, namely, how inconstant and light of credit they be ; in that they haue so highly praised it to be a speciall wholsum meat, yea and a singular remedie against poisons. For the very name sheweth evidently that it is a poison it selfe, of kine and oxen at leswise. And they themselves do confesse, that if such cattel tast of * Buprestis it wil make them enraged, and fall a gadding vntil they burst in sunder. And therefore I wil not speake any more of this herb, for there is no reason that may induce me to describe these venomous weeds among those that serue for the green garlands aforesaid made of gresse: vnlesse haply it be this, That some one or other would seek after this herbe to weare it in a chaplet for lust-fake : * which indeed they say it wil prouoke no lesse that way, than if it were taken in drinke.

* Elaphoboscon is an herb growing vp with a main stem, after the manner of Fenel-giant: the same is full of knots and joints as thick as a mans finger. The seed is made after the fashion of berries hanging downe in manner of Sili or Siler-mountaine; howbeit nothing bitter they are, and the leaves resemble those of Alifanders. This herb is taken for a commendable meat; and in truth is kept also and preferred a long time confected and condite, for a singular remedie to procure vrin, to allay the pain of the sides in the pleurisie, to heale ruptures, to cure convulsions and cramps, to discusse ventosities, to assuage the dolorous torment of the collicke, yea, and as a very countre-poyson against the sting of serpents and all other creatures armed with stings: for the report goeth, That stags and hinds by feeding thereupon withstand the venom of Serpents.

* Some name

pents. The root also reduced into a liniment with Sal-nitrum put thereto and incorporate together, cureth old sores called fistulae. But the said root ought to be dried first for those purposes, to the end that it should not be full of the own juice and moisture: and yet this humour dulseth not the vertue thereof, nor maketh it lesse effectually against the sting of serpents.

Touching the herb * Scandix, the Greeks haue ranged it also among the wild worts, or pot-herbs good for to be eaten, according to *Opion* and *Erasistratus*. The same being sodden, knitteth the belly and stoppeth a laske. The seed taken with vinegre presently stayeth the yox or hiequer: it prouoketh vrin, and serueth well in a liniment to heale vrburns. The juice of it being boiled to a juleb, is good for the stomach, liuer, kidnies, and bladder. This is the herb which *Aristophanes* the Comedian twitted the Tragical Poet *Euripides* by, obiecting vnto him merily by way of a scoffe, that his mother, who was a gardener, vsed to sit in the market and sel neuer a good wort or pot-herb indeed, but made her markets only of Scandix. And verily I would say that * Anthriscus were the same herb, if it had smaller, tenderer, and sweeter leaues. This peculiar praise and commendable propertie it hath, that if the body be overlaid and wearied with the vse of women, it restoreth the spirits and refresheth them again. Yea & such as be wel slept in yeares, and begin to droup, it maketh lusty and able to perform the act of generation youthfully. It stayeth the flux of the whites in women.

Moreouer, * Iassione is counted also a wilde wort, comming vp of it selfe and good to be eaten. This herb creepeth by the ground, full of milke it is, and beareth a white floure which some call Concilium. The like name and commendation there goeth of this herbe for stirring vnto letcherie. Being taken raw with meat in a vinegre sauce, it breedeth plenty of milke in women. A singular restorative it is for them that feeble themselves wearing & decaying by a consumption. A liniment made therewith and applied to the head of yong infants, causeth hair to come vp thicke: and by shutting the pores of the skin more close, it is a means to retain the hair till that it shed not easily.

As for * Caucais, an herb like to Fenel, but that it hath a short stalke and a white floure: it is good also to be eaten, and is besides counted a cordial. A drink likewise is made of the juice thereof, passing comfortable to the stomach, of power to prouoke vrin, to expel grauel & stone, and to stay the itching within the bladder: it doth subtiliar the grosse and rough flegm which causeth obstructions in the spleen, liuer, and kidnies. The seed being taken inwardly helps toward the monthly sicknesse of women when it stayeth vpon them, and drieth vp the cholericke humors which flow after child-birth, or the after-burden. It is giuen also to men for the spilling of natural feed, or the running of the reins. *Chrysippus* is of opinion, that it is singular good to help women for to conceiue, if they be desirous of children. But the maner is to drinke it in wine next the heart fasting. And as *Petrus* the Poet hath deliuered in verse, a liniment of this herb is singular against the poisons of venomous sea-beasts.

Among these herbs is reckoned * Sion, a plant growing in waters of it selfe, with leaues like Parsly or Smallach, but that they be larger, fatter, & of a deeper blackish green: it beareth seed plentifully, and in tast resemblerth water-Cresses. It is thought to be excellent good for those that cannot make water, for the diseases of the reins, and paine of the spleene, yea and for women whose monthly termes are suppressed; whether the substance thereof be taken as meat, or the juice of the herb decocted, or the seed drunk in wine to the weight of two drams. It breaks the stones ingendered within the body, and notwithstanding it groweth in water, yet it euacuateth those aquosities and waterie humors which ingender the same. Being elixerized it helps those that haue the bloody flux. If women anoint their faces with a liniment made of it ouer-night, it doth embelish their skin at one instant and with one dressing: yea, it taketh away the pimples and spots that disfigure the face, in maner of Lentils. This ointment is held also to be good for the farins and such sores, in horses and such like beasts, and to mitigat the grienous paines and trouble of any ruptures.

As concerning Silybus, an herbe like vnto the white Chamæleon, and as full of thornes; it groweth abundantly in Cilicia, Syria, and Phœnice: and yet in these countries they make not so much account of it as to bestow the dressing of it, it asketh so much adoe in the kitchen, before it be in case to be serued vp in the hall. And for physicke there is no goodnesse in it at all.

The plant * Scolymus is vsed also much to be eaten in the East parts, where they call it by another name Limonia: It neuer exceedeth a cubit in height: the leaues be crested: the root blacke,

A blacke, but yet sweet. *Erastophenes* commendeth it as a principal dish for a poor mans table: and it is said that it hath a special vertue to prouoke vrine: and with vinegre if it be applied, to cure the foule tettars called Lichenes, and the leprosic also by the testimony of *Hesiodus* and *Aleues*, if it be taken in wine, it inciteth to wantonnesse and fleshly pleasures. These Poets doe write, That when this herbe doth flourish and is at the best, then grasshoppers chaunt loudst and sing most shrill: and as women at such a time be most desirous of mens company and hottest in lust, so contrariwise men are most loth to turn vnto them, and least able to content their appetites: as if Nature to satisfie the pleasure of these good wifes, had prouided against that faint season, the help of the Artichoke, as a viand most powerful at this time to fet their husbands in a heat, and to enable them to that businesse. Moreouer, an ounce of the root cleafed from the pith, B sodden to the thirds in three hemines of the best Falerne wine, and either taken in drinke vpon an empty stomach, presently after that one hath sweate, and is new come forth of the Baine: or else to the quantitie of one cyath immediately after euery meale, doth correct and take away the stinke and ranke smell of the arme-pits. And a straunge thing it is, that *Democritus* affirmeth vpon his owne experience, and promisseth, That this decoction is of such efficacie, that it causeth the said strong sent to passe away by the vrine.

Moreouer, the * Sowthistle is an hearbe for to be eaten, for we read in the Poet *Callimachus*, * Sonchus. That the poore old woman *Hecale*, at what time as prince *Thescus* fortun'd on necessitie to take his repast in her simple cottage, made him a feast, and set before him a principal dish of Sowthistles. Two kinds there be of them, the white, and the black: both, like vnto lettuce, but that they are full of prickles. They run vp into a stalke of a cubite in height, the same is cornered and hollow within, but brake it, and you shall see it run out with milke plentifully. The white, which hath that bright colour of the milke within it, is thought to be as good as Lectuces, for those that be streight winded, and cannot take their breath but vpright. *Erasistratus* sheweth plainly, That if it be eaten, it expelleth grauel by vrine: and chewed only, it correcteth the stinking sauer of the mouth, and causeth one to haue a sweet breath. The juice thereof drawn to the measure of three ciaths, made hot in white wine and oile, and so taken, helpeth women in labor, that they may be soone deliuered, but presently after they haue drunk it, they ought to stir their bodies and walke vp and down their chamber. Also it is vsed to be sodden in broth, and so supped vp. The very stalke therof being boiled, maketh milch nourses to haue good store of milke, and the children at their breast to be better coloured. But most excellent it is for such nourses as feeble their milk to cruddle in their breasts. The juice thereof dropped into the ears, doth them much good, and a measure of one cyath drunk hot, is as good for the strangurie. But in the fretting and gnawing of the stomach, it would be taken with Cucumber seed and Pine-nut kernells. Applied in form of a liniment, it cureth the apostemations in the fundament. A drinke is made thereof, which is a countrepoyson against serpents and scorpions: but then the root also must be laid outwardly vnto the sore place. The same root boiled with oile within the pill of a pomgranat, is a good remedie for the paines and maladies of the ears. Note, that all these vertues must be vnderstood of the white Sowthistle. And *Cleomporus* doth accord hereunto as touching the white, but he alloweth in nowise to eat of the black, for he is of opinion, that it breedeth diseases. *Agathocles* also prescribeth the juice of the white Sowthistle to them who haue drunk Bulls blood, and suspect themselves poysoned therewith. Howbeit, they be all agreed, that the blacke is refrigeratiue: in which regard it ought to be applied outwardly with Barly groats. *Zenon* declareth, That the root of the white Sowthistle, cureth the strangurie.

As for * Chondrilla or Chondrille, it hath leaues like to Endiue or Cichory leaues gnawed or eaten round about: a stem not a foot high, and the same full of a bitter iuice: a root like vnto * Beans, and otherwhile there be many of them together. This hearbe putteth forth close to the ground a certain kind of gum like Mastick, swelling out to the bignesse of a Bean, which being applied to the naturall parts of women, is said to draw down their monthly courses. The same hearbe being stamped root and all together, and digested into trosches, is thought to be singular good against serpents: and a probable reason herof is collected, because the field mice and rats when they are stung by serpents, haue recourse to this herbe, and eat thereof. The juice drawne out of this herbe, after it is sodden in wine, bindeth the belly. The same is singular good to redifie, couch and lay even the disorderly hairs of the eye-lids, as effectually as the best gum in the world. *Dorotheus* the Poet hath deliuered in his verses, that it is good for the stomach, and helpeth

* Gum Succi coria.

* Dioscorides, it is full and fresh: but it seemeth that Plinie read it otherwise.

helpeth digestion. Some hold opinion, That it is naught for women & hurtful to the eies, also that it is contrarie to the seed of man and doth hinder generation.

Among all those things which are earen with danger, I take that Mushromes may iustly be ranged in the first and principal place: true it is, that they haue a most pleasant and delicate tast, but discredited much they are and brought into an ill name, by occasion of the poyson which *Agrippina* the Emperesse coueighed vnto her husband *Tiberius Claudius* the Emperour, by their means: a dangerous president giuen for the like practise afterwards. And verily by that fact of hers, she set on foot another poyson, to the mischiefe of the whole world and her owne bane especially (euen her own sonne *Nero*, the Emperour, that wicked monster.) The venomous qualitie of some of these Mushromes, may be soone known by their weak rednesse, their mouldy hew so vnpleasant to see to, their leaden and wan colour within-forth, their chamfered streakes full of chinks and chaps, and finally, their edges round about pale and yellow. For others there be that haue none of all these markes: but are drie, and carie certain white spots like to drops or grains of Sal-nitre, putting forth in the top out of their tunicles. And in truth, before that the Mushrome is formed, the earth bringeth forth a certain pellicle or coat first, called in Latin *Volua*, for this purpose, that the Mushrome should lie in it: and then afterwards shee engendreth it enclosed within, much like as the yolke of an egge crunched within the white. And so long as the Mushrome is young and not come forth, but lieth as a babe within, the said core or tunicle is as good meat as the Mushrom it selfe: but so soon as the Mushrom is formed, this membran breaketh, and incontinently the body or substance therof is spent in the stele or foot that beareth it vp: and seldom shall you see 2 Mushromes vpon one of these steles or feet. Moreover, these mushrooms take their first originall and beginning of a slimy mud, and the humor of the earth that is in the way of corruption: or els of some root of a tree, & such for the most part as beare Maist. It seemeth at the first, as if it were a kind of glutinous some or froth, then it growes to the substance of a pellicle or skin, and soone after sheweth the Mushrom indeed, bred, formed, and consummat within, as is aforesaid. And verily all such are pernicious and vterly to be rejected neer to which when they come new out of the ground, there lay either a grieue-stud or leg harneis-naile or some rustie yron, or so much as an old rotten clout: for looke what naughtinesse foucer was in any of them, the same they draw and conuert into venome and poyson. But none are able to discern these hurtful Mushromes from others, how curious and circumspect foucer they be, save only the peasants of the country where they grow, and such as haue the gathering of them. And here is not at all the mischiefe that lieth in them: For dangerous they be otherwise, and meet with more meanes to make them deadly, namely, if a serpents hole or nest be neare by, or if at their first discouerie and comming forth, a serpent chance to breath and blow vpon them: for so prepared they be and disposed as a fit subject, to enter, that presently they will catch and entertain any poyson. And therefore on any hand we must not be bold and lusty with them before the time that serpents be retired into the ground, & there taken vp their harbor. Which is an easy matter to know, by the tokens of so many herbs, trees, & shrubs, which from the time that they first came abroad above ground, vntill they haue taken vp their winner lodging again, looke alwaies fresh and Greene: and principally by the leaues of the Ash, alone, if there were no more trees: for Ashes neither bud and spring forth, but after that serpents come abroad, nor shed and fall away, before they be gone into the ground again. In summe, this would be noted, That Mushromes be vp and down, come and gon, alwaies in a feuen-night space. Thus much of the Mushromes named in Latine *Boleti*.

CHAP. XXIII.

¶ Of other Mushromes or Tad-stoles called *Fungi*. Of *Silphium*, and *Lasfer*.

As touching those excrescences in manner of Mushromes, which be named *Fungi*, they are by nature more dull and slow. And albeit there bee many kinds of them, yet they all take their beginning of nothing els but the slimy humor of trees. The safest and least dangerous be those, which haue a red callositie or outward skin, and the same not of so weak a red, as that of the Mushromes called *Boleti*. Next to them in goodnesse are the white, and such as haue a white foot also, beir a head much resembling the *Flamins* turban or mitre, with a tuffet or crest in the crown. As for the third sort that be called *Suilli*, as one would say, Swine-Mushromes

A rooms or Puffs, they are of al others most perilous, and haue the best warrant to poison folk. It is not long since that in one place there died thereof, all that were of one household; and in another, as many as met at a feast and did eat thereof at the same bourn. Thus *Annius Serenus*, capitaine of the Emperour *Nero* his guard, came by his death, with diuers coronels and centurions, at one dinner. And I wonder much, what pleasure men should take thus to venture vpon so doubtful and dangerous a meat. Some haue put a difference of these mushrooms, according to the severall Trees from which they seeme to spring, and haue made choise of those that come from the Fig-tree, the * Birch, and such as beare gum. For mine own part, as I haue said before, I hold those good that the Beech, Oke, and Cypress trees doe yeeld. But what assurance can a man haue hereof, from their mouths who sit in the market to sell them? for all the sort of those Puffs and Toadstooles look with a leaden hew and wan color. Howbeit, the nearer that a Mushrome or Toadstoole commeth to the color of a fig hanging vpon the tree, the lesse presumption there is that it is venomous.

Touching the remedies for to help those who suspect they haue eaten these dangerous mushrooms, I haue said fomewhat already, and wil say more hereafter. Mean while this would be noted, that as perilous as they be, yet some goodnesse there is in them, and diuers medicines they doe yeeld. First and foremost, *Glaucias* thinketh and affirmeth, That the Mushromes *Boleti* be good for the stomacke. As for the swine mushrooms, named in Latin *Suilli*, they are hanged vp to dry insiled vpon a rush running through them, as wee may see in those that come out of *Bithynia*. And these are supposed to be singular for those fluxes and catarrhs that take a course to the belly and breed fluxes, called by the Greekes *Rheumatismes*: these cure the excrescences of the flesh, that rise in the fundament; for they eat them down, & in tract of time consume them quite: also they are good to take away the pimples and freckles that appeare vpon the skin, like to Lentils, yea and the deformities and spots in womens faces that disfigure their beauty: these mushrooms be * washed as lead, for to enter into collyries and eye-salues: and a liniment is made thereof, which being applied with water, cleanseth filthie sores and vicers, cureth the skals that breake out in the head, and healeth the wounds occasioned by the biting of dogs.

And now for that our fine mouthed and dainty wantons who set such store by their tooth, take so great delight to dresse this only dish with their own hands, that they may feed thereon in conceit and cogitation all the while they bee handling and preparing the same, furnished in this their buisnesse with their fine knives and rasors of amber, and other vessels of siluer plate about them: I for my part also am content to frame and accomodate my selfe to their humorous fantasie, and will shew vnto them in general, certaine obseruations and rules how to order and vse them, that they may be eaten with security. Marke then those mushrooms, which in the seething proue hard and tough, such be all of them hurtfull: Lesse dangerous they be, if some salt-nitre be put to them whiles they be a boiling ouer the fire; provided alwaies, that they be fully sodden before they be taken off. Also, a man may be more bold to eat those which be sodden together with flesh meat, or with the tailles or steles of peares. The eating also of peares immediatly after one hath fed vpon Mushromes, doth kil or dull all the malice that they may haue. Also vinegre is of a contrary nature vnto them, and doth extinguish or mortifie their venomous qualitie. To conclude, all these mushrooms do come vp and are engendred in rain. Semblably, good showres doe breed *Silphium*.

This *Silphium* came at the first from *Cyrene* (as I haue before written) but now adays, since time that all the *Cyrenaick* *Silphium* is destroied and gon (as hath bin said) the greatest store thereof is brought out of *Syria*: howbeit so good it is not as that which *Parthia* yeelds, though it be better than that which the merchants bring ouer with them out of *Media*: this * *Silphium* is of great vse in Physicke; for the leaues are sodden in white odoriferous wine: of which decoction, there is made a drink for to cleanse and purifie the matrice, and to expell the dead infants therein; so it be takn to the measure of one *Acetabulum*, immediatly after the woman hath bin in the stoue, and there swet. The root is singular for to cleare the windpipes, and to take away all the asperity and roughnes in those parts; and being applied in form of a liniment, it helpeth *F* impostumat inflammations proceeding from the ranknes and ebullition of the blood: & yet as many as take it at the mouth and eat therof, find that it is hard of digestion; for it breedeth ventosities and causeth much belching. Hurtful also it is and contrarie to the free passage of vrine. A liniment made thereof together with wine & oile, is a most familiar and agreeable medicine

* or *Laserpisium*.

for the black and blew marks remaining after stripes: but if the same with some addition of wax, be reduced into a cerot, it healerth the Kings euil. The piles or werts growing in the fundament, with a suffumigation of Silphium oftentimes vsed, will fall off.

As for the liquor Lafer, issuing from Silphium (in that maner as I haue shewed) it is holden for one of the most singular gifts that Nature hath bestowed vpon the world, and entrench into many excellent confections and compositions. Of it selfe alone, it reduceth those to their naturall heat, who are staruen and benumbed with extreame cold. Taken in drinke, it allaieth the accidents and griefes of the nerves. It is both giuen to women in wine, and applied also in soft locks of wooll to their natural parts, for to bring down their mensrual purgation. If it be mixed and incorporat with wax, it draweth and fetcheth out by the roots, the agnells or corns in the feet, if so be they be scarified round about before with the lencer. Being dissolued in some convenient liquor and taken to the quantity of a cich pease, it prouoketh vrin. *Andrew the Physician* doth assure and warrant vs, That if it be taken in greater quantity, it breedes no windinesse in the stomacke, but helpeth digestion mightily both in women and also in old men: Who saith moreover, that it is better and more wholesome in winter than in summer, and for those especially who drinke nothing els but water: only they must look to this and take heed, that there be no exulceration within the body. A great restorative it is with meat, and quickly setteth them on foot, who haue lien along and bin brought low by sickness: for Lafer if it be applied in due time, is as good as a potentiall cautery * to raise a blister: but better it is for them who are acquainted with it, than for those who haue not bin vsed to it. Outwardly applied, no man makes doubt but it is of singular operation, and worketh many effects: taken in drinke, it extinguisheth the venome left in the bodie, either by poisoned dart, or serpents sting: and if the wounds be anointed with the same, dissolued in water, it is the better: but particularly for the prickles of scorpions, it would be applied with oile. Also in case that vlcers will not grow to any maturati-
on, nor yeeld from them concocted matter, a pulres made of Lafer, together with barley floure or figs, is a singular digestiue. Being laid too with Rue, or hony, or by it selfe alone (so the place be anointed ouer it with some viscus gum to keep it too that it run not off) it is excellent for the carbuncle, and the biting of dogs. If it be sodden in vinegre with the rind or pil of a pomegranat, it is passing good for the excrescences rising about the tiwil, if the place be bathed with that decoction. Being incorporat with Sal-nitre, and well wrought withall beforehand, and so applied, it taketh away the hard horns and dead cornes arising in the feet, which commonly be called in Latin Morticini. Tempered with wine & saffron and pepper, or if it be but with micedung and vinegre, it is a good incarnatiue in vlcers: & an excellent drawer to the outward parts for to fil vp the skin and make a bodie fat. A good fomentation there is made of it and wine, for to bath kided heels: for which purpose, it is boiled in oile and so applied. In like manner, it serueth to soften hard callosities in any place whatsoeuer: and for the foresaid corns of the feet especially, if they be scarified & scraped before, it is of great efficacy. Singula it is against vnwholsom waters, pestilent tracts, and contagious airs, as in times suspected of infection. Soueraigne it is for the cough, the fall of the Vvula, and an old jaunise or ouerflowing of the gall: for the dropsy also and hoarsnesse of the throat; for presently it skoureth the pipes, cleers the voice again, and maketh it audible. If it be infused and dissolued in water and vinegre, and so applied with a sponge. It assuageth the gout. Taken in a broth or thin supping, it is good for the pleurisie, especially if the patient purpose to drinke wine after it: being couered al-ouer with wax to the quantity of one cich pease, it is giuen very well in case of contractions & shrinking of sinewes, and namely to such as cary their heads backward perforce, by occasion of some crick or cramp. For the squinancie, it is good to gargarize therewith. Semblably it is giuen with leeks and vinegre, to those that wheaze in their chest, and be short winded, & haue had an old cough sticking long by them: also with vinegre alone, to such as haue supped off and drunk quailed milke, that is cluttered within their stomack. Taken in wine, it is singular for the faintings about the heart; as also for colliquations and such as are saln away and far gone in a consumption, & those that be taken with the falling sicknes: but in honied water, it hath a special operation respectiue to the palsie, or resolution of the tongue. Vvith sodden honey and Lafer together, there is made a liniment, very proper to anoint the region of the hucklebone, where the Sciatica is seated; and the small of the backe, to allay the pain of the loins. I would not giue counsel (as many writers doe prescribe) for to put it in the concauitie or hole of a rotten tooth, and so stop vp the place close

* He meaneth by Cauterium, a medicinall medicine, which doth draw humours and the blood to the habit and outward parts: a necessarie course to be taken in Atrophie, and namely after long diseases, that the body may be equally nourished.

A close with wax, for feare of that which might ensue thereupon: for I haue seene the fearfull sequel of that experiment in a man, who vpon the taking of that medicine, threw himselfe headlong from an high loft and brake his necke; such intolerable paines he sustained of the toothache: and no maruell, for do but anoint the muffle or nose of a Bull therewith it wil set him on a fire & make him horn-mad: and being mingled with wine, if serpents (as they are most greedy of wine) chance to lap or lick thereof, it wil cause them to burst. And therefore I would not aduise any to be anointed with it and hony of Athens incorporat together, howsoeuer there be some physicians who set down such a receit. Certes, if I should take in hand to particularize of the vertues that Lafer hath, being mingled with other matter in confections, I should neuer make an end. But my purpose is to deale with simples only, wherein Natures work is most apparent & euident to be seen; whereas in compositions we go altogether by coniectures which some physitions vs: neither can a man be assured of their operation; for who is able to obserue the iust proportion in these mixtures, either of the contraries and repugnances, or the concord and agreement of the ingredients in Nature? But of this point I will write more at large hereafter.

CHAP. XXIV.

¶ Of the nature and properties of Hony. Of honied water or Mead called Hydromel. How it cometh to passe that the manners and behaviours of men be altered by meat and vintages. Of honied wine named Melittes, and of Wax. Also against the abuse in composition of medicines.

Hony, were it not so common as it is, and euery where to be had, would be as high esteemed and of as great price as Lafer. As for this drug, Nature hath framed and made it immediately her own self; but for the getting and working of hony she hath created a liuing creature of purpose, as we haue already said: by means whereof we haue this celestial liquor, which serueth for an infinite number of vses, considering how often it entrench into mixtures and compositions. And first to speak of that cereous substance Propolis, which, as it hath bin shewed already, offereth it selfe first to be seen at the very entry of the Bee-hiue. These vertues medicinable it hath, namely to draw forth all prickles, thorns, and what offensive thing soeuer sticketh within the flesh of a body; to dissolue and dissipate all tumours and swelling bunches, to concoct and mollifie any hardnesse, to assuage the pains of sinewes, and finally to incarnate, heale vp, and skin any desperat vlcers.

As touching Hony it selfe, of this nature verily it is, That it wil suffer no dead bodies to putrifie, notwithstanding it be of a sweet and pleasant tast, far from any aegrenesse, and contrary to the nature of salt: for the throat, the kernels of each side thereof called the Tonsils or Amygdals; for the squinancie, and all the accidents befalling to the mouth; as also for the drinnesse of the tongue through extremite of heate in feuers, it is the most soueraigne thing in the world. Hony boiled is singular for the inflammation of the lungs, and for the pleurisie: also it cureth the wounds inflamed by the sting or teeth of serpents; and helpeth those who haue eaten venomous mushrooms. Being taken in dulcet or honied wine, it cureth those that lie of a palsie; although indeed the said honied wine alone hath many gifts and properties by it selfe. Hony together with oile of Roses dropped into the ears, cureth their ringing and pain. Good it is also for to kil lice and such like vermin in the head, and to rid away nits: where note by the way, that if hony be dismured, that is to say, skummed and clarified, it is euermore the better for any vse. Howbeit, the stomack it puffeth vp and maketh to swell with ventosities: it ingendred and encreaseth cholerick humors, and taketh away appetite to meat: yea and some are of opinion, that being vsed simply alone, and not compounded with other things, it is hurtfull to the eyes: and yet others giue counsel to touch and anoint the corners of the eyes therewith, when they be exulcerat. Touching the materiall cause whereof honey is ingendred, the maner how the diuers sorts, the countries where it is made, the price also and value, with the sundry proofs and tria's thereof, I haue writtten already once in my treatise of Bees; and a second time in my discourse of the nature of Floures: for so the order and course of this my Worke forced me to treat distinctly of those matters; which, they that be desirous to know exactly the nature of Simples, may put together and mingle again at their pleasures. By the same reason also, since we are en-

tered into the vertues and operations of Honey, I must of necessitie handle and declare the qual-
tie of Hydromel or honied water, so neere a dependant thereto.

Of which there be two kinds: the one is fresh and new made in haile vpon occasion, and presently vsed: the other is kept and preferued. As touching the former Hydromel, if it be made as it should be of dispumed and clarified hony, it is of singular vse in that exquisit & spary diet fit for sick persons, and namely in meats of light digestion, such as is a thin gruell made of naked frumenty washed in many waters: also to be ioyned in restoratiues for to recouer the Patients strength much enfeebled. Moreouer, good it is for the mouth and the stomacke, to mitigate the fretting humors fetled and bedded therein, & to cool the extremity of heat: for I find in good authors, that to ease and mollifie the belly, it is better to be giuen cold than otherwise:.

• Somerade
μαρμαρις.
out of Dioscor.
having a faint
& weak pulse.
• *Corpusculus*
verum.

also that it is a proper and conuenient drink for those who chile and quake for cold: likewise for such as be heartlesse & haue smal or no courage at all, whom those writers call * Micropsychos.

Moreover, there is a reason rendred full of infinite subtiltie, and the same fathered first vpon *Cato*, Why the same things feel not alwaies bitter or sweet alike in euery mans tast? for he saith that this diuersitie proceedeth from those little mores or * bodies that go to the making of all things: whiles some of them be smooth, others rough & rugged, some cornered, others round: in sum, according as they be more or lesse respectiue and agreeable to the nature of each man: this is the cause, that those persons who are ouer-wearied or exceeding thirsty, be more cholericke and prone to anger. Good reason therefore, that such asperity of the spirit, or rather indeed of the vital breath, should be dulced and appeased by the vse of some sweet and pleasant liquor which may lenifie the passage, and mollifie the conduits of the said spirit, that they do not cut, race, and interrupt it going in & out in drawing or deliuering the wind. And in very truth, euery man may find by experience in his own self, how meat and drink doth moderate and appease anger, sorrow, heauinesse, and any passion or perturbation of the mind whatsoever. And therefore those things would be obserued which make not onely to the nourishment and health of the body, but also serue for to rectifie and reform the maners and demeanour of the mind.

Now to return again vnto our Hydromel or honied water, very good, by report, it is for the cough, and being taken warm it prouoketh to vomit: put oile thereto, and it is singular against the poison of Ceruse or white lead. A countre-poison also it is and a preferutiue to such as haue eaten Henbane and Dwale, especially taken with asses milk, as I haue obserued hertofore. Instilled into the ears, or poured into the fistulous sores of the secret parts, it is thought to be excellent. Incorporat with the crums of soft bread, and reduced into the form of a pessarie, and so put vp, it is singular for the infirmities of the natural parts of women; and being applied accordingly, it taketh down all sudden swellings [occasioned by windines,] cureth dislocations, and in one word, mitigareth all pains. Thus much of Hydromel new made: for our moderne physicians haue vtterly condemned the vse of that which is kept vntill it be stale. And this they generally hold, That it is not so harmlesse as water, nor so solid and powerfull in operation as wine. Howbeit let it be long kept it turneth into the nature of wine, and (as all writers do accord) then is it most hurtfull to the stomack, and contrary to the finewes.

As for honied wine, the best and most wholesome is alwayes that which is made of the oldest wine, that is hard: and indeed with it you shall haue it to incorporate very easily; which it will neuer do with any that is new & sweet: and being made of green, harsh, or auster wine, it doth not fill and charge the stomacke, no more it doth being made of boiled honey; and ingendreth lesse ventosities, which is an vnaul thing with hony. This honey bringeth them to appetite of mearwhome haue lost their stomack. Taken actually cold, in many it loosneth the belly; but being hot it stayeth and bindeth the same. The honied wine is very nutritiue and breedeth good flesh. Many haue held out a long time fresh and lusty in their old age, with the nourishment of honied wine alone without any other food: whereof we haue one notable example of *Pollio Romanus*, who being aboue an hundred yeres old, bare his age passing well: whereat the Emperour *Augustus* of famous memorie maruelled much; and being vpon a time lodged as a guest in his house, he demanded of him, what means he vsed most for to maintain that fresh vigour both of body and mind? to whom *Pollio* answered, By vsing honied wine within, and oile without. *Varro* saith, that the yellow jaundise was called a * Kings disease, or a sicknesse for a King, because it was cured ordinarily with this honied wine, called Mulse.

As touching another kind of honied wine, named Melitites, how it is made of Must, or new wine

A wine & hony together, I haue declared sufficiently in my treatise of wines. But I suppose there hath bin none of this sort confected these hundred yeares past and above, for that it was found to be a drink which bred ventositities in the stomacke and other inward parts. Howbeit, the manner was in old time, to prescribe it for to bee giuen in agues, to make the bodie soluble; prouided alwaies, that it had the due age: also to those who lay of the gout: to such likewise as had weake and feeble sinews: and to women who abstained altogether from meere wine.

Next after Honey, the treatise of Wax (which is correspondent to the nature of honey) by good order followeth. Concerning the original working and framing thereof, the goodnesse, the several kinds according to diuers countries, I haue written in conuenient place. This is generally obserued that all sorts of wax be smelting, burning, and consuming.

Beneficially considered, that all sorts of wax be emollient, heating, and incarnative; but the newer and sweeter they are, the better they are thought to be. Wax taken inwardly in a supping or broth, is singular for the bloudy flux and exulceration of the gurs: so be the very honey-combes giuen in a groll made of frumenty, first parched and dried at the fire. Contrarie it is to the nature of milk: for take ten grains of wax, made in smal pills of the bignesse of miller corne, in some conuenient liquor, they will not suffer the milke to cruddle in the stomacke. If there be a rising or swelling in the shate, the present remedie is to sticke a plaistre of white wax vpon the groune. Moreover, to reckon vp and decipher the sundry yses that wax is put vnto in matters of Physicke, as it is mixed with other things, it is no more possible than for Physitions to

Cize of other simples and of their whole virtues, according as they enter into many compositions which proceed all (as I haue said) from the wit and artificiall inuention of man: for we neuer find, that Cerors, Cataplasms, Emollitiues, Plasters, Collyries or Eye-salues, Antidotes or Preseruatife confections, were euer of our great mother daine natures making: who indeed is the diuine worke mistresse of all things, these are the deuises of Apothecaries, nay they are rather tricks proceeding from avarice and couetousnesse. As for Nature, she hath made nothing vnperfect, her workes be absolute all and accomplished in their essence: ordained hath shee no compounds, vnlesse it be very few, wherein she proceedeth vpon good cause and reason, and goeth not by blind aime and doubtfull coniectures: as namely, when according to her rule and order, shee doth incorporate some things of a drie constitution and substance, with a liquor, that they may pierce & enter better within the pores of the body, or els when the giuer of life

D to liquid matters by some bodily substance, which may vnite and knit them together. To goe about for to compasse the vertues of euery simple ingredient in these compositions curiously by scruples and graines, fauoureth of impudencie rather than a worke grounded vpon humane conjecture. For mine owne part, I haue nothing to doe with these drugs and far-fet wares that come from India and Arabia: I meddle not (I say) with these medicinable spices brought out (as it were) of another world. These simples growing so far off in such remote countries, please me not, neither do I thinke them meet for to cure our maladies: they were neuer brought forth by Nature for vs, no nor for them neither, where they grow: otherwise they were not such fooll (I trow) as to sell and passe them away as they doe. Buy them, and spare not, for sweet pomanders, perfumes, and delicate ointments: ye may buy them also (if you please) vpon a superstitious deuotion for the worship of gods, for that now we cannot sacrifice, pray, & serue God (forsooth) without Fragments.

without Frankincense and Costus. And that our daintie ones and effeminate persons should be the more ashamed of themselves, I will the rather shew and prooue, That we may both preferre and recouer our health well enough without the exotical and foraine drugs: and that ech region is furnished sufficiently with home-physicke of their owne. But now, since we haue taken so much paines as to collect the medicabile vertues of guirland-floures, of pot-herbes also, harden woorts, and fallad hearbes, How may I for very shame leaue out the properties of corne and grain seruing for Physick: and therefore in this place it shall be well done, to discourse of them likewise.

CHAP. XXV.

¶ *The medicinable vertues and properties of corne and graine.*

First and foremost this is holden for certain, that they be the most ingenious and wisest creatures of all others, which live of corn. The grains of the fine blanched wheat Siligo, being burnt, brought into powder, and applied with Ammoniac wine in manner of a liniment, doe

restraine the flux of humors to the eies. Also the cornes of the ordinary wheat *Triticum*, being parched or roasted vpon a red hot yron, are a present remedie for those who are scorched and findged with nipping cold. The meale of the said wheat sodden in vinegre, and applied as a cataplasme, helpeth the contraction and shrinking vp of the sinews: but wheat brans, with oile of roses, drie figges, and sebesten sodden together, make a collution, the gargarizing wherewith, is good for the inflammation of the Tonsils or Amygdales, and to cure all the accidents of the throat. *Sextus Pompeius*, who in his daies was one of the principal peers of high Spain, & left a sonne behind him, who afterward was lord Pretour of Rome, sitting on a time before his barnedores to see his corn winowed, was surprised sodainly with a fit of the gout, and whether it were by chance, or in a rage for the extremitie of paine, thrust his legs about the knees into the heap of wheat lying thereby: but finding his legs mightily dried hereby, and himselfe wonderfully eased of his paine by that means, he neuer vsed any other remedie afterwards, but so soone as he felt a fit of his gout comming, he plunged his feet and legs into a heap of wheat. Certes wheat is such a desiccatiue, that it wil draw and drie vp the wine or any other liquor in a barrell which is buried within it. Moreouer, the best experienced Chirurgians in the cure of ruptures, affirm, That there is nothing better, than to lay the chaffe of wheat or barley hot to the griued place, and to foment the same with a decoction wherein it was sodden.

As for the bearded wheat Far, there is a certaine worme breeding in it like to a moth or the grub that eateth wood, which is singular good to make rotten teeth to fall out of the head; for if the same be lapped within wax, and so put into the hole of the faultie tooth, it wil drop out: or if the found teeth be but rubbed therewith, they will shed and fall forth of the head.

Touching the graine Olyra, we haue said already that it is called also Arinca. The Egyptians make thereof a certaine medicinable decoction or gruell, which they call Athara, passing good for young babes; yea and it serueth to bath and annoint elder folke withall.

Barly meale either raw or boiled, doth discusse and resolu, assuage & ripen, all impostumes engendred either by way of gathering and collection of humours, or by some deflux and rheumatick descent. The same otherwhiles is sodden in honied water, or els with dried figs: but for the paines of the liuer, it had need to be boiled with Oxycatre, i. water and vinegre together, or els with wine. But when the case standeth so, that the tumor must be partly dissipated, & partly brought to maturation, then it is better that it be incorporate in vinegre, or the lees of vinegre, or at least waies in sodden peares or sodden quinces. Being tempered and medled with hony, it is very good for the biting of the cheelips or many-foot worms, called Multipedes: but for the sting of serpents, it is better to mix it with vinegre; as also to keep sores from festering and rankling, but in case it be needful and requisit to cleanse them from suppurat matter therein gathered, then it would be applied with vinegre and water, with rosin also and gal-nuts added thereto. For inueterat and old vlcers, to bring them to maturation, it is laid too with rosin: for to soften hard tumors, it is vsed either with pigeons dung, or with drie figs, or ashes. Being applied with Poppie or Melilior, it is singular for the inflammation of the nerues, of the guts & sides: also for the paines of mens priuie parts: or when the flesh is departed from the bone. Incorporate with pitch, and the vrine of a boy not yet vndergrowne nor fourteene yeares old, it is a proper medicine for the swelling kernels named the Kings euill: with oile and Fenigreeke, it helpeth the tumors of the midriffe and precordiall parts: or in case the feuer be busie with the Patient, then it must be vsed with honey or old greafe. But if those swellings tend to maturation, then wheat meale is commonly more lenitiue, and assuageth pain better. The same being reduced into a liniment with the iuice of Henbane, is good for the nerues; but with honey and vinegre, it taketh away the red pimples and spots appearing in the skin, called Lentils.

Touching *Zea, whereof is made the ordinary frumenty as I haue said: the meale of it is counted better in operation than the other of barley, but that of the three-moneth corn is more moist and emollatiue. Tempered with red wine, and so applied warm, it is commended for the pricke of Scorpions: also for them that reach and spit vp blood: and all accidents happening to the throat and windpipes: but with goats suet or butter, it is good for the cough. The floure or meale of Fenigreeke, is the softest of all other: it healeth running vlcers, it skoureth dandruffe or scales in any part of the body, it appeaseth and assuageth the paines of the stomack, it cureth the maladies incident to the feet and paps, if it be sodden with sal-nitre and wine, and so applied accordingly.

The

A The meale of Yurain or Darnell, doth cleanse old vlcers and gangrenes more than any other: Tempered with raddish, salt, and vinegre, it cureth ring-worms, tetteras, shingles, and such like: with Sulphur-vif or quick brimstone, it scoureth away the leprosie. Applied in a frontall to the forehead with Goose-greafe, it helpeth the head-ache. Boiled in winewith Pigeons dung and other biles which be long ere they gather to an head and do ripen.

Of the sundry sorts of Barly groats or grossemeale called Polenta, I haue said enough in my Treatise of corn, which did require also the discourse of such things as be made of corn. It differeth from Barly meale, in that it is torrifed or parched: in which regard it doth the stomack good. It bindeth and staith the flux of the belly: it represseth also and smiteth back the flu-

B shing of humors, to the breeding of red and angry tumors. It serueth for a liniment to the eies, and easeth head-ach, if it be applied with *Mints, or some other cooling herb. In like manner it cureth kibed heels, and the wounds occasioned by serpents: also it healeth burnes and scalds if it be laid too with wine: and in that sort it keepeth them from blistering. If meale be driuen through a fencer or boulder, and so reduced to floure, and afterwards made with dough or paste, it is a great drawer of noi som humors to the outward parts: which is the cause that being applied to such places which look dead & mortified, by reason of the blood spread vnder the skin, it draweth out the same, so that the very linnen bands wherewith they be lapped & rolled, become bloody again. But if wine cuite be ioined therewith, the operation is more effectually. Moreouer, the said floure is good to be laid vnto the callosities and corns of the feet. For the fine floure of meale being sodden with old oile and pitch, and applied so hot as the patient may abide it, doth wonderfully cure the swelling piles and all other griefs about the fundament. As touching the thick gruell or paps made with floure, it nourisheth much, and causeth the body to feed wel: the past made of meale, wherewith they vse to glew Papyr, is ordinarily giuen warm to good effect, for the reaching and spitting of blood.

As for the frumenty called Alica, it is a meere Roman inuention, and not long ago first deuised: for otherwise the Greeks if they had known of it, would neuer haue written as they did in the commendation of husked Barly named Prifana, rather than of it. And I thinke verily, that the vse thereof was not taken vp in the daies of Pompey the great, and therefore the followers and disciples of *Asclepiades* haue left little or nothing thereof in writing. That it is a soueraign and most wholsom thing, no man verily maketh doubt or question, whether it be washed and so giuen in honied water, or whether it be sodden and so vsed in a thin supping, or boiled higher to the consistence of a thick gruell or pottage. The same for to stay the belly, and stop a lask, is torrifed: and then afterwards sodden with virgin wax, as before I haue shewed. But a peculiar vertue it hath by it selfe to restore those that are consumed and fallen away through a long & languishing sicknesse: and then it must be ordered thus. Take three cyaths of the said Frumentie, seeth it in a sextar of faire water ouer a soft fire gently, vntill by little and little all the water be consumed: now after this inbibition, when that the Frumenty hath thus drunk vp all the water, there must be added thereto a sextar of Ewes milk or Goats milk, and in the end a little hony. This the patient is to take for certain daies together. And in truth, such a broth or supping is this, as there is not in the world a more soueraigne restoratiue for all colliquations and consumptions whatbeuer, nor that will sooner set vpon their feet again those who be far gone and spent that way.

To come now to Millet, it is a grain, which being torrifed aforehand for the purpose, stoppeth the lask, and dispatcheth all collick pains and torments of the belly. Being fried and laied too hot in a bag, there is nor a better thing for the grieve of the sinews, or to alay any other pain: for, most soft it is, and lightest of all other, and nothing in the world retaineth heat so well. No maruell then if Millet be vsed ordinarily in those cases, where heat is to do good. To conclude, the meale or powder thereof incorporat with tar, is a singular plaister to be laid vpon sores, occasioned by the sting of Serpents or the pricke of the vermine named Multipeda.

F As for the Panick, *Diocles* the Physitian called it Mel-frugum. The same operations and effects it hath that Millet. Being taken in wine, it is good for the dysentery or bloody flux: to such tumors as need to euaporat and be resolu, it is singular good for to be applied hot, by way of fomentation. Sodden in Goats milk, and giuen twice a day to drink, it bindeth the belly, & staith flux: and in that manner it assuageth the torments and wrings in the collicke.

Sesama

Vide Galen,
lib. i. de Natu-
ralibus facult-
atibus.

Spela

* Cum Mentha,
rather Melle,
i. honny, accord-
ing to Colum-
ella: for
Mints be hot.

Sesama stamped or beaten into pouder, and so taken in wine, restraineth immoderat vomits. G Reduced into a liniment, and so applied, it doth mitigat the inflammation of the ears, & cureth any burne or scalt place of the body. The same effects it hath when it is green & groweth in the field.ouer and besides, a cataplasme made thereof, being boiled in wine, is good for sore eyes. To be eaten, it is no wholsome meat for the stomach: and more than that, it causeth a stinking breath. Howbeit, they hold it excellent to withstand the venomous sting of the Stellions, and the dangers that it may inferre: as also to heale the old cancerous and maligne vlcers, named Cacoethe, & Morimals. There is an oile made thereof, which as I haue before shewed, is good for the eares.

Touching Sesamocides, which taketh that name of the resemblance that it hath to Sesama, but that the graine thereof is bitter, and the leafe lesse, and it groweth in grauelly grounds: the same being taken to drink in water, purgeth chollerick humors. A liniment made of the seed, doth assuage the heat of S. *Anthony's* fire, and doth discusse and resolute biles. And yet there is another Sesamocides growing in Anticyra, which thereupon some do call Anticyricon: otherwise much like it is to the herb Groundswell, whereof I will speake in place conuenient. The graine or seed of this Sesamocides is giuen in sweet wine, as a purgatiue of chollerick and flegmatick humors; to the quantity of as much as may be contained with three fingers: but to quicken the same, the Physitians vse to put one Obole and an halfe of the white Ellebore-root or Neefewort: which purgation they vse in case of madnesse, the melancholicke disease, the falling sicknesse, and the gout. By it selfe alone, the weight of one dram is a sufficient laxatiue, & doth euacuat the belly.

The best Barley is that which is whitest. The iuice of Barley boiled in rain water, is made vp into certain trofches, which is singular good to be either conueied into the guts by way of clyster, for the exulceration thereof, or els injected into the Matrice by the merrenchyle, for the vlcers therein. The ashes of Barly burnt, are good in a liniment for Burnes, for places where the flesh is gone from the bones, for wheales, and small pocks, and for the biting of the Hardishrew mouse. The same with a little sprinkling of salt, and some honey amongst it, is counted a good dentifrice, to make the teeth look white, and the breath to smel sweet. There is an opinion commonly received, That whosoever vse to eat Barly bread, shall not be troubled with the gout of the feet. And they say, that if a man take nine barly corns, & with euery one of them draw three imaginary circles about a felon with his left hand: and when he hath so done, throw them all into the fire, presently it shall be cured. There is an herb which the Greeks call Phoenicea, and our countrymen in Latine Hordeum * Murinum. This herb or weed being beaten to pouder, & taken in wine, is singular to bring down the course of womens fleurs.

Hippocrates the famous Phyitian, hath made one * intire book in the praise of Ptisana, which is a groat made of Barly: but all the vertues and properties thereof are now attributed vnto our Frumenty Alica, and that goeth away with all the commendation. * And yet a man may see how much more harmlesse it is than Alica. *Hippocrates* commended it only for a supping, as being slippery & easie to be taken, good to put away thirst, nor swelling in the belly, passing quickly and easily through the body, and such a kinde of meat as might alone of all others be giuen twice a day in a feuer to those who were vsed to it: so farre was hee in opinion from them who would famish all diseases, & cure them by * fasting & vtter hunger. Howbeit, he forbade to giue it whole in substance to be supped off, & allowed nothing but the very simple iuice and broth of Ptisane or husked Barly: neither allowed he it in the beginning of an ague fit, so long as the feet continued cold, for during that time he would not admit so much as a thin potion thereof. Now besides the Alica or frumenty made of Zea, there is another which commeth of the common wheat, more glutinous and better indeed for the exulceration of the wind pipes.

As touching Amylum or starch pouder, it dimmeth the eyesight, & is hurtful to the throat, and is nothing good to be eaten, contrary to the common received opinion. It staith the inordinat flux of the belly, refresheth the rheum into the eyes, it healeth vlcers, and cureth pushes, wheales, and blains, and restraineth fluxes of blood. It mollifieth the hardnesse growing in the eye-lids. To such as cast vp blood, it is vsually giuen in an egge. In pain of the bladder, halfe an ounce of Amylum made hot ouer the fire vntill it suer, with one egge and as much cuir as will go into three eg-shells, taken immediately after the bath or hot house, is a singular remedy: moreover, oatmeale foddren in vinegar, taketh away moles and freckles of the skin.

The

A The very ordinary bread, which is our daily food, hath an infinit number of medicinable faculties. Bread crumbs being applied with water and common oile, or els with oile of Roses, doth mollifie impostumes: & with honied water assuageth any hardnes, wonderfully. Giuen in wine, it is good to discusse and resolute. It is of force also to bind and knit where need is, and so much the rather, if it be giuen with vinegar. Also it is singular against the sharp & eager flux of fleame, which the Greeks call Rheumes: likewise for bruised places vpon stripes or blows; yea, and for dislocations. And in very deed, for all these purposes, leauened bread, called of the Greeks Autopyros, & downright made, is better than any other. Moreover, a liniment thereof applied with vinegar, is good for whitflaws and the callosities of the feet. Moreover, stale bread and bisket, such as sea-faring men do eat, being stamped & sod again, is good to bind the belly: for singing men and choristers who are desirous to haue a cleare voice, for such also as be subject to rheums falling from the head, it is the wholsomest thing in the world, to eat dry bread in the beginning of meals. The Sitanian bread, & that which is made of three months corn, being incorporated with hony, is a faire medicine to cure either the black prints remaining after strokes, or the scalling and pilling of the face. White bread crumbs foked either in hot or cold water, yeeld vnto sicke men a meat of light digestion. The same being applied with wine, cureth swelled eyes. And so it healeth the breaking out in the head, especially if dry Myrtles be put thereto. It is an ordinary thing to prescribe vnto them that are giuen to shaking, for to eat fasting bread foked in water, presently after they come forth of the bath. The perfume of bread burnt, taketh away all other euill smells that may be in a bed chamber: & being put into those Hippocras bags through which wines be strained, it altereth the naughty tast which they haue.

Furthermore, euen Beanes haue their properties which serue in Physicke: for being fried all whole as they be, and so cast piping hot into sharp vinegar, they help the collicke and pangs of the belly. Bruised and so eaten, or foddren with Garlick, they be excellent good against coughes that were thought past cure and remediless; yea, and imposthumes in the breast grown to suppuration; but the patient ought to feed thereof continually euery day. Also if one chew them fasting, and so apply them to a fellon, they are thought passing good either to ripen or to discusse the same. Boiled in wine, and so laid too, they assuage the swellings of the cods and priuy parts seruing to generation. Bean floure foddren in vinegar, doth ripen and breake all tumors: in like manner it dissolueth black bruised blood lying vnder the skin, and healeth burns. *M. Varro* is of opinion, that it is good for the voice. Bean stalks and bean cods burnt to ashes, and so incorporated with old Swines seame, is good for the Sciatica and all inueterat pains of the sinews. The very husks of beane alone foddren to the thirds, do stop the lask and running out of the belly.

The best Lentils be they that are most tender, and ask least seething: also such as drink much water. Lentils verily do dim the cie-sight, and breed ventosities in the stomacke: but taken in meat they stay the flux of the guts, and the rather if they be thoroughly foddren in rain water: but in case they be not fully boiled, they do open the belly and make the body laxatiue: the efcars or rofts remaining vpon cauterized or blistered sores, they break and make to fall off: & those vlcers which are within the mouth, they mundifie and cleanse. Applied outwardly, they appease the pains of all imposthumes, especially if they be exulcerat and full of chaps: and reduced into a cataplasme with melilote or a quince, they are singular for to repress the flux of humors to the eyes: but for to keep impostumes and tumors from suppuration, they are laid too with Barley groats, or the grosse meale thereof torried. The iuice of Lentils after they be foddren, is good for the exulcerations of the mouth, and the genitors: likewise with an addition of oile Rosat or Quince, for the inflammation of the seat or fundament. But if the parts affected and exulcerat do require stronger and sharper remedies, the same would be applied with the rinde of a pomgranat, and a little hony put thereto. And to the end that the said cataplasme shal not dry quickly, they vse to put thereto Beet leaues. Lentils foddren thoroughly in vinegar, serue for a cataplasme to be laid vpon the swelling kernels called the Kings euill, and other fell biles, whether they be ripe or in the way only of maturation. Applied with honied water, they be very good for any clifts and chaps: but with the pill or rinde of a pomgranat, for Gangrenes. In like manner, with barly groats they be appropriat for the gout, the kidnies, the naturall parts of women, for kibes, and such vlcers as be hardly brought to cicatrice. Thirty grains of Lentils swallowed down by way of Boile, are singular for the feeblenesse and dissolotion of the stomacke. In dysenteries or bloody fluxes, in the violent rage of chollerick humors which cause euacuations both vpward & downe.

* It groweth indeed commonly vpon new wals, although the name seemeth to come from *Mures*, i. Mice and Rats: rather than *Muri*, i. Walls. * This booke goeth now vnder this title, *De ratione vitæ in morbis acutis*. * Contra, quanto innocenter est alica. * He glanceth at *Diatritos*, i. fasting three daies together

downward, Lentils do effectuall their operation much more, if they be sodden in three waters. For which purpose also better it is to torrefie them first, and then to pound or beat them small, that they may be giuen to the patient as fine as may be, either by themselves alone, or els with a Quince, with Pears, Myrtle berries, wild Cichory, black Beets or Plantain. Howbeit, note thus much, That Lentils are nought for the Lungs, for head-ache, for all neruous parts, and the gall, and this ill property they haue besides, to keep the patient from sleep. Being sodden in sea-water, they are good for pusses and angry wheales, for *S. Antonies* fire, and the accidents that befall womens breasts; but if they be boiled in vinegar, they discusse all hard tumors, & the kings euil. They that haue but weak and bad stomacks, vse verily to put Lentils to thicken their portage and gruels, instead of Barly groats, and find thereby much ease. If they be halfe sodden in water, afterwards braied or stamped, & then let passe through a tamise, that the brans might be separat from the rest, they are thought very good for burns: but then, within a while as the cure goeth forward, they must be applied with honey also put thereto. Finally, if they be sodden in Oxycrat or water and vinegar together, they help the swelling bunch of the throat called Bronchocele.

There is a kind of marish or moory Lentils [called Ducks meat] growing of it selfe in standing waters. This herb is by nature refrigeratiue: in which regard, it serueth to make a liniment vsed for inflammations and hot imposthumes: but principally for all manner of goutes, either alone or mingled with Barly groats. The same hath vertue to knit & consolidat ruptures, when the bowels are fallen downe.

Moreouer, there be wild Lentils, called by the Greeks *Elelisphacos*, by others, *Phacos*. These be lighter than the tame Lentils which are sowed, bearing a smaller leafe, drier also, & more odoriferous than the other. Of which wild Lentils, there is a second sort, carying a strong smell: in somuch as the former kind is counted the milder. These Lentils haue leaues formed to the fashion of quince leaues, but that they be lesse and white, and commonly they are sodden branch and all together. Their medicinable vertues be, to bring down the monthly sicknesse of women, to prouoke vrines, and to heale the wounds occasioned by the venomous prick of the sea puffin or fork-fish. Now the nature of this fish is to benum and mortifie the place which is stricken. Of these Lentils and Wormwood, there is a drink made, good for the dysentery, or bloody-flux. The same taken with wine, draweth down womens fleurs that stay vpon them: but if their bare decoction be drunk, it will stay them when they flow immoderately. The herb alone applied outwardly, represseth the ouermuch bleeding of fresh wounds: it cureth the itch occasioned by the stinging of serpents. The decoction thereof in wine, doth mitigate the itching of the cods, if they be bathed and fomented therewith.

Our moderne Herbarists in these daies, doe call that in Latine *Salvia*, (*i.*) *Sange*, which the Greeks name *Elelisphacos*. An herb it is much resembling Mints, of a gray and hoary colour, and withall odoriferous. Being applied to the naturall parts of women, it fetcheth away the dead infant within the womb: it ridderth the ears also and festered vlcers of those wormes and vermin which breed therein.

Moreouer, there is a kind of wild Cich-peafe bearing leaues like to the other of the garden, and which be sowed, saue that their smell is strong & vnpleasant. If a man feed largely of them, they stir the belly and moue to the siege, they breed ventosities, cause the collicke and wringing of the guts. Howbeit, if they be parched or torrefied they are reputed the wholesomer.

The Cichling or pety Cich-peafe, is thought to be better and more wholesome to the belly than the other: but the meale as wel of the one as the other, doth heale the running sores & scales of the head: howbeit, the wild better than the rest. Moreouer, these ciches are taken to be good for the falling sicknesse, the swellings of the liuer, and the sting of Serpents. They procure womens termes, and prouoke vrine, and especially the grain it selfe rather than the leafe. The same are singular for tetters and ring-worms, for inflammations of the cods, for the jaundise & drop-sie. But all the sort of them be hurtfull to the bladder and kidnies, especially if they be exulcerat. For gangrenes and those morimall vlcers called *Cacoethe*, they be better, in case they be tempered with honey. Some there be, who for to be ridde of all kinde of Warts, take as many Cich-peafe as there be warts, and with euery one of them touch a wart, and that, vpon the first day after the change of the Moon: which done, they tie the foresaid Peafe or Ciches in a little linnen bag, and sling them away backward behind them: and they are perswaded that the warts will

A will be gone by this means. But our Latine Physitians are of opinion, That the blacke ciches which be called *Ram-ciches*, should be well and thoroughly sodden in water and salt: of which decoction they prescribe vnto the patient for to drinke two cyaths, in difficulty of making water, for to expell the stone, and rid away the jaundise. Their leaues and stalks of straw being sodden in water ouer a good fire, yeeld a decoction, which being vsed as hot as may be suffered, doth mollifie the callosities & hardnesse growing about the feet: so doth a liniment also made of the very substance it selfe, stamped and applied hot.

The Columbine ciches sodden in water, are thought to lessen and shorten the shaking fits in tertian and quartan agues. The black cich-peafe being beaten to powder with halfe the quantity of gall-nuts, and incorporat with sweet wine cuit, called *Passum*, and so applied, cureth the vlcers of the eyes.

As touching Eruile, somewhat I haue said already touching the properties thereof, when I made mention of it among other kinds of pulse. And indeed the old writers haue attributed as great power & vertue vnto it as to the Colewort. Being laid to with vinegar, it cureth the hurts that come by the sting of serpents, or the teeth of man & crocodile. There be writers of approved authority, who affirm for certain, That if a man doe eat Eruile fasting euery day, it will diminish and wast the swelling of the spleen. The meale of Eruile (as *Varro* reporteth) taketh away the spots and moles of any part of the body. And in truth, this pulse is singular to repress corrofue and eating vlcers: but aboue all, it is most effectuall in the sores of womens breasts: applied with wine, it breaketh carbuncles. Being torrefied and incorporat with hony, and reduced into an electuarie or bole, and so taken as much as an hazell nut, it amendeth the suppression or difficulty of voiding vrine, dissolueth ventosities, openeth obstructions, and helpeth other accidents of the liuer, the prouocations and proffers to the stoole without doing any thing: reuiueueth those parts that milke and feele no benefit or nutriment of meat, which they cal in Greek *Atropha*. In like manner it cureth shingles, ring-worms, and tetters, if it be first sodden in vinegar so applied, and not remoued vntil the fourth day. If it be laid too with hony, it keepeth bites from suppuration. A fomentation made with the decoction thereof in water, helps kided heels, & the itch. And it is generally thought, That if a man drink it euery day next his heart vpon an empty stomach, it will make the whole body looke with a better and more liuely colour. Contrariwise, the common opinion is, That it is not good to be eaten ordinarily as meat, for it moueth to vomit, troubleth the belly, lieth heauy vpon the stomach, and fumeth vp into the head:

C it breedeth ache and beauienesse in the knees. But if it haue lien many daies in sleepe, after that imbibition of water, it becommeth more mild, and is a most wholesom prouender for horse and oxen. The green cods of Eruile before they waxe hard, if they be stamped with their stalkes and leaues together, do colour and die the hairs of the head * blacke.

As touching wild Lupines, they be inferior to those which come of seed, in all respects, but only in biternesse. And verily there is not a thing more commendable, wholesome, and light of digestion than white Lupines, if they be eaten dry. They are brought to be sweet and pleasant by hot ashes or scalding water. Being eaten at meales vsually, they make a fresh colour and chearfull countenance. Bitter Lupines are very good against the sting of the Aspides. Dry Lupines husked & clenfed from their skins & applied to black & mortified vlcers, full of dead flesh, sodden in vinegar, discusse the kings euill, and the swelling kernels & impostumations behind the ears. The broth or collature of them being sodden with Rue and Pepper, may be giuen safely, although it were in an ague, to those that bee vnder thirty yeares of age, for to expell the wormes in the belly. As for young children who haue the wormes, it is good to lay Lupines to their bellie whiles they be fasting. All others are to take them torrefied, either by way of drink in a kind of wine cuit, or els in electuary after the maner of a *lohoch*. The same do giue an edge to the stomacke, and quicken the appetite to meat. The meale or powder of Lupines wrought with vinegar into a dough or paste, and so reduced into a liniment, and vsed in a bain or stoupe, represseth and keepeth down all wheales and itching pimples which are ready to breake forth: and of it selfe is sufficient to drie vp vlcers. It bringeth to the natie and liuely colour al places blacke and blew with stripes. Medled with Barly groats, it assuageth all inflammations. For the weaknesse of the huckle bone, the haunch, and loins, the wilde Lupines are counted more effectuall than the other. A fomentation with the decoction of these wild Lupines, maketh the skin more

* For that colour in old time was best esteemed, and thereby chaste Matrons were knowne from wanton harlots, who affected yellow haire. *Alex. ab Alex. c. 18. l. 5.*

more smooth and beautifull, taking away all spots and freckles. But if the same or garden Lupines be boiled to the height and consistence of hony, they do cleanse the skin from black morpew and the leprosie. These also if they be applied as a cataplasme, do break carbuncles, bring down, or els ripen the swelling kernels named the kings euil, and other biles and botches, which of their nature be long ere they gather to head. Boiled in vineger, they reduce places cicatrized, to their naturall colour, and make them look faire & white again. But if they be thoroughly foddren in rain water, of the collature that passeth from them, there is made an absterfue and scouring lie in manner of sope, most excellent for to soment, gangrenes, small pocks, & running vlcers. A drink made thereof, is singular for the spleene: and if hony be put thereto, it prouokes womens fleurs, which make no halt downward. Take raw Lupines, stamp them with drie figges and vineger into a cataplasme, and apply them to the spleen, it is an excellent remedy. The root also foddren in water, prouoketh vrine forcibly. Lupines boiled in water with the herb Chamæleon, do cure the diseases incident to sheep and other such smal cattell, if they do but thinke of this decoction. Let them be foddren in the mother or lees of wine, or mingle both their decoctions therewith: they do heale the farfins, scab, and mange of all other foure-footed beasts what fouer. The fume of them as they burne, killeth gnats.

Concerning Irio, I said before in the treatise of corne and pulse, that it was like Sefama, and named by the Greeks Erysimon, whereas the Gaules do call it Velarum. This plant brancheth very much, and beareth leaues like to Rocquet, but that they be somewhat narrower, and brings forth seed resembling that of Cresses. This Irio taken with hony in form of a lohoch, is excellent good for the cough, and those who reach out filthy matter from their chest. Given it is for the jaundise, the diseases of the loins, for the pleurisie, the torments and wrings of the collicke, and the fluxes occasioned by the debility and weaknesse of the stomacke. Applied in form of a liniment, it is singular good for the inflammations behind the ears, for the cancerous vlcers also, and the symptoms thereto belonging. Laid to the cods with water, and otherwhiles with hony, it altereth their distemperature of heat, and the inflammations whereto they are subject. And foueraigne it is for infants. Likewise a cataplasme made of it, with figs and hony, is singular for the accidents and griefes of the fundament, as also for the gout and pains of the joints. Taken in drink, it is an effectuall counterpoison. It cureth those who are short winded. Applied outwardly with old hogs-grease, it helpeth fistulous sores, so there be care had that none of it go into the vlcers.

* *res. n. 3* for
meant, i. Hor-
hound.
* He confoun-
deth (as it
should seeme)
the vertues of
Hormium,
i. Clarie the
hearbe, with
the graine cal-
led also Hor-
minum.

As for the graine Horminum, it hath a seed resembling Cumin, as I haue said before: otherwise it is like to * Porret: and groweth to the height of a span or nine inches. Two kindes there be of it: whereof the one hath a blacker seed than the other, and somewhat long. * This hath power to prouoke lust, and is much vsed for the pin and web, for the perle also in the eye: the other hath a whiter seed and rounder. Both the one and the other if they be stamped, draw forth pricks and thornes out of the body, if a liniment be made of them alone, and applied with water. But a cataplasme of the leaues with vineger, or alone by themselves, or else with honey, discusse and resolute biles without suppuration. In like manner they dispatch fellons, if they be taken before they grow to any head, and generally all tumors proceeding from sharp and hot humors. And thus much of grain.

A strange thing that Nature hath so ordained, That the very pestilent weeds which plague corne, should haue their vse in Physicke. For first and formost there is Darnel, which albeit Virgill termeth Infelix, i. unhappy, yet if it be ground and foddren in vineger, and so applied, it cureth tectars and dry scabs joined with a great itch: and the sooner doth it the deed, the oftner it is removed and changed. Darnell floure laid too, with Oxymell, cureth the gout & other pains. And to say a truth, the manner of this cure differeth from the rest. For the preparing of which medicine, the said floure must be ordered in this manner, & after this proportion: for euery sextar of vineger, it sufficeth to dissolue therein two ounces of hony; take then three sextars of this mixtion, and put thereto two sextars of Darnell meale, foddren to a thicke consistence: which done, temper all together, and apply this cataplasme to the grieved and pained members. The same meale draweth forth spoils of broken and shuiered bones.

A weed there is, called Miliaria, for that it killeth the grain Millet. Beat this to powder, and mingle it with wine, then poure this drench with an horne downe the throat of laboring jades: they say it will cure their gouts.

As

A As for Bromos[i. wild Otes] which the Greeks take for the seed of a certain spiked or eared weed, counted it is for one of the imperfections growing among corne, and may be ranged with the kinds of Otes: for blade and stalk, it commeth neere to wheat; it beareth in the haw or bea: certain grains hanging down, which resemble small locusts; the seed is good to be vsed in the cataplasms, into which barley and such like do enter; the iuice or liquor made of it, is singular for the cough. A weed there is which we named Orobanche, for that it choketh Eruiile and other pulse: some call it Cynomorion, for the resemblance that it hath to the cullions and pizle or genitall member of a dog. It riseth vp in a small stem without any leaues or blade: fatty it is and red: sometimes it is eaten alone; otherwhiles it is serued vp tender foddren, between two dishes, with other viands. Moreouer, there do ingender in pulse, certain little venomous vermins, who will pricke and sting their hands who are imploied in the plucking, yea and put them in danger of their life: a kind they are of these Solifugæ or Solpugæ. The remedies for all these, be the same which are set downe against Spiders, and Phalangia.

Thus much as touching all kinds of graine, as far forth as they concerne Physick. But this moreouer is to be noted, that of corne there be certain drinks made, as namely, Zythus in Egypt; Coelia and Ceria in Spaine; Ale and Beere and many more sorts, in Gaule and other prouinces. Now the froth or barme that riseth from these Ales or Beers, haue a property to keepe the skin faire and cleare in womens faces. But for the operation that Ale and Beere hath in them who drink thereof, I mean to passe them ouer here; for I thinke it better to proceed to the treatise of wine: but first I will discipher the medicinable vertues of trees, and begin with the vine.

THE TWENTY THIRD BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS

SECVNDVS.

The Proeme.

Thus far forth haue we gone ouer the upper face of the earth, and shewed what medicinable vertues there be in all kinds of graine, as well corne as pulse: as also what Physicke may be found in woorts and pot-herbs: yea and in those garden plants, which by reason of their faire floures and sweet odours, serue mans turne for garlands and chaplets. It remaineth now to speak of lady Pomona and her gifts, who certes commeth not behind dame Ceres with all her riches. And verily this Nymph and goddess Pomona, not content thus to protect, maintaine, and nourish vnder the shade of her trees, those fruits of the earth above named; but displeased rather and taking scorn, that such plants which grow farther from the Cope of Heauen, and began long after trees to come vp and shew themselves, should seeme to haue so many vertues: hath likewise furnished the fruits hanging vpon her trees, with their properties, and those of no small operation and effect in Physicke. And in truth, if we consider and weigh the cause aright, shee it was that afforded to mankind the first food from those her trees, inducing vs thereby to lift vp our eyes and looke to Heauen-ward: yea and shee giueth the world to vnderstand, that if Ceres and Flora both should faile, shee with her goodsonly were able euen still to sustaine and feed vs sufficiently. And to beginne with the Vine, which ought by right to be ranged in the highest ranke of all those plants that beare the name of Trees: This countifull Ladie not satisfied herein, that shee had done pleasure vnto man in furnishing him with noble perfumes, odours, and delicate Ointments, by means of the grape ver-

juice.

juice, the Vine-floure Oenanthe, and namely the wilde Vine Massaris in Africke (according as I have discouered more at large heretofore) hath therefore bestowed vpon Vines those medicinable vertues in greatest measure, and withall vnto men in this manner: Call to minde (quoth shee) how many benefits and pleasures thou receivest at my hands; Who is it but I, that haue brought forth Wine, that sweet juice of the Grape? Who but I, haue giuen thee Oyle, that daimie liquor of the Olive? From mee, come Dates and Apples: from mee thou hast all Fruits of such varietie, that impossible it is to number them. Neither doe I deale by thee as dame * Tellus doth, who bestoweth nothing vpon thee without labour and sweat of thy browes; nothing (I say) but before it doth thee any good, requirerth tillage by Oxe and Plough, thrashing with flail vpon the floore, or trampling of beafts feet vnto the mow, and then the Mill-stones to grinde it in: Such adoe there is, and so long a time first, before thou canst enjoy the benefit thereof for thy food. But contrariwise, whatsoeuer cometh from mee, is ready at hand; there needes no intreating of the Plough, nor any great labour and industrie to haue and in oyle my fruits, for they offer themselves of their owne accord: yea, and if thou thinke much of thy paines to climbe, or to put vp thy hand and gather them, loe they are ready to droppe downe and fall into thy mouth, or else to lie vnder thy feet. See how good and gracious Nature hath bene vnto vs herein, and how shee hath strewn with herselfe, Whether she should profit, or pleasure man more! & yet I take it, that she affected Commoditie rather than Delight.

For to come vnto the vertues and properties of the vine, The very leaues and tender burgeons thereof, applied with barley groats, doe mitigate the paine of the head, and reduce all inflammations of the bodie vnto the due temperature. The leaues alone of the vine, laid vnto the stomack with cold water, allay the vnto kinde heats thereof: and with barley meale, are singular for all gouts and diseases of the ioints. The tendrils or young branches of the vine being stamped and applied accordingly, drie vp any tumors or swellings whatsoeuer. Their iuice imicted or poured into the guts by a clyster, cureth the bloody fluxe. The liquor concreat (which is in manner of a gumme issuing from the vine) healeth the leproie and all foule tetter, scabs and manges, in case the parts affected were prepared and rubbed before with salniter. The same liquor or gumme is likewise depilatorie, for if the haire be often annointed with it and oyle together, they will fall off: but the water especially that sweateth out of greene vine branches as they burne, hath a mightie operation that way, inasmuch, as it will scatch off Warts also. The drinke wherein young vine tendrils haue lien infused, is good for those who reach vp and spit blood; as also for women who being newly conceived and breeding childre, haue many swannes come ouer their heart, and be eftsouenes subiect with faintings. The vine barke or rinde, likewise the dried leaues stanch the bleeding in a wound, yea and doe consolidate and heale vp the wound it selfe. The iuice drawne out of the white Vine being stamped greene, and Frankincense together, take away shingles, ring-wormes, and such like wilde-fires, if it bee applied thereto. The ashes of the vine-stocke, vine-cuttings, and of the kernels and skinnies of grapes after they be pressed, applied with vineger vnto the seat or fundament, cure the piles, swellings, fissures, chappes, and other infirmities incident to that part: but incorporate with oyle. Rosat, Rue, and vineger, they helpe dislocations, burnes, and swellings of the spleene. The same ashes strewed with some aspersions or sprinkling of wine, vpon S. Anthonies fire, without any oyle, doe cure the same: as also all frets and galls betwene the legges, and besides cat away the haire of any place. The ashes of vine-cuttings, besprinkled with vineger, are giuen to drinke for the diseases of the spleene; so as the Patient take two cyatts thereof in warme water, and when hee hath drunke it, lie vpon the spleene side. The very small tendrils of the vine whereby it climbeth, catcheth, and claspeth about any thing being punned and taken in water, staerth and represseth vomiting in those, whose stomacks are ordinarily to be heektilsh and soone to ouerturne. The ashes of vines tempered with old hogges greafe, is singular to abate swellings, to cleanse fistulous vlcers first, and soone after to heale them vp cleane: likewise for the paine of sinewes proceeding of cold, and for contraction and shrinking of the nerues: also for bruisings, being applied with oyle. Moreover, they cat away all excrescence of proud flesh about the bones, being tempered with vineger and niter: and last of all, mixed with oyle, they heale the wounds made by scorpions or dogs. The ashes of the vine-barke alone, cause the haire to come againe in a burnt place.

How grape verinice should be made, when the grapes are young and nothing ripe, I haue shewed in the Treatise of Perfumes and Ointments. It remaineth now to discouise of the medicinable vertues thereof: and first to begin withall, it healeth all vlcers that happen in moist parts, and namely those of the mouth, Tonsils or Almond-kernels on either side of the throat, and of the priuie members: the same is soveraigne for to clarifie the cie-sight: it cureth the asperitie and roughnesse of the cie-lids, the fistulous vlcers in the corners of the cie, the cloudes or films that shadow and coner the sight, the running sores in

A in any part of the body whatsoeuer: the corrupt and withered cicatrices or scars, and the bones charged with purulent and skinny matter. Now if this verinice bee too tart and eager, it may be delaid with honey or wine-cut: and so it is good for bloody fluxes, and the exulceration of the guts for those who reiect and reach vp blood, and for the Squinance.

Next after the wine-verjuice Omphacium, I cannot chuse but write of Oenanthe, which is the floure that wild vines doe beare, whereof I haue already made mention in my discours of ointments. The best Oenanthe is that of Syria, especially along the coasts and mountaines of Antiochia and Laodicea. That which groweth vpon the white vine, is refrigeratiue and astringent: being powdered and strewed vpon wounds, it doth very much good: applied as a liniment to the stomack, it is exceeding comfortable. A proper medicine it is for the suppression of vrine, the infirmities and diseases of the liuer, the head-ache, the blondie flux, the imbecility of the stomack, and the loosenesse proceeding from it: also for the violent motion of cholerick humours proceeding upward and downward. The weight of one obolus thereof taken with vineger, helpeth the loathing that the stomacke hath to meat, and procureth appetite. It drieth vp the running scales breaking out in the head: and most effectuall it is to heale all vlcers in moist parts, and therefore cureth sores in the mouth, priuie members, and the seat or fundament. Taken with hony and saffron, it knitteth the belly. The scurfe and roughnesse of the cie-lids it doth cleanse and make them smooth: it represseth rheume in watric eies. Giuen in wine to drinke, it comforteth and confirmeth feeble stomacks; but in cold water, it staies the casting and reaching vp of blood. The ashes thereof is much commended in collyries & cie-salues, also for to mundifie filthy and vlcereous sores; to heale likewise whitlawes rising at the naile roots, and either the going away of the flesh from them, or the excrescence thereof remaining about them. For to bring it into ashes, it must be torried in an Ouen, and so continue vntill the bread be baked and ready for to bee drawne.

As for Massaris, or the Oenanthe in Africke, it is imploied onely about sweet odours and pomanders: and both it, as also other floures, men haue brought into so great name, by making haste to gather them before they could knit to any fruit: so inuentiue is mans wit, and so greedy to hunt after nouelties and strange deuises.

CHAP. I.

D The medicines which grapes fresh and new gathered do yeeld. Of Vine branches and cuttings: of grape kernels, and the cake remaining after the presse. Of the grape Theriack. Of dried grapes or Raisins. Of Aitaphis: of Staphis-acre, otherwise called Pituitaria. Of the wild vine Labrusca: of the wild vine both white and blacke. Of Musts or new wines. Of sundry kinds of Wine, and of Vineger.

F Grapes that grow to their ripeness and maturitie, the blacke are more vehement in their operation than the white: and therefore the wine made of them is nothing so pleasant: for in very truth the white grapes be sweeter far, by reason they are more transparent and cleare, and therefore receiue the aire into them more easily. Grapes new gathered do puffe vp the stomacke and fill it with winde; they trouble also the belly, which is the cause that men are forbidden to eat them in feuers, especially in great quantity; for they breed heauinesse in the head, and induce the Patient to sleepe ouermuch, vntill hee grow into a lethargie. Lesse harme doe those grapes, which after they be gathered hang a long time: by which means they take the impression of wind and aire, and so become whoosome to the stomacke and to any sicke person; for they doe gently coole and bring the Patient to a stomacke againe. Such grapes as haue bin condite and preferred in some sweet wine, are offensive to the head and fume vp into the brains. Next in request to those abovesaid, which haue hangd a long time, be such as haue bin kept in chaffe: for as many as haue lien among wine-mare, or the refuse of kernels & skins remaining after the presse, are hurtfull to the head, the bladder and the stomacke: howbeit they doe stop a laske, and nothing is there better in the world for those that doe cast and reach vp blood: and yet those grapes that haue bin kept in must or new wine, are much worse than such as haue lien in the mare aforesaid.

Moreover, wine cuir, if they have come into it, maketh them hurtfull and offensive to the stomack. But if they must needs be preferred in some liquor, the Physicians hold them most whole some which haue bin kept in rain water, although they be least toothsome: for they do the stomack a great pleasure in the hot distemperature thereof; they be comfortable when the mouth is bitter, by occasion of the regurgitation of choler from the liuer and the burse of the gal; they giue great contentment also in bitter vomits, in the violent and inordinat motion of cholerick humors raging upward and downward, as also in case of dropisie, & to those that lie sick of burning feuers. As touching grapes preferred in earthen pots, they refresh and season the mouth which was out of taste: they open the stomack, and stir vp the appetite to meat: howbeit this in- convenience they bring with them, That they are thought to lie more heauy in the stomacke, by reason of the breath and vapor which exaleth from their kernels. If hens, capons, cocks, and such like pullen, be serued among their meat with the floures of grapes, so as they once tast and eat thereof, they wil not afterwards peck or touch any grapes hanging by clusters vpon the vine.

The naked branches and bunches wherupon there were grapes, haue an astrictiue vertue, and indeed more effectuall that way be such as come out of the pots aboue said. The kernels or stone within the grapes, haue the same operation: and in very truth, these be they and nothing els, whereby wine causeth head-ach. Being torrifed & beaten to powder, and so taken, they be good for the stomack. Their powder is usually put into the pot in manner of barley groats for to thicken broth and suppers, which are ordained for them who haue the bloody flux, who are troubled with a continual loosenesse following them by occasion of the imbecillity of the stomack; and for such as are ready to keck and heaue at euery little thing. Their decoction serueth very wel, to foment those parts which are broken out and giuen to bleache and itch. The stones themselves are lesse hurtful to the head or bladder, than the little kernels within. The same beeing driuen into powder, and applied with salt, are good for inflammations of womens breasts: the decoction thereof, whether it be taken inwardly, or vsed by way of fomentation, helpeth as well those who haue gone a long time with a dysentery, or bloody flux, as them who through imbecillity of stomack, do scoure and purge downward continually.

The grape Theriace, whereof we haue written in due place, is good to be taken as a counterpoison against the sting of serpents: & it is a common received opinion, that the burgeons and branches of that vine, should likewise be taken inwardly as meat, & applied outwardly for the same purpose: as also that both wine and vinegar which is made of them, is of singular operation to the same effect.

The dried grape or raisin, which they call *Astaphis*, would trouble the stomack, belly, and in- trails, but for the kernels that are within the stones, which serue as a remedy to preuent and cure those inconueniences; which being taken forth, raisins be thought good for the bladder: but particularly for the cough, those of the white grapes be the better. Soueraigne are they also for the wind-pipe and the reins: like as the sweet cuir which is made thereof hath a speciall power and vertue against the Hemorrhoids alone, of all other serpents. A cataplasme made of them, together with the powder of Cumin or Coriander seed, applied to the cods, cureth their inflam- mation. Likewise, if they be stamped without their stones or kernels, together with Rue, they are singular good for carbuncles and gouts: but before this cataplasme be laid to any vlcers, they ought before hand to be bathed and fomented with wine. Applied with their stones, they heale chilblanes and bloody falls, yea and ease the paines and wrings which accompany the bloody flux. Of them boiled in oile, there is a liniment made, which being applied with the outward rind of a radish root and hony, helpeth gangrenes: but if there be Panace or Loue-ach added thereto, the liniment cureth the gout, and confirmeth nails which be loose. Being chewed alone with some pepper, they purge the head and the mouth.

Astaphis agria, or *Staphis*, which some (though vntruly) call *Vva Taminia* (for this is a feue- rall kind by it selfe, growing vp with straight black stalks, and carying leaues like to the wilde vine *Labrusca*) beareth bladders or little cods more like than grapes, of a green color, & resem- bling eich-peale, within which is to be seen a three-cornered kernel: it waxeth ripe and begin- neth to change colour and looke black, at vintage time: whereas we know that the grapes of the *Taminian* vine be red: also we are assured, that *Staphis* acre loueth to grow in Sun-shine pla- ces, but the *Taminian* grape nowhere but in the shade. The said kernels I would not aduise to be vsed for a purgation, considering the doubtfull euent and danger that may insue of choking

and

A and strangulation: neither for to draw downe fleame and waterish humors into the mouth, for surely they be enemies to the throat and weasin pipe. The same, if they be done into powder, rid lice out of the head & all parts of the body besides: which they do the better & with more ease, in case there be *Sadaracha* or *Orpiment* among. In like manner, they kill the itch and the scabs. For the tooth-ache, they vse to be foddren in vinegar, for the disease is also of the ears, for rheums and eating cankers of the mouth. The floure beaten into powder and so taken in wine, is singu- lar for the biting and stinging of serpents: for I would not giue counsell to vse the seed, so exceed- ing hot it is and so fiery a nature. Some call this herb *Pituitaria*, and apply it as a liniment to the sores occasioned by the biting of serpents.

As for the wild vine *Labrusca* it carieth also a floure named in Greeke *Oenanthe*, whereof I B haue written enough before. The wild vine which the Greekes name *Ampelos Agria*, hath thick leaues, and those inclining to a white colour: the stalkes or branches be diuided by joints and knots, & the bark or rind is all ouerful of chinks & crenisses: it beareth certain red grapes much like vnto the berries wherewith they colour scarlet, which being stamped with the leaues of the same plant, and applied with juice of the oyle, are good to cleanse and beautifie the skin in wo- mens faces; and besides, do help the accidents and griets that may befall to the haunch, huckle- bone, and the loins. The root boiled in water, and so taken in two cyaths of the * wine of the I- land *Cocos*, doth euacuate watery humors gathered in the belly, and by consequence is thought to be an excellent drink for them who are in a dropsie. And this is the plant, which in my iudge- ment should be that vine which commonly is called in Latine *Vva Taminia*, rather than any C other. Vsed much it is for a counter-charme against all witchcrafts: and giuen it is to gargarise only with salt, thyme, and honied vinegar or oxymell, to them that spit and cast vp blood, with this caueat, To let none of it go down the throat: and therefore men feare to purge therewith, so dangerous it is thought to be. Another plant there is much like to this, called in Latine *Salica- strum*, for that it groweth in willow rews: and albeit these two carry diuers and distinct names, yet they be of the same nature and property, and be vsed to the like purposes. Howbeit this *Salicastrum* is taken to be more effectuall of the twain for to kill the scab, scurfe and itch, as well in men as in four-footed beasts, if it be bruised and applied with honied vinegar.

There is a certain wild white vine, which the Greekes call * *Ampelocela*, some *Ophiota- phylon*, others *Melothron* or *Pilothron*; some *Archezoftis* or *Cedroftis*, others *Madon*. This D plant putteth forth long and slender twigs, parted and diuided by certaine joints or knots, and these climb vp and clasp whatsoeuer they meet withall. The leaues grow thick and full of ren- drils or yong burgeons, as big as Ivy leaues, diuided & jagged in manner of other vine leaues: the root is white & big, like at the first to a radish, from which there spring certain thorns or spines resembling the buds of *Aparagus*: these yong sprouts foddren & eaten with meat, purge both by siege and vrine: the leaues and branches be exulcerating, and wil raise blisters vpon the body, and therefore applied with salt as a liniment, they be good for corne vlcers, gan-grenes, woules, and the old morrill sores in the legs. The seed or graine therof is contained within certaine berries hanging down thin here and there in small clusters, which yeeld a certain red juice or li- quor at the first, but afterwards it turneth to a yellow saffron colour: this know the curriers well E who dresse skins, for they vse it much. There is an ordinary liniment made therewith, for scabs, mange, and leprosie. The seed being boiled with wheat, and so taken in drink, causeth nurces to haue good store of milk. The root of this wild vine is very soueraigne, and serueth in right good stead for a number of purposes: first if it be powdered to the weight of two drams and giuen in drink, it is singular against the sting of serpents: it is excellent to scoure the skin of the face, to take away all spots and speckles, hecks and freckles, in any part of the body; the black and blew tokens of stripes, by reason of bruised blood lying vnder the skin; foul & vnseemly fver-skars, it reduceth to the fresh & naturall colour: these operations it hath, being boiled in oile: the deco- tion also is usually giuen in drink to those who be subiect to the falling euill: likewise to such as be troubled in mind & beside themselves: to as many as are giuen to dizzines & giddines of F the brain, and doween that euery thing turns round; but they must take the poise of one dram euery day throughout the yeare. The same root if it be taken in any great quantitie, * purgeth the fencies. But the principall and most excellent vertue that it hath is this, That if it be flam- ped with water, and so applied, it draweth forth spels of broken and shinered bones as well and effectually as the verie true *Bryonie*, which is the cause that some doe call it *White Bryonie*.

* Much like to our Maleney.

* Some take it to be *Bryonie*.

* For cataplasme to be put out of the seed and oyle of the root.

for there is another which is black, and of greater efficacie to the same purpose, if it be applied with hony & Frankincense. It is very good to resolute impostumes and biles which are in growing, and not yet come to suppuration; but if they haue continued and gather to an head, it bringeth them soone to maturation, and afterwards clenseth them. It bringeth downe womens monthly sicknesse, and prouoketh vrine. An electuary or lochoch made therof, to lick, and suffered gently to melt vnder the tongue and go downe leisurely, is singular good for such as bee short-winded and labour for breath: also for pleurisies or pains of the side, for conuulsions and inward ruptures. If one drink the weight of three oboli 30 daies together, it will waite and consume the swelled spleene. The same serueth in a liniment to be applied with figs to the excrescences or risings of the flesh ouer the naile, called Pterygia. Being laid too as a cataplasm with wine, it fetcheth away the after-birth in women: and taken to the weight of a dram, in honied water, it purgeth flegmatick humors. The juice of the root must be drawne before the fruit or seed be ripe: this juice either alone, or incorporat with Erule meale, if the body be annoited therewith doth illustrate the colour, make the skin soft and tender; and in one word it is such an embelishment, that it maketh any person better for the sale: * where by the way note, that it chafeth serpents away. [Moreover, the very substance of the root, if it be stamped with fat figs, doth lay the riuels and wrinkles of the skin plain and euene, if it be rubbed or annoited therewith: but then the party must walk immediately vpon it, a good quarter of a mile; for otherwise it will fret and burne the skin, vnlesse presently it be washed off with cold water. Howbeit the black wild vine doth this feat more gently and with greater ease, for surely the white setteth an itch vpon the skin. There is therefore a black wild vine, which properly they call Bryonia, some Chironia, others Cynecanthe or Apronia, like in all respects to the former, but only in the colour [of the root grape or berry] for it is black, as I haue before said. The tender sprouts & sions that spring from the root, *Droches* preferred to be eaten in a salad or otherwise, before the very crops and tender shoors of the true garden Sperage; and indeed they prouoke vrine and diminish the spleen far better: it groweth commonly in hedges among bushes and shrubs, and most of all in reed-plots. The root without-forth is blacke, but within of a pale yellow box colour; and this is of much more efficacie to draw out broken bones than the aboue-named white Bryony. Moreover, this peculiar property it hath besides, To cure the farcines or sores in horse necks and for this, it is thought to be the only thing in the world. Said commonly it is, that if a man do set an hedge or hay thereof round about a grange or ferm house in the country, there will no kites nor hawks, nor any such rauening birds of prey, come neere; so as the pullen and other fowl kept about the said ferme, shall be secure from their claws or talons. If it be tied about the ankles of a man, or the pasterns of laboring horses, vnto which there is a fall either of Phlegmatick humors, or of a blood, causing the gout in the one and the pains in the other, it cureth the same. Thus much concerning the sundrie sorts of Vines, and their properties respectiue to Physicians.

As touching Musts or new wines, the first and principall difference of them lieth in this, that some by nature are white, others blacke, and others again of a mixt colour between them both. Secondly, some Musts there be, whereof wine is made; and others, which serue only for cuit: but if we regard the artificiall deuises and the carefull industry of man about them, there be an infinit number of musts all distinct and different one from the other. Thus much may suffice to deliuer fully in generall terms concerning musts or new wines. As for their properties, There is no must or new wine, but it is hurtfull to the stomach, though otherwise pleasant to the veines and passages. Certes, if a man poure downe new wine hastily, without breathing or taking the wind between, presently as he commeth out of the bain or hot-house, hee doth enough to kill himselfe. Howbeit, of a contrary nature it is to the Cantharides, & saue those that are in danger by drinking them. A singular counterpoison is new wine in the lees, against all serpents, but principally the Hemorrhoids and the Salamanders. It causeth head-ache, and is an enemy to the throat and windpipes: whosome it is for the kidneys, the liuer, and the inward parts of the bladder, for it easeth them all of pain. But a singular vertue it hath against the venomous worm or flie Buprestis, about the rest: if one drink it with oile, and cast it vp againe by vomit, it is an excellent remedy for those who haue taken too much Opium: it helpeth those who are in danger of erudled milk within the body: such also as are poisoned with hemlock, envenomed with the poison Toxica & Doryenium. In sum, white new wine is not so powerful in operation as others.

* I see no reason of this clause here, but thinke it superfluous, according to some manuscripts.

Others. Likewise, the Must, whereof cuit is made, is pleasanter than the rest, & causes lesse headach. As touching the sundrie kinds of wine, which are exceeding many as also the vertues, and properties of euery feuerall sort in manner by it selfe, I haue sufficiently discoursed in a former Treatise. Neither is there any point more difficult to be handled, or that affoordeth greater variety of matter. And a man cannot readily say, Whether wine be more hurtfull or wholsome for our bodies? considering the doubtful euent and issue presently on the drinking thereof, for that sometime it is a remedy and a helpe, otherwhiles it proueth to be a mischief and a very poison. For mine owne part, according to my first design and purpose, I am to treat only of such things as Nature hath brought forth for the health and preseruauon of man. Wel I wote, that *Asclepiades* hath made one entire volume expressly, of the manner how to giue wine in drinke. Vpon which treatise or book of his, an infinit number there were who haue written their Commentaries. As for me, according to that grauity which becometh Romanes, and to shew affection and loue to all liberall Sciences, I will not discourse thereof as a Physician, but with great care and diligence write so distinctly, as a deputed iudge or arbiter delegat to determin of mans health, and the preseruauon thereof. To dispute and reason of euery feuerall kind, were a endles peece of work, and so intricat, as I wot not how a man should rid himselfe out of it, if he were once entred; so repugnant and contrarie are the Physicians one to another in that argument.

To begin first with the wine of Surrentum, our ancients haue held it simply for the best aboue all others. But our later and more modern writers, haue made greater account of the Albane and Falerne wines. In summe, euery one hath iudged of the goodnesse of wine, according to his owne conceit and fantasie: a most vnequall course of proceeding, without all reason and congruities, to pronounce definitively vnto all others that for best, that pleased and contented his owne tast most. And yet set the case and say, they were all agreed and of one opinion as touching the most excellent wines; How is it possible, that the whole world should enioy the benefit thereof, since that great lords and princes themselves haue much adoe to meet with pure and perfect wines, without one sophistication or other? In good faith, the world is grown to this abuse, that wines be bought and sold now at an higher or lower price, according to the name and bruit that goeth onely of the cellars from whence they come: whereas in truth, the wines were marred and corrupted at the first in the very presse or vatt, presently after the vintage and grape-gathering. And therefore it is, that now adaies (a wonderfull thing to be spoken) the smallest and basest wines are of all others least sophisticate and most harmelesse. Well, how fouer it be, and admit the noblest kinds of wine are most subject to those bruings and sophistication, which make indeed the ods that is; yet those wines beforenamed, to wit, the Falerne, Albane, and Surrentine, do still import and carrie away the victory and prife from all the rest, by the generall voice & constant sentence of all writers. As touching the Falerne wine, it is not wholsome for the body, either very new, or ouer old; a middle age is best, and that begins when it is fifteen yeres old, and not before. This wine is not hurtfull to a cold stomacke: but I cannot say of a hot stomack. If it be taken alone and pure of it selfe in a morning, and drunke fasting, it doth much good to them who haue bin troubled with a long cough, or vexed with a quartan ague. And verily, there is not a wine that stirreth the blood and filleth the veines so much as this. It staie the laske, & nourisheth the body. Howbeit generally receiued and beleueed it is, That this wine dimmeth the eyesight, and doth no good to the bladder and neruous parts. And indeed, the Albane wines agree better with the sinews. And yet the sweet wines that come from the vineyards of the same tract are not so wholsome to the stomack: but the harsh and hard austere wines of this kind, be in that regard better than the Falerne wines abouesaid. And in one word, these Albane wines charge not the stomacke any jot, nor yet fume vp in the head: nay, they restrain and repress the rheumaticke fluxions both of stomacke and guts. As for the wines of Cæcubum, they bee now past date, and none of them are made any more. But those of Setinum, that remaine still and be in some request, doe mightily aid concoction, and cause the meat for to digest. In a word, Surrentine wines haue most strength, the Albane drink harder, and the Falerne be more mild and nothing so piercing as the rest.

The Statane wines come not far behinde these abouenamed. As for the Signine wine, out of all question it is simply the best to bind the body, & stop a vehement flux: thus much for wines and their properties in particular. It remaineth now to speake of their vertues in generall.

First

First and foremost, wine maintaineth and fortieth the strength of man, engendreth good blood, and causeth a fresh and lively colour. And herein verily consisteth the principall difference betweene our temperat climat within the heart (as it were) and middle part of the world, from those intemperat Zones on either hand. And looke how much the distemperature of the two Poles, worketh in the inhabitants of those parts, and hardneth them to endure and support all kind of trauell: so much doth this sweet and pleasant liquor of the grape enable vs to abide and suffer the like labour. And because we are entred into this theame, note thus much moreouer, That the drinking of milke nourisheth the bones: of beere and ale, and such like, made with corne; feedeth the sinewes and neruous parts: but of water, maintaineth the flesh and brawnie muscles onely. Which is the cause, that such nations as drinke either milke, ale, beere, &c. or shere water, are nothing so ruddie of colour, nor so strong and firme to vndergoe painefull trauell, as those, whose ordinarie & familiar drink is wine. And in truth, as the moderat vse of wine comforteth the sinewes & helpeth the eyesight, so the ouer-liberal taking thereof offendeth the one, and enfeebeth the other. Wine recreateth & refresheth the stomack: wine stirreth vp the appetite to meat: wine allaieth sorrow, care, and heauinesse: wine prouoketh vrin, and chafeth away all chilling cold out of the body. Finally, wine induceth sleep and quiet repose. Moreouer, this good property hath wine, To stay the stomack & repress vomits, taken into the body: and without-forth applied with wooll embued and bathed therein, to dissipat and resolute all swelling apostumes. *Asclepiades* was so addicted to the praise of wine, that he bathed not to make comparisons & pronounce, that the power and puissance of the gods was hardly able to match and counteruaile the might and force of wine. Moreouer, this is to be noted, that old wine will beare a greater proportion of water than new, and prouoketh vrin more: although it withstand and allay thirst lesse. Sweet wines do not so much inebriate and ouerturne the brain, as others; but they stote aloft in the stomack: whereas austere and hard wines be lighter of digestion and sooner concocted. The lightest and smallest wine is that which soonest commeth to his age, and sheweth it most quickly. The wines which by age and long keeping, lay downe their verdure and become sweeter, are lesse hurtful to the sinewes than others. The grosse, fartic, and blacke wines, are not so good for the stomack; howbeit, they be most nutritive for the thin and bruske harsh wine nourisheth the body lesse; but yet more agreeable and nutritiue it is to the stomack. It passeth more speedily away by vrin, but sumeth vp so much the rather into the head. And take this for a generall rule once for all, not only in wines, but in any other liquors whatsoever, that be penetratiue, subtil, and piercing; That they be alwaies offensive to the head, howeouer otherwise they be piercing and passe soone away. Furthermore, wines that are laid vp in smokie places, therby sooner to seeme refined and old, are of all others most vnwholsome. But this and such casts were deuised by hucksters, vintners, & tauerners, after the wines were laid vp in their cellars. And now adaies good housekeepers also haue inuented means to renewe their wines, and make them seem fresh and new, after they haue by long lying gotten a fusty rotten tast, and gathered a mouldy mother of themselves, which is called *Caries* in Latin. And verily, our auncitors by vsing this teame, in wines ouerstale and kept ouer their due age, haue giuen vs counsell and taught vs sufficiently, how to take away this vnpleasant tast of wine, (i.) by smoake: for like as smoake eateth away and consumeth the moisture and mouldinesse in timber, which causeth rottennesse, so it doth in wines. But we forsooth, contrariwise are perswaded, that the bitternesse of smoake, when it hath caught the wine, maketh it to appeare stale & old. Such wines as be very pale and whitish, proue the better and more wholsome by age and long lying: the more excellent that the wine is and of the kindlier grape, the thicker and grosser it waxeth by age; and in this gathering turneth to a kind of bitternesse, which is hurtful to mans body. Also, as vnwholsome it is to mix, season, and coniect therewith some other wine, that is not so old, & so to keep or drinke them together. Each wine agreeth best with the stomack, and doth least harme, when it hath no other liquor nor tast, but the owne, and euery wine is most pleasant and delightfome when it is taken in due time, that is to say, neither old nor new, but of a middle age, which is the very floure. Such persons as would feed, and desire to be corpulent, or to keep their bodies soluble, and haue the riddance of their bellie at command, shall do well to drinke often at their repast: Contrariwise, they who feed ouermuch, and desire to be gant and slender, and withall, to be costliue, ought to forbear drinking at meales, so long as they eat, but after meat they may drinke moderately. To drinke wine vpon an emptie stomack fasting, is a new found deuise lately come

vp.

A vp, and it is most vnwholsome for the body, and namely for those who are to goe into the field for to fight a battell: for it hindereth the forecast of the mind, and dulleth the vigor and quicknesse of the spirit: fitter indeed to bring and lull men asleep in the bed of securitie: certes, it was a practise long agoe among such as desired rest and peace, and who loued to sleepe in a whole skin, for to drinke wine fasting: for so we read in *Homer*, how *Helena* that faire ladie, presented a cup of wine before meat. And hereupon came the prouerbe, That wine doth ouershadow and darken the light of wisdom & vnderstanding: verily we that are men haue this property aboue all other liuing creatures, and we may thank wine for it, That we drinke many times when wee be not dry nor a thirst. And therefore passing good it is to drinke fair water otherwhiles between. In like manner such as vse ordinarily to be drunk, & are lightly neuer sober, shall not do amisse to take a good draught of cold water presently vpon their liberall pouring in of wine, for it will forthwith dispat and disperse those fumes which cause drunkennes. *Hesiodus* giueth counsell to drinke wine somewhat delaied with water, for 20 daies before the rising of the Dog star, and as many after. True it is indeed, that Mere wine not delaied, is a remedy against hemlock, *Coriander*, the poyson *Aconite* or *Libard* baine, the venomous gum of the plant *Chamaeleon*, called *Ixia*, *Opium*, or the juice of *Poppie*, and *Quickefiluer* also, for such as haue been stung with Bees Wasps, and Hornets, the venomous spiders *Phalangia*, Serpents, and Scorpions, and generally, against all those poysons, which by reason of a cold quality moritifie naturall heat. But particularly it is a special countrepoyson against the venomous worms called Hemorrhoids & Presters, as also the deadly Mushrooms. Ouer and besides, singular good is wine against ventosities, gripings, and gnawings about the midriffe and precordiall parts about the heart: also for those, whose stomacks are ready euery while to ouerturne & cast: and where the belly or entrails be troubled with rheumatic fluxes. Semblably, wine a little delaied, is singular for the bloody flux: for such as be giuen to faint sweates, old coughs, and any violent fluxes either into the eyes or other inferior parts. But a fomentation of meere wine may be applied with a sponge to the left pap in the case of the Cardiacke passion, which is a feeblenesse and trembling of the heart. And in these cases white wine is better than any other, so it be of som reasonable age. Also it is found by experience, That horses and such beasts, either for the saddle and pack or draught, become very lusty, if their stones or genitors be bathed with wine hot: & when they be tired out, there is nothing (by report) better to refresh their courage, than to poure wine into them with an horne. Apes and Marmosets, and other four-footed beasts, whose feet are diuided into claws or toes, will not grow (men say) if they be vsed to drinke pure wine. But it is my purpose now to treat of the properties of wine, touching Physick and the cure of maladies. For gentlemen, well born and bred, who haue wherewith, and may haue what they wil, the wines of *Campaign* I count wholsomest, so they make choise of the smallest and the thinnest. But the common sort may be Physicians to themselves, and drinke euery man what wine he liketh most, and findeth best to agree with him. Howbeit to speake generally, the wholsomest wines both of the one sort and the other, and for all persons, be such as haue run through a strainer or *Ipocras* bag, and thereby lost some part of their strength. But this we must remember euery one of vs, That the liquor of wine gets all the force and strength that it hath by working, spurning, and seething (as it were) in the lees while it is Must. To mingle sundry kinds of wine together, can be good for none, either rich nor poore. Contrariwise, that wine is held most healthfull, that is of it selfe, and had nothing put thereto in the first vatt or vessell when it was new and meere Must of the grape, and the better will it bee, if there come no pitch into the barrells or vessells wherein it is tunned or filled. For as touching those wines, that are medicined with marble, plastre, and quicklime, what a man is he (were he neuer so healthy & strong) but he may be afraid well ynough to drinke thereof? wel then, wines either tunned vp or delaied with fi a water, be hurtfull to the stomack, sinewes, and bladder, as much as any other. As for the wines dressed and coniected with *Parrozzine*, they are thought to be wholsom for cold stomacks: but contrariwise, good they are not for such as are prone to vomit, no more than Must it selfe, or cuit, whether it be *sapa* or *passum* wine, wherein rosin hath bin newly put, is not for any man to drinke, for it causeth headach, swimings and dizziness in the brain: and no maruel if this mixture be called *Crapula*, for it intoxicateth the braine. Howbeit, these wines thus brued and dressed with rosin, are good for the cough and all rheumes; likewise, for feeble stomacks and the flux thereof ensuing, as also in dyfenteries or exulcerations of the guts, and their bloody flux, and last of all, for womens termes. In these kind

of

* Merum:

of wines thus mixed and sophisticated, the claret or deep red are more astringent and hot than all others. Lesse harme yet commeth of those wines which bee prepared with pitch alone, and nothing else. Neuerthelesse, we must not forget, that pitch is nothing else but the liquor that runneth from burnt Parrozin. And in truth, these wines that stand vpon pitch, doe heat the stomacke, helpe concoction, and purge offensive humours: they be good for breast and belly: also, comfortable to the matrice, for they doe allay the paines thereof, if the women haue no feauerous disposition; and doe cure Rheumes and Catarrhes, which haue continued their course a long time: they heale inward vicers, ruptures, spasms, and convulsions; impostumes bred within the interior parts, feebleness of the sinewes, ventosities, coughs, persuenesse, wheezing, and shortnesse of breath; and finally, helpe dislocations, beeing applied with vnwashed and greasie wooll, as it grew in the fleece. But note, that for all these infirmities abouenamed, the wine is more effectual, which naturally hath the tast of pitch, and therupon is called Picatum, than any other, that by artificiall meanes is dressed and prepared with pitch. And yet the wines made of the Heluenake grapes, if a man drink ouer-liberally of them, are wel known to trouble the head, notwithstanding they tast of pitch naturally. To come now vnto the disease, which we call the feuer or ague, this is certaine, That wine ought not to be giuen in that sicknesse, vnlesse the patient be well slept in yeres and aged, the disease chronike and of long continuance, or that the sicknesse begin to decline and weare away: for in hot, quick and sharpe feaues, which commonly be very dangerous, the sicke persons, be they young or old, ought to be restrained altogether from wine; except a man may evidently perceiue some remission or alienation of the disease: and the same rather in the night, than by day time; for certainly, the daunger is lesse by the one halfe, if they drinke wine toward night, and in hope to procure sleepe. Moreouer, women newly deliuered & brought to bed (whether they went the full time, or slipt an abortiue fruit vntime-ly) are not allowed in any case to drink wine: neither those persons who haue weakened their bodies with the immoderat vse of women, and thereupon fallen sicke: ne yet such as be subiect to the headach: no more than those, who during the fits of agues, feeble their legges and other extreame parts to be cold: or haue a cough ioined with their feauer. Moreouer, wine is an enemy to all those who haue a shaking and trembling of their joints, or be pained either in their sinewes or throat. Furthermore, in case the force of the disease be knowne to lie much about the * small guts and hypocondriall parts, the patient must altogether forbear to drink wine. They are to abstaine likewise when there is any hardnesse felt in the midriffe and precordiall parts: and when the pulses beat mightily, and goe faster than ordinarie. Semblably, in case the cramp doe draw the necke farre backe with a cricke, so as the head cannot stirre forward: or take the whole bodie so, as it is not able for to turne any way, but seeme as stiffe as if it were all of one peece; no wine must be giuen vnto such a patient. In like sort, those are forbidden to drinke wine, who are giuen to * vexing: and much more they, who in an ague labor for breath, and draw their wind hardly. But most of all must the sicke be kept from wine when their eies be set in their head, and their eye-lids stand stiffe and starke, with their eyes broad open: or bee shut, by reason that they are weake and heauie. Also, they must auoid wine (if they beewife) who in their sicknesse, as they winke or twinkle with their eyes, doe imagine that they sparkle & glitter againe: like as those who cannot lay their eyes together and close their lids, but sleepe open eyed. And euen so they ought to flie from drinking of wine whose eyes be red and bloud-shot-ten, or otherwise giuen to bee full of viscous and gummie matter. Neither are they permitted to drinke any wine, who estsoones flut and cannot pronounce their words perfectly, whether it bee, that their tongue bee ouer-light and spongy, or otherwise dull and heauie: no more than those, who hardly and with much difficultie, make water: who are affrighted suddenly at euery little thing that they heare or see: who are giuen to crampes and crickes: such also as otherwhiles lie benumbed, as if they were dead asleepe. And last of all, as many as shed their sperme involuntarily in their sleepe. True it is, and no man maketh any doubt, That the onely hope and right way to cure them, who in the Cardiake disease, for very faintnesse are troubled with the trembling and shaking of the heart and giuen vnto diaphoreticall sweats, consisteth in the drinking of wine. And yet in the manner thereof, Physicians are not agreed: For some are of aduise, not to giue it but in the very fit and extremitie of the disease: others againe prescribe it at no time else, but when the violence of the fit is past, and the patient at some ease. They who are of the former opinion, haue a regard to their sweat, for to repress it: but these haue

* Circa Jlin.

* Especially if it proceede from some hot or sharpe humor.

A haue an eye to the danger of the patient, being of this mind, that it is a more safer course to giue wine when the violence of the sicknesse abateth. And indeed of this judgement I see that most Physicians are. As touching the time to drinke wine, this is certaine, that good it is not but at meat: neither presently after sleepe, nor immediatly vpon any other drinke, which is as much to say, as neuer but when a man is drie and thirsty. Neither must a sicke man be allowed it, but in case of necessity or desperat extremitie. In summe, we graunt it to men rather than to women: to aged persons sooner than to young folke: and yet to a lustie young man, before a child: in Winter softer than in Summer, and to conclude, to such as bee accustomed thereto more than to those who haue not drunke thereof beforetime. A measure also and mean would be kept, in the allowance of wine, according to the strength thereof, and the proportion of water mixed therewith: and the common opinion importeth thus much, That to one cyath of wine it is sufficient to put two cyaths of water ordinarily. But in case the stomack be weak & feeble, so as the meat digest not nor passeth away downeward, meer wine is to be giuen to the patient, or at leastwise in greater proportion to the water.

But to return again to those artificiall and made wines, I haue heretofore shewed many sorts thereof: the making of them is at this day giuen ouer, as I suppose, and their vse needlesse and superfluous, considering that now we giue counsel & prescribe, to vse the very simples themselves in their owne nature, which go to their composition. Certes, beforetime the Physicians vpon a vain ostentation, because they would seem to haue their apothecary shops furnished with such variety, exceeded all measure in this behalfe: in so much, as they were prouided of a wine, made forsooth of Nauewes, bearing the world in hand, that it was singular good for militarie men, if they found themselves ouerwheared either with the practise or the bearing of arms, or in riding their horses: yea, and to say nothing of all the rest, they had the wine also of Iuniper: but is there any man so foolish, as to think and maintain, That Wormwood wine should be more profitable to our bodies, than Wormewood the hearb it selfe? What should I stand vpon the wine of dates; among others of this range, considering that it causeth head-ach, and is good for nothing els but * to ease the costuenesse of the body, & for such as reach vp bloud? As for that which we called * Bion, I cannot see or say, that it is an artificiall wine: for surely, al the art and cunning that goeth to the making of it, lieth in this only, That it is made and huddled vp in hast: & yet profitable it is for a weake stomack readie to ouerturn, or that is not able to concoct and digest the meat within it, wholesome for * women with child: comfortable to those who be feeble and faint: good for the palsey, the shaking of the lims, the swimming and giddines of the head, the wrings and torments of the belly, and the gout Sciatica: moreouer it hath the name for to haue a singular vertue to helpe in time of plague, and to stand them in great stead who are pilgrimes and traouellers into far and straunge countries. Thus much may suffice for Wines.

Moreouer, say that wine be turned, corrupted, and changed from the owne nature, yet it leaueth not to retain certaine vertues and properties requisite in Physicke: for vinegre also is medicinalle. Exceeding refrigeratiue it is, & cooleth mightily: howbeit, no lesse vertue and force it hath to discusse and resoluere: an euident proofe whereof we may see in this, That if it be poured on the ground, it will some and cast a froth. Concerning the manifold operations that it hath in composition with other things, I haue written oftentimes already, & wil write stil as occasion shall serue. But vinegre, euen taken alone by it selfe, fetcheth the stomack & appetite again to meat, and staieth the yex or hoecquet: and if it be smelled vnto, it stineth immoderat sneezing. Being held in the mouth, it preserues folk from fainting with extreme heat, while they are in the bain or hot house. Of it and water together there is made Oxyerat, which is a drink more mild than vinegre alone. And the same with water is comfortable to those who vpon the Suns heat haue gotten the headach or a day-feuer and be newly recovered: being vsed also in the same sort with water, it is counted most wholesome for the inflammation or rheum of the eies. A fomentation with oxyerat or water and vinegre, is singular good vpon * burns, scaldidgs, or rising of the pimples. In like maner it cureth the leprosie, scurfe, and dandruffe, running vlcers and scabs, bitings of dogs, stinging with scorpions, scolopendres, and hardishrews; and generally, it is good against all prickes of venomous beasts, or pointed darts, and any itch whatsoever. Likewise against the biting or prick of the * Cheeslip or Many-foot worme. Applied hor with a sponge to the seat, it is singular for the infirmities of the fundament. But for this purpose there must be a decoction or fomentation made, with three sextars of vinegre, whereunto there should be put of Sulphur

* Contrarie to Diastordides, who giue it to Celliac & dysenterich.

* Troubled with the and paymas, a corrupt and deprauate appetite, longing after this and that, and not alwaies the best things.

* Post ordinem, Some read hispidius, after the sucking of Horse leeches.

* Multipeda, called otherwile Sept.

or Brimstone two ounces, or a bunch of Hyssop, and then set ouer the fire for to boile together. In case of much effusion and losse of blood, which ensueth and followeth those who are cut for the stone, or any thing els taken out of the body; ther is nothing better than to foment the place without forth, with the strongest vinegre that may be had, in a sponge, and then to take inwardly in drinke 2 cyaths of the same: for surely it cutteth and dissolueth the cluttered blood lying within forth. Vinegre taken inwardly & applied outwardly, cureth the filthy tetter called Lichen. Being ministered by way of clyster, it knitteth the belly, and staith al rheumatick fluxes that haue taken a course by the guts and entrails. And the same helpeth as well the fall and slipping downe of the Longeon or fundamente, as the laxitie and hanging forth of the Matrice. An * old cough it restraineth: the rheumes also and catarrhes it represseth, which light on the throat and windpipe: it openeth the passages in them who labor for breath, & canot take their wind but sitting vpright: it confirmeth also the teeth loose in the head: many it hurteth the bladder, and doth harme in all infirmities of the sinewes. The Physicians were ignorant heretofore of the soueraign vertue that vinegre had against the sting of the serpent called Asp, until by a meere chaunce they came to the knowledge hercof. And thus stood the case: It fortuned that a certaine fellow carying about him a bottle of vinegre, trode vpon the said adder or serpent, that turned vpon him againe and stung him: howbeit he felt no harme at all so long as he carried the vinegre: but so often as he set the bottle downe out of his hands, the sting put him to sensible paine. By which experiment it was found and knowne, that vinegre was the only remedy, and so with a draught therof he had help out of hand, and was cured. But behold another prooffe and triall thereof. They that vse to suck out the poyson of venomd wounds giuen by serpents and such like, vse no other collution to wash their mouths withal, but only vinegre: certes, the force of vinegre is such, that it conquereth not only the strength of our viands & meats, but also many other things: for the very hard rocks, which otherwise it was vnpossible to cleaue before with the violence of fire, soone breake and giue way, when vinegre is poured aloft. This singular gift moreouer it hath, that no liquor in the world giueth a better tast to our meats and fauces, or quickneth them more than vinegre doth: for which purpose, if it be ouerharpe and strong, there is a means to mitigat and dull the force thereof, either with a toft of bread, or some wine: againe, if it be too weake and apalled, the way to reuiue it againe, is with Pepper or the spice Laser: but nothing moderateth it better than salt. And to knit vp and close this discourse of vinegre, I cannot forget nor ouerpasse one rare and singular accident that befell of late: *M. Agrippa* in his later days was much troubled and afflicted with a grievous gout of his feet, and being notable to endure the intollerable paines therof, took counsell of a certaine leech, some bold and venterous Emperick, who made great boast of his deep skill and admirable knowledge (for the Emperour *Augustus Caesar*, whose daughter he had espoused, he made not acquainted with the matter,) who gaue him counsell to bath his legs with hot vinegre, and to sit therein about his knees, at what time as his disease tormented him most: true it is indeed, that he was eased of his paine by this means, for he lost the very feeling of his feet. Howbeit, *Agrippa* chose rather to be paralyticke in some sort, and to want both vse and fence of his legges, than to abide the extremities of his gout.

CHAP. II.

¶ Of vinegre Scyllitike. Of Oxymel. Of the double cuit wine Sapa. The lees of wine: dregs of vinegre: and of the foresaid cuit.

THE vinegre of Squilla or sea-Onions, called Scellinum, the elder it is and longer kept, the more is it esteemed. This vinegre, ouer and aboue the other vertues of common vinegre before rehearsed, hath this property, To helpe the stomacke, in case the meats lie souring and corrupting therein: for no sooner doth a man tast thereof, but it dispatcheth and riddeth away the foresaid inconuenience: moreover, it is good for them that are giuen to vomit, fasting, in a morning: for it hardeneth the throat & the mouth of the stomacke which is ouersensible, & knitteth the same. It causeth a sweet breath, confirmeth the flesh about the gums, fasteneth the teeth which are loose, and maketh a bodie look with a fresh and liuely color. Being gargarized, it draweth away and doth euacuat those grosse humors which caused hardnesse of hearing, and

openeth

A openeth the auditory passages of the ears; and so by consequence clarifies the sight of the eyes. Soueraigne it is besides for those who haue the falling sicknesse, and who are troubled in mind by occasion of melancholy. It cureth the turning and dizziness of the braine, the suffocation or rising of the mother. It helpeth such as be sore and bruised with dry blowes, such as are false headlong from high places, and thereby haue cluttered blood gathered within their bodies: as many also as haue the infirmity or weaknesse of sinews, or otherwise be diseased in the kidnies: howbeit offendue it is to those that haue any vlcere either within or without.

Touching the syrrup Oxymel, *Diouches* saith, That the ancients in old time prepared and tempered it in this manner. They tooke of honey ten pounds, of old vinegre five hemines, of bay salt one pound, of Saucerie three ounces, of sea water five sextars: These together in a kettle they did set to boile, and let them haue tennewalms ouer the fire: then they lifted the pan from the fire, poured this liquor out of one vessell into another, & so kept it for their vse: but *Asclepiades* comes after, disproueth all the maner of this composition, and withall condemneth the vse thereof for the physicians before histime, feared not to prescribe it to be drunk euen in feuers; and yet both he and all, do confesse and agree, that this was a good drink against the venomous serpent called Seps: also for them who were poysoned with Opium, [i. the juice of Poppey] or with the gum Isia, which commeth from the hearb Chamæleon. Moreouer, they all commend it to be gargled hot for the squinancy, for the paine and deafnesse of ears, for the accidents and infirmities of the mouth and throat: like as at this day we vse in all these cases, the sharpe brine or pickle called Oxalme; which if it be made of salt and new vinegre that is fresh and quick, it is better in operation.

C As for the cuit named in Latine Sapa, it commeth neere to the nature of wine, and in truth nothing els it is, but Must or new wine boiled til one third part and no more do remain: & this cuit, if it be made of white Must is counted the better. Vse there is of it against the flies Cantharides and Buprestes: against the worms breeding in Pine trees, named thereupon Pityocampæ, against Salamanders, and generally all those beasts whose sting or tooth is venomous. If a woman drink thereof, together with scallions or such bulbs, it sendeth downe the after-burden, and expelleth the dead infant out of the womb. And yet *Fabianus* mine author saith, That it is no better than a very poison, if a man drink it fasting presently after he is come out of the bain.

D A consequent and appendant to these foresaid things, is the lees of wine; that is to be considered according to the wine from whence it commeth: and verily the lees of wine are so strong, that oftentimes it ouercommeth and killeth those, who go downe into the vats & vessels wherein the wine is made. But to know and prevent the danger thereof, this experiment is found; namely, to let down a candle into the said vat: for so long as it will not abide light, but goe out still, dangerous it is for a man to enter into those vessels. And yet wine lees without any washing at all, goe into the composition of many medicines. Take wine lees a certaine quantity, and of the floure de-lis or Ireos root a like weight, conorporat them together into a liniment: singular it is to annoynt the small pocks and such like cutaneous eruptions. The same either drie or wet, may be applied with very good successe to the places stinged with the venomous spiders called Phalangia; to the inflammations also of the genitoirs or priuy members; to the paps, or any other part of the body whatsoeuer. Now for the better preparing therof, it ought to be sodden in wine, together with barley meale and the powder of frankincense; which done, to be burned and so dried. And to know whether it be sufficiently sodden or no, make this triall: If you touch it neuer so little at your tongues end and so tast thereof, when it is thoroughly cold, it will seeme to bite and burne it, if it haue had sufficient boiling as it ought: but it soone loseth the heat and force, if it be not kept in a place well enclosed: by the said burning, it commeth to be much more stronger in operation. Sodden with figgs, it yeeldeth an excellent decoction to repress tetter, shingles, and such like wild fires; to scoure away also scurfe and dandruffe: & in that sort either applied as a cataplasme or fomentation, it cureth the leproie and running skals of the head. Being taken in drinke, especially raw, it is a soueraign countrepoyson for such as haue eaten venomous mushrunes. Boiled and washed, it is mingled with collyries which serue for the eyes. A liniment thereof cureth the accidents that befall to the cods and genitoirs. Taken in wine, it helpeth the strangury, and giueth them ease who otherwise could not pisse but by drop-meale. Lees of wine, after it hath lost the caustick operation and life that it had, will serue very wel for a good lie or water to cleanse the skin of our bodies, and to wash or scoure clothes: and
